

RED ALERT

Red Alert is an attempt to map the global fight against money laundering; a kind of travel guide through the teeming jungle of crimes, risks, regions, countries, criminals, terrorists, cases, banking products and services, laws and standards and money laundering programme design across the world.

In this book the following are comprehensively examined.

In Part 1 - Crime Related Materials:

- All predicate offences to money laundering
- Businesses and professions posing an increased risk of money laundering
- Regions and countries posing increased money laundering risks, and country risk methodologies and sources
- Major lines of banking businesses, including retail and commercial, cards, correspondent and private banking, brokerage, investment banking and asset management, as well as particular money laundering risks and potential vulnerabilities
- Major money laundering related laws, regulations and standards

In Part 2 Crime Related Cases, with more than 500 case examples and profiles:

- 250+ profiles of the most dangerous and deadly organised criminal gangs and terrorist groups, including details of the most reprehensible terrorist attacks
- 150+ criminal case profiles including landmark corruption, fraud, market abuse and drug trafficking, organised crime and terrorist financing cases
- 100+ Enforcement cases against financial institutions

...and much more.

"Amazing amount of information"

Lord James Sassoon, Former FATF President 2007/8

"Impressive...a wealth of information"

Boudewijn Verhelst, Chair Egmont Group until 2013

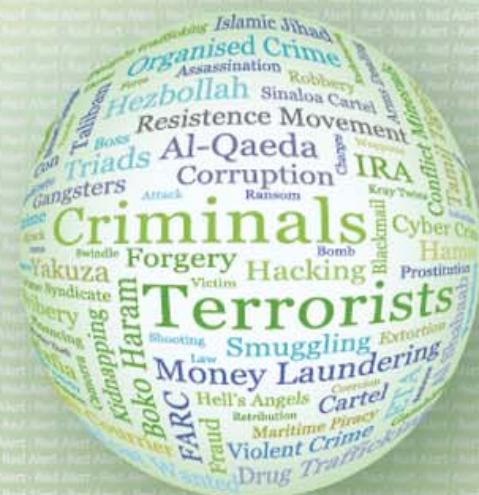

"The ultimate guide to ML detection and prevention"

2014 - Issue I

By John Cusack

Red Alert

Author's Note

Dear Reader,

I like to think of "Red Alert" as a personal travel guide through the teeming jungle of crimes, risks, regions, countries, criminals, terrorists, cases, banking products and services, laws and standards and programme design relating to the World of Money Laundering Prevention.

As a money laundering professional you are faced with an increasingly difficult set of tasks and an environment that is complex and dynamic. As such learning holds the key to success and will provide its own rewards. As Benjamin Franklin once said, "For the best return on your money, pour your purse into your head."

I hope you will find this both of interest and of use, in placing your work in a broader context and in navigating through the challenges of your own role and in refining the nature of your contribution.

As you read the Book, either from start to finish or by focussing first on particular areas of interest, consider the words of Confucius, "Learning without thought is labour lost; thought without learning is perilous."

The Book is right up to date to the end of 2013. At the end of the Book I have included important developments to the end of March 2014.

John Cusack - March 2014

About the Author

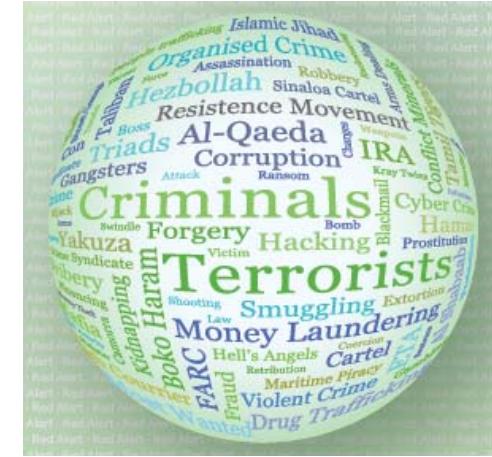

John Cusack is one of the World's longest serving Money Laundering Prevention Heads, joining UBS over 20 years ago, as a qualified English Lawyer, undertaking senior roles in both Legal and Compliance across much of the firm, including in Investment Banking, Correspondent and Commercial Banking and Retail Banking and

Wealth Management. He led UBS in its efforts in managing and mitigating money laundering risks as its first Global Head of Money Laundering Prevention, Sanctions Compliance and Anti Bribery and Corruption by both designing appropriate programmes and ensuring operational effectiveness.

John Cusack has recently agreed to take up a similar position at Standard Chartered Bank PLC as Global Financial Crime Head which will commence later in 2014.

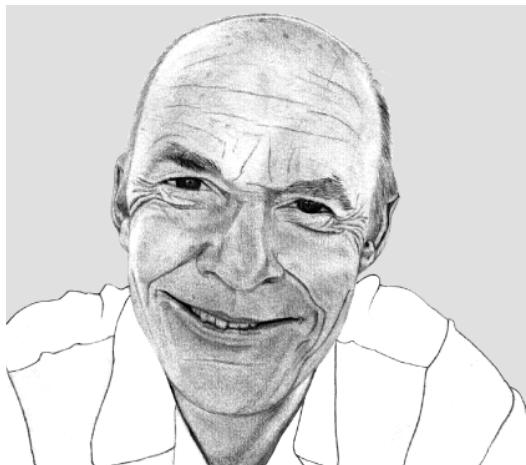

John Cusack has acted as a Chairman and has been a constant member of the industry leading Wolfsberg Group of International Banks for more than 10 years and has led and contributed to numerous Wolfsberg initiatives. He has regularly provided advice to law and policy makers, law enforcement agencies and colleagues in the private sector.

Red Alert

**Money Laundering Cases and Materials
for Money Laundering Prevention Professionals
2014 Edition - Issue 1**

By John Cusack

This book is dedicated to the hard work of all those involved in money laundering prevention and in particular to one of its brightest sons, and so to the memory of
MATTHEW COOPER

On 29 March 2011 we lost Matthew Cooper, known to many in the world of money laundering prevention as one of its most dedicated students and gifted teachers. To quote from the website established in memory to Matt, “the AML community lost one of its most knowledgeable and colourful members, someone who was universally liked and respected, a rare feat in our business.”

Matt had worked in both public (for the UK government in many roles, including fraud prevention at the sharp end and in the civil service at the smart end) and with the private sector with Barclays as Group AML Head and as deputy Global AML Head at UBS and then latterly at AMEX. Matt had also been one of the most influential and dedicated contributors to the Wolfsberg Group as well as with other industry bodies championing and always working together to find common solutions and practical ways to move things forward. In all of these roles, Matt was infectious and passionate about his work but also had time for colleagues and would listen and provide experienced and wise counsel whenever it was needed or whenever it was sought.

To many Matt will always be a friend; one sorely missed but whose lasting contributions reminds of his gifts and his unique talents. This book was inspired together with Matt Cooper and it is also for this reason that I dedicate this book to his memory.

Acknowledgements

Much of the information that forms the basis for the content of this Book comes from the public domain. The sheer amount of information that is publicly available is staggering but for professionals on the front line, their ability to locate, read, digest and consider the importance or otherwise of much if this information is severely limited. I have unashamedly relied on information and publications from the FATF, the World Bank, the UN, the IMF and the OECD as well as many other international, regional, national and local bodies, both public and private, that have reputations for both integrity and accuracy. I have also relied on information from the world wide web, in particular from Wikipedia and other sources where I feel this is useful and informative.

I then take a large step back and tell it as I see it. I have used a mosaic analysis, undertaken by some securities research professionals, building up from many sources as complete a picture as I can about our targeted subject, and in so doing providing greater insight. This is attempted but how this information is presented and how this is reshaped to provide the reader with an interesting read is the product of the many experts and contributors from UBS and elsewhere but ultimately the responsibility of the Author. As such, nothing in this book should be attributed to UBS and UBS does not guarantee the accuracy of the data nor necessarily agree with any of the contents or contributions.

Whilst I have tried to author a great deal of this book, the subject and the task is too great for any one person. I have relied upon an original concept discussed with my dear friend and departed colleague, Matt Cooper, and from the many experts and professionals at UBS. In particular all my senior AML team, including Jonathan Shih, my successor and Global Head of AML, Elaine Banar, Matt Chapman, Patricia Sullivan, Mike Bixon, Jean Marc Futterknecht, Elodie Chalmers, Tara Loftus, Pierre Grumbacher, Rainer Hoerning and Kevin Daynes. I would also like to thank the following UBS AML Team members for their valuable contributions including, Andrew Clayton, Florian Michel, Chris McNeil and Erik Zorteia from the Asian Team, Ulrich Ehrlsam, Martin Rimann and Corinne Marbacher from the Swiss team, Dominic Elsby, Mark Nelson, Dan Riddle and Netsanet Solomon from the UK team and Robert Berg and Priti Singh from the Americas team. I would also like to thank Jonathan Bibby, Steve Livermore and Anu Sharma from UBS Compliance for their contributions. I also appreciate contributions from former UBS experts, Joe Scavo, Sheryl Cottrell, Sam Rahman, Abnash Sagoo and Mark Starbuck. Special mention goes to the AML Compliance Education & Training team, including Derik Riesche and Christina Aur and an extra special thank you to Ramona Strelbel, Tom Duckmantion, Jigna Rathod, Hanna Patel, Shamayim Watson and Frances Cusack. I would also like to thank all those people who agreed to be interviewed or who have provided their opinions on certain aspects covered by this Book. I have been very fortunate to be able to benefit from the deep knowledge of many across the money laundering prevention profession, from private sector specialists, to law and policymakers, regulators, investigators and NGOs.

I would also like to thank Bernadette Jacobs, Victoria Meyer and Krina Patel for their administrative production and design and illustrative abilities respectively without which this book could not have been created or published and I would also like to express my appreciation to Andrew Williams, former UBS Global Head of Compliance and Markus Diethelm, UBS General Counsel for their continuous and wholehearted support for the AML Programme and team at UBS and the work that we do. I would also like to thank Hans-Peter Bauer and Neil Stocks for both their intelligence and integrity and from whom I have learned and been privileged to benefit from their advice and opinions over most of my professional career.

I also acknowledge the reader, those of you with the spirit of enquiry, the knowledge and the dedication and the tenacity to work and take an interest in money laundering prevention. Your tasks are important, difficult sometimes dangerous and mostly underappreciated, but not by your peers and colleagues and not by those that understand truly what you do. If you agree, disagree, wish to add or comment on any aspect of the contents of this book you are encouraged and welcome to do so.

Finally I would also like to thank my parents Brian & Anne Cusack for their constant support and to my children, Tomas & Hannah Cusack, for their patience as I worked on the book, and for being themselves today, tomorrow and always.

Introduction

This Book is intended to serve as a comprehensive source of information for money laundering professionals that wish to better understand, establish or improve their money laundering, terrorist financing, fraud, sanctions, bribery and corruption prevention frameworks (hereafter referred to as money laundering). These issues are of utmost importance and increasingly so, as the international community is relying on money laundering professionals to assist in successfully preventing, detecting and reporting money laundering in order to fight the devastating economic and social consequences of these criminal activities.

No Financial Institution worthy of its license, and mindful of its reputation and the risks, both criminal and civil that exist will deal knowingly with the proceeds of crime. More than that a financial institution will want to assist government authorities in every way in disrupting criminal funds, interdicting criminal flows and gathering intelligence to follow criminal trails. In addition to following the requirements by anti money laundering standard setters, as presented for compliance by applicable laws and regulations, Financial Institutions are faced with the challenge of designing appropriate AML Programmes which respond not only to the law, but should be based on the financial institutions own business activities but also reflect the changing threats posed by criminals and terrorists, to societies priorities championed by various stakeholders and to the pace of change within the Financial Services Industry.

This challenge is not all straightforward and requires a profound understanding of criminal behavior, the actors themselves, their criminal activities and in particular their attitudes and methods used in carrying out their crimes and laundering the proceeds of these crimes. In this criminals have a serious information advantage. As Sun Tzu wrote in the Art of War, "If you know the enemy and yourself, you need not fear the result of a hundred battles. If you know yourself but not the enemy, for every victory gained, you will also suffer a defeat. If you know neither the enemy nor yourself, you will succumb in every battle."¹

The Book is intended to reduce the criminals advantage, to alter the current imbalance and to get to know the criminal and his ways better. They provide money laundering prevention professionals, those that design, implement and test and for those that are also interested in combatting money laundering on a day to day basis with a comprehensive basis to improve both their understanding and ultimately improve effectiveness.

This Book is divided into **2 Parts** each divided into **4 Sections**, with, **5 Recommendations to "Effectively" combat Money Laundering; Money Laundering Facts and Figures; and What is Money Laundering?** providing an introduction to Part 1.

Part 1

Section 1 starts by looking at each of the **predicate offences to money laundering**, recognising that whilst the motive for economic crime, for money, may be similar there are many differences that set each of these crimes apart and make them attractive to criminals. For each, a look back through time provides the context in which to place criminal activities and relevant statistics aim to show the scale and size of the profits earned by the criminals, why criminals find these crimes so attractive and how criminals launder their money.

Section 2 focuses on **money laundering risks**, those that a money laundering prevention professional should be most concerned about and is divided into 4 Sub-sections.

Sub-section 1 contains specific information from **FATF, the US and the EU and then from the Wolfsberg Group** and other sources focussing on the main areas of inherent money laundering risk, customers, products and services and the risk of distribution or channel risk, geography and country risks.

Sub-section 2 focuses in more detail on the main **Customer** types that pose increased risks.

Sub-section 3 analyses in more detail the core **Products and Services** via the main business operations conducted by Financial Institutions. For each of these major lines of business, the most important risks are identified alongside distribution or channel risks as well where appropriate alongside key scenarios identified that may pose the greatest risks and may need to be addressed.

Sub-section 4 deals with **Geography or Country Risk**, looking at methodologies, examples and many of the most important sources, in order to identify relative risk classifications between Countries. Country Profiles themselves particularly countries that are significantly vulnerable and/or exposed to money laundering and/or where terrorist groups or organised criminal gangs operate or call home are included in Part 2, Section 5 (see later).

Section 3 provides a comprehensive guide to the **most important legal instruments**, the international conven-

tions and treaties that formulate the necessary political agreements and indicate political will to fighting serious crime and on the proceeds of and financial facilitation of crime. This is supplemented by an overview of work conducted over the years by the Financial Action Task Force (FATF) and similarly of that of the leading industry body the Wolfsberg Group, focusing on a chronology of its publications and contributions. Finally a more detailed examination of existing Sanctions and Embargo laws and regulations completes this Section 3.

Section 4 offers suggestions on how to manage and mitigate money laundering risks, with details about **Risk Assessment and AML Programme** design and frameworks for each of money laundering, sanctions compliance, anti-bribery and corruption, and anti-fraud Programmes.

Part 2

Section 5 provides an insight into more than **250** of the most powerful **criminal gangs** and the most dangerous **terrorist groups** operating still today and some of histories most notorious, are profiled. In doing so, it demonstrates the continued prevalence of these groups their menace and it also demonstrates that few areas of the world have escaped the insidious attentions of these parasitical and determined criminal organisations. All **Regions** of the world are included, focussing on some **Key Countries** in these regions, with increased risks and where these organised criminal gangs and or terrorists call home. The gangs and groups include mafia type organisations, street gangs, prison gangs and other gangs that are involved in substantial collective criminality and terrorist organisations, religious, political and ethnic.

Section 6 continues with a focus on Terrorists with a chronology and short summary of the **Worlds Worst Terrorist attacks** over the last 100 Years by the number of fatalities which is also followed by the **Worlds Worst Terrorist Attacks on Airlines** amounting to up to more than **150** major incidents.

Section 7 continues the focus on serious crime, the financial rewards and the laundering of the proceeds of crime by looking at more than **150** of the most renowned **Criminal Cases**, covering all manner of crimes, including corruption, drug trafficking, fraud, insider dealing and market manipulation and robbery, and many more. Whilst these cases can be seen as often exceptional, they nevertheless have to a large extent driven the legislative and public policy agenda in response to the concerns raised once these cases have come to public attention.

Section 8 completes the case theme, this time focussing

on more than **75** Financial Institution **Enforcement Cases**. FIs have been publicly sanctioned and/or fined for money laundering and or sanctions compliance related failings and these are summarised in order to illuminate the pitfalls and the increasing expectations placed on financial institutions.

Final Remarks

The contents of this Book are a work in progress as it has not been possible to include everything of interest and because new revelations will bring to light new areas of concern new areas of vulnerabilities and new areas to focus on. For now it is essential that the current areas of concern highlighted in this Book are considered and where appropriate addressed by all those keen on managing and mitigating money laundering risks.

Note to Reader

Where text is underlined it indicates a more detailed summary or profile can be found in this book, usually identifying a major risk category, instrument of law, an organised criminal gang, terrorist organisation, attack, criminal case or enforcement case.

Further Information

For more information go to www.redalert.org.uk.

Red Alert Test

For readers interested in assessing their financial crime knowledge and testing themselves against the contents of this Book, a multiple choice test is available with approximately 250 tailored questions in aggregate but individual tests covering a number of themes; including: Bribery & Corruption; Organised Crime/Drug Trafficking; Other Crimes; Terrorism Finance; WMD Proliferation Finance; Fraud; Market Abuse; Sanctions; Customer Risks; Products & Services Risks; and Money Laundering Prevention Programmes. For details about how to take the test and receive a Red Alert Certificate of Achievement for one or more modules or for the entire Test, contact the author directly on jpcusack78@gmail.com.

Note on support to the National Autistic Society

From any profits generated from the commercial sale of this Book, a contribution will be made to The National Autistic Society (www.autism.org.uk)

Five Recommendations to "Effectively" combat Money Laundering

Fighting crime has always been tough, increasingly so in a globalised world. In spite of law enforcement efforts, the age-old maxim “crime doesn’t pay” seemingly no longer applies as money laundering¹ continues to hit the headlines and ever greater estimates of criminal proceeds are announced.

According to the UN it estimated that for 2009 Global Criminal Proceeds may amount to US\$2.1 trillion,² (3.6% Global GDP) a figure which exceeds recent figures on illicit trade values of US\$1.79 trillion³ for the amount of black market crime, which is mostly made up from the proceeds from illegal drugs (approx US\$411bio), no longer the largest amount as now surpassed by proceeds from counterfeiting and piracy -- prescription drugs, food, clothing, shoes, luxury brands, movies, music, electronics, machine parts and currency (US\$691.5bio), by human trafficking, -- slavery, prostitution, economic migration, child exploitation (US\$240bio), and smuggling -- oil and gas, alcohol, tobacco and weapons (US\$162bio), and by illegal gambling -- illegal casinos and card clubs (approx US\$140bio).

These figures could even underestimate the problem, if you also add in Corruption and Fraud. The World Bank has estimated the amount of bribes paid at between US\$1 trillion to US\$1.6 trillion for example.⁴ Whilst there appear few reliable estimates for Fraud, it is clear that significant sums are lost, perhaps as much as US\$2.75 trillion, if you apply available estimates for both the UK⁵ and the US⁶ to other countries. These figures provide a stark reminder of the dangers to societies of 21st Century Crime

Organised and able to operate effectively across borders, criminals pursue these activities because they generate huge profits. They target markets where demand is strong and wealth is greatest. This means focusing on consumers in countries generating the most economic activity.

Whatever the true numbers, they are large and require a formidable response. It is axiomatic that governments need to design and implement effective measures to reduce both supply of criminal activities and demand for the products and services derived from such activities. However, governments have not succeeded in rolling back global criminal enterprises or successfully addressing the amounts laundered. According to the UN that estimated Global Criminal Proceeds of US\$2.1 trillion, in 2009 they also estimated that money flows laundered was estimated at US\$1.6 trillion and that money flows related to transnational organised crime was estimated at US\$870bio of which US\$550bio was available for laundering through the financial system. Approximately only US\$3.1bio or 0.2% of this amount is being seized.⁷ According to US Senator Carl Levin, as far back as 1999, “estimates are that US\$500bio - US\$1 trillion” are moved internationally “and that half of that money comes to the US”.⁸

On the supply side, much has been tried but little has proven to be sufficiently effective. Numerous individual successes can be claimed, but once an organisation is broken, or a leader imprisoned, another quickly takes their place. Precious little has been done to address the demand side of the problem. In response to the challenges faced by conventional law enforcement efforts aimed at limiting supply and apprehending criminals engaged in criminal activity, attention has shifted to identifying, tracing and seizing the proceeds of crime as they make their way through the illicit economy to the legal one. “Follow the money” is a common term today, but several decades ago

phrase and practice was a novel one born out of the difficulty governments were having in tackling criminal enterprises by focusing solely on their criminal acts. This fight against money laundering -- or anti-money laundering (AML) -- necessarily focuses on the financial system and the legitimate financial institutions that operate it.

The first war against drugs.

The history of combating drug trafficking is an instructive case study for the advent of AML. A hundred years ago, at the US’ behest, the great trading nations of the world came together, and finally agreed to criminalise the production and distribution of opium. The trade in opium had generated huge profits for trading companies and for States through taxation (none more than for the British Empire). However, the increasing addiction rates of populations, the deleterious effect on productivity, and the immorality of this enterprise led to the signing of the Hague Convention in 1912,⁹ hailed as a remarkable breakthrough when it came into force as part of the Treaty of Versailles in 1919 at the end of the First World War. The focus on supply-side prohibition of opium after significant insatiable demand had been established would be a policy response repeated when other drugs, like cannabis, amphetamines and cocaine, were made illegal.¹⁰

Notwithstanding the repugnance of the drug trade and the good intentions behind delegitimizing it, the net effect of withdrawing supplies of opium to millions of addicts was the creation of a massive illegal market, with huge profits to be made by producers and traders who were prepared to provide illicit supply. This should not have been a surprise, as this very outcome was predicted by British Prime Minister William Gladstone (who liked to take a drop of opium in tea often before giving a speech) in an earlier self-serving defence of the British government’s support for its own Empire’s addiction to taxes levied on the opium trade when he said “[Opium] prohibition would unleash organised crime, allow others to step in and further the insatiable demand for [drugs].”¹¹

The organised crime syndicates that followed have prospered and become transnational, controlling illegal drug production, transit and distribution. The last 100 years have seen illicit drug supply increase and expand in terms of substances (from opiates to narcotics and so-called psychotropic substances), size, and geographical scope. The organised transnational and local criminal enterprises that operate the drug trade also have expanded into new areas of illicit activity, cited above.¹¹

Advent of AML

To respond to the burgeoning narcotics trade, more than 25 years ago, the “follow the money” idea was conceived and embraced by governments of all shades, leading in 1988, to the Vienna Convention¹² that required “all members to adopt all necessary measures to enable confiscation of criminal proceeds from illegal drugs.” One year later, the Financial Action Task Force (“FATF”) was established by the then G7 group of nations to promote global standards on money laundering prevention. FATF has since extended its focus from drug trafficking to corruption, terrorism financing, WMD Proliferation Finance and other major crimes, that, also now include tax crimes. The idea is a simple one: focus on the money flows, the working capital, and the profit from serious crimes, in order to catch the criminals, to materially disrupt their criminal activities, and to create effective disincentives that will reduce serious crime.

Focusing on the financial proceeds of crime, as opposed to the underlying criminal activity, required fresh thinking, new methodologies and new players. FATF recognised the necessity of novel laws and regulations, as well as unprecedented co-operation among sovereign countries, their numerous law enforcement bodies and the financial services industry. Enlisting the financial sector was critical because it was assumed that criminals used banks and other financial intermediaries extensively – first introducing criminal proceeds into the sector (placement), then moving these funds to disguise their illegitimate origin (layering) and finally laundering their funds to obscure their illicit origin (integration).¹³ It was presumed that banks, exercising reasonable diligence, would be uniquely able to spot criminals and their financial activity. To help accomplish this, laws were passed requiring banks and others to introduce money laundering prevention programmes based on (i) knowing their customers -- identification and due diligence – (ii) monitoring of transactions to detect suspected criminal activity, and (iii) reporting such activity to government agencies that would launch investigations, prosecutions and seize financial assets.

According to criminologists, a rational person will only commit a crime if he believes the benefits outweigh the costs. In other words, to effectively deter criminal activity the probability of apprehension and conviction times the projected severity of punishment (including forfeiture of gains) must exceed the expected rewards. The hope behind AML efforts was that banks and others could provide enough information to law enforcement authorities who would follow up with successful prosecutions and asset seizures that would check the growth of, and potentially reduce, serious crime.

The first 25 years

Contrary to the perception in some quarters that financial institutions have not done much to prevent criminal enterprises from abusing their services, banks have made significant contributions, perhaps as much as US\$18bio¹⁴ both in terms of the billions of US\$ they have spent and the effectiveness of their actions. All reputable financial institutions, recognise they have an important role to play in combating money laundering, and they support the general strategy charted by governments.

Banks have worked tirelessly with governmental authorities, and international and national standard-setters, to establish and invest in programmes as new threats emerge and priorities change from drug trafficking and organised crime (where measures have increased the risks of detection and the costs of criminal activity) to corruption committed by so-called kleptocrats, who have found their access to the formal financial sector certainly impeded. Extensive efforts have been dedicated to combating terrorism finance and WMD proliferation finance, where automated systems and detailed knowledge of customers and transactions can provide crucial information quickly in response to governmental requests. With respect to the introduction of smart economic sanctions and embargo measures, the involvement of financial institutions has been critical to isolating rogue states and individuals from the formal financial sector. At the same time, the amount of information, in the form of Suspicious Activity Reports (SARs), filed by Banks and others in the industry has risen, year on year, to a level approaching 2 million individual reports a year.¹⁵

These are impressive results and the result of investments made in designing and implementing serious programmes to support the authorities in the fight against money laundering, corruption, terror finance, WMD proliferation finance, sanctions compliance and other serious crimes.

It would be incorrect and unfair to use enforcement proceedings against individual banks to detract from the overall performance and contributions made by the financial industry.

From 1989 to end-2013 financial penalties incurred by financial institutions for failure to comply with money laundering related laws, regulations or expectations, including for sanctions, violations, market abuse and fraud have topped US\$23.45bio, with more than half coming in the last 5 years.¹⁶

Without excusing some serious cases at Financial

institutions, it is predominantly weaknesses in implementing and complying with complex AML regulations that is the main issue and not aiding and abetting criminal activity. It is the criminals that should remain central to our concerns. Beyond gains achieved in the areas of terror finance, WMD proliferation finance, and Sanctions Compliance, the substantial efforts of banks have not resulted in the expected gains by others.

According to the “follow the money” strategy, information provided to governmental authorities by the banks and others should lead to prosecutions and asset seizures. With almost 2 million Suspicious Activity Reports (SARs) filed annually, there is no shortage of information. Nevertheless, despite these opportunities, asset seizure and forfeiture rates remain significantly below any form of tipping point. Whilst consistent figures are scarce albeit thankfully climbing in many countries (albeit flattered by forfeiture levies on financial institutions) so is the haul by criminals of the proceeds of crime.

According to the UN based on all available estimates, less than 1% of the total amounts that are being laundered are detected. The UN report issued in 2011¹⁷ found and reported that, “Data collected by the US State Dept suggest that some US\$3.1bio were seized in connection with money laundering activities in 32 countries out of 62 analysed (2010 or latest data available); more than 80% of this was seized in North America. This would be equivalent to some 0.2% of the best estimate of the extent of money laundering at the global level. In comparison, more than 20% of the globally produced opiates are being seized and more than 40% of cocaine.”

Other figures indicate the seizure rates, particular over the last few years are actually much higher than those reported in the UN study, particularly in the US¹⁸ but also elsewhere¹⁹ though recent increases are not as large. There is evidence however that increases are being made by the targeting of big ticket corporate fraud and bank enforcement cases which are overshadowing recoveries from the original targets being serious and Organised crime, particularly in the US. In Europe the picture is mixed. Whilst there is relatively little seized and forfeited in many European Countries a recent €1.6bio success against the Italian Mafia, by the Italian authorities is cause for optimism.²⁰

Despite some success it appears that few of these directly relate in some way due to the filings from SARs or at least there is little or no evidence to suggest that this is the case, or that the majority of the seized assets are in

the form of banked assets. For example, it is likely that most of all seizures are in the form of physical assets, such as real estate, businesses and cash, or from financial institutions’ forfeiture fines.

In sum, although the situation would have been worse without the last 25 years of anti-money laundering efforts and certain costs have been imposed on offenders, the cost-benefit calculus would appear to still tip decisively in favour of the criminal. Criminals enjoy not only a tax free income, but can expect to retain almost all of their illicit bounty. With large new markets to exploit, both geographic and industrial, the benefits to criminals in committing crime for profit remain compelling and growing.

The next 25 years

In response to the current situation, authorities have called for more of the same. In 2010, UNODC Head Antonio Mario de Costa reiterated his support for this strategy with the words,²¹ “Criminals are motivated by profit, so let’s go after their money,” and in 2012 FATF announced revised recommendations²² extending the “follow the money” approach, essentially increasing the ask on banks for the future even further. But there is no reason to believe that this will lead to materially improved results. Indeed, extension and intensification of the existing strategy may compound difficulties and make the effort, less efficient and no more effective than today.

What can be done is a genuine evaluation of “effectiveness”. FATF have indeed recognised this and deserve praise for not only making compliance with FATF standards an important part of the next round of Mutual Country Evaluations but also by including effectiveness as a core element that will also be evaluated, this should enable FATF, its sponsors and members, to critically assess the effectiveness²³ of the “follow the money” strategy and develop recommendations for action.

In the US, new FINCEN Director, Ms Shasky Calvery who until 2010 held the position of Chief of the Asset Forfeiture & Money Laundering Section of the US Department of Justice has begun to ask the difficult questions. In a speech to the American Bankers Association/American Bar Association, Ms Calvery acknowledged that institutions are spending a great deal of time and money on compliance programmes, however, she raised questions whether the money being spent is being spent in the right ways. “Industry and others often ask questions such as how does industry effort on compliance risk compare with illicit financing risks and what is the delta between them.” These are

questions that need to be answered by regulators, law enforcement and industry” in order to answer these questions a “Delta Team” has been established.²⁴

Where FATF and the US are already leading others should follow by ensuring effectiveness is a key theme for 2013 and beyond, reaching out to all stakeholders including financial institutions, establishing their own “Delta Teams” and considering the following 5 Recommendations to effectively combat Money Laundering as part of their work.

5 Recommendations to Effectively Combat Money Laundering

Five Recommendations to “Effectively” combat Money Laundering	
1	Set and reach a target for asset seizures (for example, 5% or US\$100bio in 5 years): Focus urgently on implementing all necessary measures to remove obstacles.
2	New Regulations should apply fully also to non-banks, and ensure international consistency on critical areas, e.g., CID, PEPs, BOs, DNFBPs, Wires; and be subject to a cost benefit analysis
3	Information on Risks and Threats must be shared and communicated: National Threat Assessments published and tailored for use by FIs, predicate priorities identified, typologies and strategies communicated.
4	Encourage financial institutions (who must improve cultures of compliance) enhance risk based approaches and provide incentives
5	Educate Consumers targeting demand as well as supply to refrain from supporting criminal actors in purchasing decisions and in understanding the money laundering broader context

Recommendation 1

Asset Seizure Targets - Firm asset seizure targets could be set with regards to the proceeds of crime. At least 5% of criminal proceeds, approx US\$100bio should be the medium term goal (e.g. after 5 years). In order to achieve this, enforcement authorities will need to invest additional resources to investigate the information provided from reports already filed by financial institutions that should be a road map for prosecuting many more criminals and seizing criminal assets. As a start, public resources directly employed to these tasks should match at least those invested by the private sector and results should be published.

A detailed study of the problems faced and the impediments to success and recommendations to improve

asset seizure and forfeiture the system was conducted by Matrix Insight and released in July 2009, following a request by the European Commission.²⁵ These recommendations should be acted upon.

FATF's 2012 Best Practices on Confiscation and a Framework for Ongoing Work or Asset Recovery²⁶ and the EU's proposed Directive on freezing and confiscation of the proceeds of crime²⁷ are a start but by themselves will make little impact and will not address the problem.

Recommendation 2

Regulations should ensure consistency and subject to Cost Benefit analysis - The introduction of new Regulations concerning AML largely falls upon financial institutions, and within FIs on Banks. Non-Bank FIs²⁸ and non-FIs²⁹ identified as presenting real risks should accept greater responsibility and increase their contributions to match those of the Banks. The Banks should not be expected to provide assurance where regulation is required on third parties.

New regulations are targeted at perceived gaps or perceived risk areas in the money laundering frameworks rather than on any assessment or threshold test, for example a cost benefit or effectiveness test before introduction. In many cases it is unclear whether proposed changes will have any material affect on the underlying levels of crime or criminal proceeds and yet the costs of introduction and compliance are largely ignored.

Regulations are also introduced across jurisdictions often inconsistently. The complexity of trying to comply with international best practices and at the same time national regulations can create confusion, drive up unnecessarily compliance costs and raise complexity. Financial institutions operating globally should be entitled to rely on internationally accepted standards, recognising that such standards may have an element of gold plating.

For core issues, such as, without limitation, (i) the definition of "Customer" (ii) the definition of "beneficial ownership" and definitions such as (iii) PEPs, (iv) wire transfer standards and (v) agreement over types of and approaches towards non-FIs that should be regulated designated entities, these should be universally consistent.

Recommendation 3

Information on Risks and Threats must be shared and communicated - It has become a cliché that flow of information sharing should not be a one-way

street; governments should share information with financial institutions. However, after years of lip service, governmental authorities have made little progress. If governments want to promote successful collaboration to combat financial crime and achieve more impressive results, they must entrust financial institutions with more information. A robust National Risk and Threat Assessment identifying and prioritising risks and threats honestly is essential as well as identifying where FIs can and should provide assistance. Furthermore, financial institutions should be able to maintain appropriate records, share certain information amongst themselves and across borders, without any conflict with applicable data protection or other laws or regulations. This need not include any individual SAR filing made in another country, though the underlying case facts and details should be included.

Additionally, clear priorities should be set and announced as to the relative importance and targets of effort.

All agree that actions to be taken are inevitably risk-based, i.e. the areas that present the greatest risk should receive the greatest attention, this is impossible without specific information from governments on their priorities. Currently, because of this lack of information, financial institutions find themselves in a difficult situation and regulators seem unwilling to offer any guidance or safe harbours. If the government doesn't set priorities, or says that everything is a priority - which amounts to the same thing - then financial institutions cannot accurately assess their risks or concentrate their compliance efforts on those areas that pose the greatest risk, and regulators cannot focus their examination and enforcement efforts on those areas either.

If priorities are set and clearly communicated then banks can and will translate the government's priorities into compliance systems across their mix of products and services, assessing the risks that their various business lines present and designing compliance systems that address those risks.

At the same time, regulators will design examination and enforcement protocols designed to ensure that banks have in place procedures that will adequately identify and control the risks associated with money laundering and terrorist financing. But in order to have a risk-based system, banks must know which crimes or similar activities should be given the highest attention and how regulators will approach Banks judgements in this respect. Absent this information, the result is likely to be in many cases unfocused compliance that tries to catch everything and winds up missing too much of the

things that are most important.

Based on harms and threats it would appear reasonable to assume that terrorism finance and WMD proliferation finance are indeed major priorities for many governments, though again, these should be expressly confirmed and remaining priorities enunciated. Based on the amounts of criminal monies derived, there is a case for considering that Counterfeiting and Piracy should increase in priority. Other priorities for inclusion will likely include, Corruption (kleptocracy); Fraud (specific elements, for example VAT Tax Fraud, Cybercrime); Illegal Gambling; Drug Trafficking; Human Trafficking and Smuggling which together make up to 95% of likely criminal proceeds.³⁰

For each, tailored strategies should be developed and the existing one size fits all, with excessive reliance on financial institutions, KYC, Monitoring and SAR filing should be reconsidered.

Recommendation 4

Encourage Financial Institutions – financial institutions must focus on preventing and detecting criminal proceeds, as well as implementing applicable AML Laws and Regulations and ensuring an institutional "culture of compliance" exists which emphasises the important role banks play in maintaining the integrity of the international financial system, national security and corporate social responsibility.

Financial institutions should be encouraged to adopt a "risk based approach", in their design and implementation of AML programmes and should not be second guessed provided such programmes are reasonable and proportionate and ultimately reasonably effective, particularly absent published regulatory specificity.

Contributions by financial institutions should be recognised and where appropriate taken into account when assessing an institution's record particularly before imposing fines and penalties. Banks should be encouraged to treat AML compliance costs differently than regular business expenses (e.g., facilities costs) and more like important capital investments that promote profitability and critical public goods.

Banks that routinely dedicate resources to efficient and effective compliance should be given direct economic benefits – reduction of examination fees and other supervisory assessments, consideration in calculating capital, or tax advantages.

Recommendation 5

Educate Consumers - Someone must educate the public about the true cost of money laundering and how money laundering plays a fundamental role in facilitating the drug trafficker, the organised criminal, the fraudster and the terrorist. Money laundering is not a victimless crime. Whilst it does not have the trauma of a robbery or produce the damage resulting from violent crime, money laundering can only take place after a predicate crime (such as robbery or drug dealing) has taken place. Reinforcing the clear link may also persuade and incentivise otherwise law abiding citizens of the consequences of paying for counterfeit or smuggled goods, use of economic migrants as cheap labour, prostitution, drug taking or involvement in illegal gambling. The economics of crime are no different from the economics of trade and reducing demand will have just as much an impact as disrupting supply.

Conclusions and Final Remarks

Financial institutions operate on the front line on the right side of a just war on the proceeds of crime, on a battlefield that is constantly changing, against an enemy who remains cunning, elusive and very well resourced, without being provided with much useful intelligence and in constant concern over the risk of friendly fire. This is no way to win a war!

The battle is not yet lost and we have plenty of fight left in us, so let us join once more to address the weaknesses in the strategy and to try to work ever more closely together as banks, regulators, policy makers, law enforcement and governments focusing on the common enemy, criminals and proceeds of their crimes.

Facts & Figures

most Kidnapping for Hostage annually - Mexico
18,000

What is Money Laundering?

Introduction

Whilst the term “money laundering” was invented and used for the first time only in the 20th Century, money laundering as a practice goes back much further, for example, as long ago as 4000 BC, Chinese merchants found ways of moving their money around in order to avoid identification and confiscation by the rulers of the Chinese State.

Activities that are now predicate crimes, go back as far, as opium usage would have been practiced around this time too and also later in 640 BC coins were counterfeited by clipping alloys and using the shavings to make new coins, the case of Hegestratos’ Fraud in 300 BC,¹ Roman laws addressing forgery enacted around 80 BC, and slavery, terrorism, murder, smuggling and theft of course not at all uncommon throughout antiquity.

What is the origin and true meaning of the term “Money Laundering”?

Fast forward to the Twentieth Century, the term “money laundering” is often said to have originated during “Prohibition” and from the activities of US gangsters, who needed to find ways to disguise the origins of the large amounts of cash, often in small denominated coins, generated by the illegal import and sale of alcohol and other activities such as gambling and prostitution.

With the Banks’ likely suspicious if large amounts of coins were deposited and the storage of large amounts of money in low value coins a challenge they created businesses, one of which was slot machines, and another of which was laundromats, which of course took coins to operate the machines, and so could pass off the proceeds of crime as proceeds from legitimate businesses. So it is thought by some that the term “money laundering” was born.

One of the first modern examples of money laundering followed the conviction of America’s most wanted at the time, Al Capone. It was the conviction for tax evasion that seems to have led to others fearing the same fate, paying closer attention to the financial side of their criminal businesses and establishing money laundering operations that would protect them and make any prosecution much more difficult. Meyer Lansky a cohort of Al Capone and known as the mob’s accountant, came up with a scheme that would be copied by many in later years. Lansky not only established offshore accounts with foreign banks, away from the gaze of US

prosecutors, but he also borrowed from these Banks, receiving what looked like legitimate loans, backed by the deposited criminal monies. These loans could even be disclosed to the revenue service and a tax deduction declared if necessary. Even so this scheme and others, were not described using the term, “money laundering.”

Whilst some commentators reject this historical origin for the term, whilst accepting coin operated laundromats may have been used amongst other retail and cash intensive businesses, they prefer a descriptive genesis for the term. For example, Jeffrey Robinson in his 1995 “The Laundrymen” where he considered money laundering mainly the proceeds of drug trafficking was the third largest industry in the world behind foreign exchange and oil and gas, (this is clearly an overstatement, see below), he also alleged that much of the laundered money was reinvested throughout the world by otherwise legitimate businessmen, lawyers, accountants and bankers, describing why it is called as it is, as follows:

“Money laundering is called what it is because that perfectly describes what takes place - illegal, or dirty, money is put through a cycle of transactions, or washed, so that it comes out the other end as legal, or clean, money. In other words, the source of illegally obtained funds is obscured through a succession of transfers and deals in order that those same funds can eventually be made to appear as legitimate income”.²

.....Jeffrey Robinson, “The Laundrymen”

Whilst the arguments over the origin of the term will continue, money laundering as a term of expression appears to have been used first, at least as far as we can tell from records available, as part of the reporting of the Watergate scandal in the early 1970s.

Investigating, the burglary of the Democratic National Committee Headquarters in Washington’s Watergate building on 17 June, 1972, Washington Post reporters, Bob Woodward and Carl Bernstein, chronicled in All the President’s Men, broke the story that led to the resignation of then US President Richard Nixon.

The reporters learned that investigations carried out by Miami Dade County chief investigator Martin Dadis uncovered a cashier’s cheque for US\$25,000 deposited into a Boca Raton bank account of one of the burglars, Bernard Barker. Dadis had subpoenaed the Boca Raton bank records upon learning that Barker was carrying more than US\$5,000 in new, consecutively numbered US\$100 bills when he was arrested. Dadis followed the new bills back to the Boca Raton bank and uncovered the US\$25,000 cheque payable to Ken Dahlberg deposited in Barker’s account. The reporters pursued

the Dahlberg connection and learned Dahlberg was the Republican’s Midwest finance chairman of Nixon’s 1972 re-election campaign. Dahlberg had collected US\$25,000 in cash from a Nixon re-election donor who wished to remain anonymous in order to avoid disclosing the contribution under the new campaign financing laws.

Dahlberg converted the cash into a cashier’s cheque payable to himself and gave the cheque to Maurice Stans, finance chairman for the Nixon campaign. Dardis explained that the new campaign finance law that came into effect on April 7 1972 had triggered a massive effort by Stans to solicit re-election contributions from donors. Stans would tell reluctant donors that if they didn’t want their contributions traced back to them, their anonymity could be ensured by moving their contributions through Mexican banks because Mexico does not allow the US to subpoena bank records. Dardis explained, “It’s called laundering. You set up a money chain that makes it impossible to trace the source. The mafia does it all the time. So does Nixon...This guy Stans set up the whole thing.”³

This system allowed Nixon’s re-election campaign to receive illegal contributions from corporations, and other impermissible or illicit donor groups. Stans used Banco Internacional in Mexico City for the scheme and it was Banco Internacional that issued the US\$25,000 Dahlberg cashier cheque.

As a result an article appeared in the Washington Post on 1 August 1972 headlined: “Bug Suspect Got Campaign Funds”. The story immediately triggered three separate investigations and helped seal Nixon’s fate. As one Post reporter commented: “It [the cheque] was the first real connective glue between Watergate, its funding and the Nixon campaign.”⁴

The expression first appeared in a formal context, in a US court in 1982 in the case US v US\$4,255,625.39 (1982) 551 F Supp.314. This matter involved a forfeiture case, where it was decided that over US\$4mio in cash currency plus the balance on a bank account in Miami of more than US\$3.6mio could be seized, as a “substantial connection” between the money and narcotics transactions was made. The court in its judgement mentioned the fact that, “Miami has become a centre for drug-smuggling and money laundering.”⁵

Money laundering was first criminalised in the US in 1986 with the passing of the Money Laundering Control Act. In the 1986 Act Money Laundering was described as:

“between money laundering and organised crime. Congress’s primary intent was to criminalise the, ‘process by which one conceals the existence, illegal source, or illegal application of income, and then disguises that income to make it appear legitimate.”

.....US Money Laundering Control Act 1986⁶

In 1988 in the UN Convention against illicit traffic in narcotics and psychotropic substances, also known as the Vienna Convention was the first international instrument which included in its purposes criminal asset forfeiture in order to combat serious crime and Money Laundering was defined as:

“the conversion or transfer of property, knowing that such property is derived from any (drug trafficking) offense or offenses, for the purpose of concealing or disguising the illicit origin of the property or of assisting any person who is involved in the commission of such an offense or offenses to evade the legal consequences of his actions; the concealment or disguise of the true nature, source, location, disposition, movement, rights with respect to, or ownership of property, knowing that such property is derived from an offense or offenses or from an act of participation in such an offense or offenses; the acquisition, possession or use of property, knowing at the time of receipt that such property was derived from an offense or offenses..or from an act of participation in such offense or offences.”

.....UN Vienna Convention 1988⁷

In 1999 the UN in its International Convention for the Suppression of the Financing of Terrorism defined “terrorism financing” as follows:

“Any person commits an offence within the meaning of this Convention if that person by any means, directly or indirectly, unlawfully and wilfully, provides or collects funds with the intention that they should be used or in the knowledge that they are to be used, in full or in part, in order to carry out” (a) An act which constitutes an offence within the scope of and as defined in one of the following treaties: Convention for the Suppression of Unlawful Seizure of Aircraft, done at The Hague on 16 December 1970.”

.....United Nations 1999 International Convention for the Suppression of the Financing of Terrorism⁸

The money laundering definition used in the Vienna Convention remains current and are referenced as the standard by FATF in its 2012, 40 Recommendations, where it states

“FATF incorporate the Vienna Conventions technical and legal definition of Money Laundering and recommends ex-

panding the predicate offences to include all serious crimes.” It also states the following in the 40 Recommendations in 2012 referring money laundering to

“The processing of...criminal proceeds to disguise their illegal origin in order to legitimise the ill-gotten gains of crime.”⁹

FATF also include a definition of Terrorist financing which is:

“Terrorist financing is the financing of terrorist acts, and of terrorists and terrorist organisations.”

.....FATF 2012, 40 Recommendations⁹

Other Definitions or Descriptions of Money Laundering / Terror Financing

The following are a selection of definitions and descriptions of “money laundering” and “terror finance” from all over the world:

“the conversion or transfer of property, knowing that such property is derived from serious crime, for the purpose of concealing or disguising the illicit origin of the property or of assisting any person who is involved in committing such an offence or offences to evade the legal consequences of his action, and the concealment or disguise of the true nature, source, location, disposition, movement, rights with respect to, or ownership of property, knowing that such property is derived from serious crime.”

.....Article 1 EU First Money Laundering Directive 1991¹⁰

“Money Laundering is the process by which criminal proceeds are sanitised to disguise their illicit origins. Acquisitive criminals will attempt to distance themselves from their crimes by finding safe havens for their profits where they can avoid confiscation orders, and where those proceeds can be made to appear legitimate. Money laundering schemes can be very simple or highly sophisticated. Most sophisticated money laundering schemes involve three stages: Placement - the process of getting criminal money into the financial system; Layering - the process of moving money in the financial system through complex webs of transactions, often via offshore companies; Integration - the process by which criminal money ultimately becomes absorbed into the economy, such as through investment in real estate. Prosecutions for money laundering can involve any of these stages in the money laundering process.”

.....UK Proceeds of Crime 1992 Preamble¹¹

“The basic characteristics of the laundering of the proceeds of crime, which to a large extent also mark the operations of organised and transnational crime, are its global nature,

the flexibility and adaptability of its operations, the use of the latest technological means and professional assistance, the ingenuity of its operators and the vast resources at their disposal.”¹²

.....UN report 1993¹²

“Money laundering is the process of making illegally-gained proceeds (i.e. “dirty money”) appear legal (i.e. “clean”).

Typically, it involves three steps: placement, layering and integration. First, the illegitimate funds are furtively introduced into the legitimate financial system. Then, the money is moved around to create confusion, sometimes by wiring or transferring through numerous accounts. Finally, it is integrated into the financial system through additional transactions until the “dirty money” appears “clean.” Money laundering can facilitate crimes such as drug trafficking and terrorism, and can adversely impact the global economy.”

.....FinCEN¹³

“Money Laundering is broadly interpreted as feeding the proceeds of crime or corruption into the financial system in order to give it the appearance of proceeds of legitimate activity, and the financing of illegal activities including terrorism through financial systems.”

.....UBS Global AML Policy since 2004¹⁴

“... (i) the conversion or transfer of property derived from criminal activity to conceal or disguise its illicit origin; (ii) the concealment or disguise of the true nature, source, location, disposition, movement or ownership of property known to have been derived from criminal activity; (iii) the acquisition, possession or use of property known to have been derived from criminal activity; (iv) the participation, or assistance, in the commission of any of the activities above.”

and.... “terrorist financing” means the

“provision or collection of funds to carry out any of the offences defined in Council Framework Decision 2002/475/JHA on combating terrorism, such as hostage taking, the drawing-up of false administrative documents and the leadership of a terrorist group.”

.....EU Third Money Laundering Directive 2005¹⁵

“Money laundering is the conversion of the proceeds of criminal activity into apparently clean funds, usually via the financial system. This is done by disguising the sources of the money, changing its form, or moving the funds to a place where they are less likely to attract attention. “Criminal activity” includes fraud, corruption, drug dealing and other serious crimes.”

.....EU press Release 2012¹⁶

“Money laundering is the attempt to conceal or disguise the nature, location, source, ownership, or control of money.”

.....MoneyGram¹⁷

“Money laundering is the covert introduction of illegally acquired assets into the legitimate economy with the aim of disguising their true illegal origin.”

.....Swiss Bankers Association¹⁸

“Legitimisation (washing) of illegally obtained money to hide its true nature or source (typically the drug trade or terrorist activities). Money laundering is effected by passing it surreptitiously through legitimate business channels by means of bank deposits, investments, or transfers from one place (or person) to another.”

.....BusinessDictionary.com¹⁹

“money laundering is any act or attempted act to conceal or disguise the identity of illegally obtained proceeds so that they appear to have originated from legitimate sources.”

.....Interpol²⁰

“Disguising the source of money generated through illegal activities so that it resembles legitimate income. Money laundering involves breaking up large amounts of cash into smaller transactions, changing its form through investments or deposits into bank accounts, and moving the money through seemingly legitimate businesses to bring it into mainstream economy.”

.....Nasdaq²¹

“Money laundering is generally defined as engaging in acts designed to conceal or disguise the true origins of criminally derived proceeds so that the proceeds appear to have derived from legitimate origins or constitute legitimate assets.”

and

“Terrorist financing may not involve the proceeds of criminal conduct, but rather an attempt to conceal either the origin of the funds or their intended use, which could be for criminal purposes. Legitimate sources of funds are a key difference between terrorist financiers and traditional criminal organisations....Funding for terrorist attacks does not always require large sums of money and the associated transactions may not be complex.”

.....FINRA²²

“The attempt to conceal or disguise the ownership or source of the proceeds of criminal activity and to integrate them into the legitimate financial systems in such a way that they cannot be distinguished from assets acquired by legitimate means. Typically this involves the conversion of cash-based proceeds into account-based forms of money.”

.....OECD²³

“Money laundering is the name given to the process by which illegally obtained funds are given the appearance of having been legitimately obtained.”

.....Austrac²⁴

“Money Laundering is the process by which proceeds from a criminal activity are disguised to conceal their illicit origins...involving the proceeds of criminally derived property rather than the property itself.....and Financing of terrorism is the financial support in any form of terrorism or of those who encourage, plan, or engage in it.”

.....The World Bank²⁵

“Terrorist financing refers to the processing of funds to sponsor or facilitate terrorist activity. A terrorist group, like any other criminal organisation, builds and maintains an infrastructure to facilitate the development of sources of funding, to channel those funds to the providers of materials and/or services to the organisation, and, possibly, to launder the funds used in financing the terrorist activity or resulting from that same activity. Terrorist organisations derive income from a variety of sources, often combining both lawful and unlawful funding, and where the agents involved do not always know the illegitimate end of that income. The forms of financing can be grouped in two types: Financial support – In the form of donations, community solicitation and other fundraising initiatives. Financial support may come from states and large organisations, or from individuals. Revenue generating activities - Income is often derived from criminal activities such as kidnapping, extortion, smuggling or fraud. Income may also be derived from legitimate economic activities such as diamond trading or real estate investment.

The terrorist financier will want to disguise the illegal end of the funds, while trying to maximize the revenues for the organisation sponsored. It may be necessary to disguise the source of the funds, as well, either because such funds have an illegal origin, or because the organisation wants to preserve the continuity of the legitimate financing. The need to camouflage the source of the funds means that terrorist financing has certain similarities with traditional money laundering, namely the use of three stages to place, layer and integrate the funds in the international financial system.”

.....Fides²⁶

“Money Laundering is the process by which criminals attempt to conceal the true origin and ownership of the proceeds of criminal activities. If successful, the money can lose its criminal identity and appear legitimate. Illegal arms sales, smuggling, and the activities of organised crime, including for example, drug trafficking and prostitution, can generate huge sums. Embezzlement, insider trading, bribery and computer fraud schemes can also produce large profits

and create the incentive to “legitimise” the ill-gotten gains through money laundering. When a criminal activity generates substantial profits, the individual or group involved must find a way to control the funds without attracting attention to the underlying activity or the persons involved. Criminals do this by disguising the sources, changing the form, or moving the funds to a place where they are less likely to attract attention. In summary, the money launderer wants to: place his money in the financial system, without arousing suspicion; move the money around, often in a series of complex transactions crossing multiple jurisdictions, so it becomes difficult to identify its original source; and then move the money back into the financial and business system, so that it appears as legitimate funds or assets.”

..... Financial Supervision Commission Isle of Man²⁷

“Terrorist financing involves the solicitation, collection or provision of funds with the intention that they may be used to support terrorist acts or organisations. Funds may stem from both legal and illicit sources. More precisely, according to the International Convention for the Suppression of the Financing of Terrorism, a person commits the crime of financing of terrorism “if that person by any means, directly or indirectly, unlawfully and wilfully, provides or collects funds with the intention that they should be used or in the knowledge that they are to be used, in full or in part, in order to carry out” an offence within the scope of the Convention. The primary goal of individuals or entities involved in the financing of terrorism is therefore not necessarily to conceal the sources of the money but to conceal both the financing and the nature of the financed activity.”

..... IMF²⁸

“The process of creating the appearance that large amounts of money obtained from serious crimes, such as drug trafficking or terrorist activity, originated from a legitimate source.”

..... Investopedia²⁹

And many more.....

What are the stages of “Money Laundering”?

So much for the origin of the term “Money laundering” but what is it? According to FATF, money laundering is made up of the following 3 stages;³⁰ placement, layering and integration

Placement

In the initial - or placement - stage of money laundering, the launderer introduces his illegal profits into the financial system. This might be done by breaking up large amounts of cash into less conspicuous smaller sums that are then deposited directly into a bank account, or by purchasing a series of monetary instruments (cheques, money orders,

etc.) that are then collected and deposited into accounts at another location.

Layering

After the funds have entered the financial system, the second – or layering – stage takes place. In this phase, the launderer engages in a series of conversions or movements of the funds to distance them from their source. The funds might be channelled through the purchase and sales of investment instruments, or the launderer might simply wire the funds through a series of accounts at various banks across the globe. This use of widely scattered accounts for laundering is especially prevalent in those jurisdictions that do not cooperate in anti-money laundering investigations. In some instances, the launderer might disguise the transfers as payments for goods or services, thus giving them a legitimate appearance.

Integration

Having successfully processed his criminal profits through the first two phases the launderer then moves them to the third stage – integration – in which the funds re-enter the legitimate economy. The launderer might choose to invest the funds into real estate, luxury assets, or business ventures.

.....FATF 2012, 40 Recommendations

This 3 stage process, the classic description of money laundering has also been described as “immersion”; generally inserting the proceeds of crime into the legitimate financial system, “heavy soaping” or disguising the trail of the monies as they pass through the financial system and finally the “spin dry” when the funds make it into legitimate income or assets.

Furthermore FATF explain where Money Laundering may occur as follows:³¹

“As money laundering is a consequence of almost all profit generating crime, it can occur practically anywhere in the world. Generally, money launderers tend to seek out countries or sectors in which there is a low risk of detection due to weak or ineffective anti-money laundering programmes. Because the objective of money laundering is to get the illegal funds back to the individual who generated them, launderers usually prefer to move funds through stable financial systems.

Money laundering activity may also be concentrated geographically according to the stage the laundered funds have reached. At the placement stage, for example, the funds are usually processed relatively close to the underlying activity; often, but not in every case, in the country where the funds originate.

With the layering phase, the launderer might choose an

offshore financial centre, a large regional business centre, or a world banking centre – any location that provides an adequate financial or business infrastructure. At this stage, the laundered funds may also only transit bank accounts at various locations where this can be done without leaving traces of their source or ultimate destination.

Finally, at the integration phase, launderers might choose to invest laundered funds in still other locations if they were generated in unstable economies or locations offering limited investment opportunities.”

For Terrorism Finance, FATF, in their 2008 Terrorism Financing Typologies Report, also highlighted 3 stages, though these were not Placement, Layering and Integration, but Raising, Moving and Using funds, both criminally originated funds, where the 3 money laundering stages would still apply, but also to legally originated funds

What is the size of “Money Laundering”?

Money Laundering may be the 10th Largest Industry in the World and one of the most profitable.

It is often quoted and considered as conventional wisdom that money laundering is the third largest industry in global terms behind foreign exchange and oil and gas. In fact, this is clearly overstating its size, with Food, Retail, Energy including Oil and Gas, Financial Services, Tourism, Manufacturing including Automobiles, Telecommunications and Pharmaceuticals/healthcare all substantially larger. Money Laundering is also likely behind also the Arms Industry, but may still just make it into the top 10 at number 10.

Top 10 Global Industries	
1	Food
2	Retail
3	Energy
4	Financial Services
5	Tourism
6	Manufacturing
7	Telecommunications
8	Healthcare
9	Arms & Defence
10	Money Laundering

Source: Author

Despite its position as perhaps the 10th largest, there is little doubt that it is one of the most profitable with

huge margins and of course all proceeds are tax free. According to the UN for 2009, out of US\$2.1 trillion in criminal proceeds, approximately US\$1.6 trillion was laundered but only US\$3.1bio was seized, giving an effective tax or clean up rate of 0.2%.³²

The figure of US\$2.1 trillion is a figure that related to classic predicate offences. These numbers ignore bribery and corruption estimated at US\$1 trillion - US\$1.6 trillion a year,³³ As predicate offences also now include insider dealing and market manipulation, fraud and tax fraud, these figures could be increased further for fraud by as much as US\$2.75 trillion³⁴ and tax fraud and tax evasion as much as US\$4.75 trillion.³⁵

Final Comments / Conclusion

As criminal activity, beyond drug trafficking become classified as predicate offences to Money Laundering, the original definitions and the classical 3 stages are unlikely to be sufficient to fully describe what money laundering is and how it is carried out, particular when considering, trade based laundering schemes, insider dealing and market manipulation, terrorism finance, tax fraud and tax evasion. Furthermore with advances in technology, electronic and mobile cash and digital currencies, we may need to consider whether money alone remains the principal concern.

Section 1 - Money Laundering Crimes

- Introduction, 21
- Bribery & Corruption
- Counterfeiting & Piracy of Products, 29
- Drug Trafficking, 35
- Environmental Crime, 42
- Extortion, 48
- Forgery, 50
- Fraud incl Tax Fraud & Cybercrime, 52
- Human Trafficking, 63
- Illicit Arms Trafficking, 66
- Insider Dealing, 69
- Kidnap, Illegal Restraint & Hostage Taking, 78
- Market Manipulation, 82
- Murder and Grievous Bodily Injury, 89
- Organised Crime, 93
- Smuggling, 100
- Terrorism Finance, 106
- Theft, Robbery & Trafficking, 118
- WMD Proliferation Finance, 123

Introduction

The crimes that are included in this Part 1, Section 1, are those that have for many years been included in FATF's list of predicate offences to Money Laundering, as well as the most recent additions which together are seen as the most serious criminal offences which need to be countered.

FATF designated categories of offences include	
1	Participation in an organised criminal group and racketeering
2	Terrorism including terrorism financing
3	Trafficking in human beings and migrant smuggling
4	Sexual exploitation including sexual exploitation of children
5	Illicit trafficking in narcotic drugs and psychotropic substances
6	Illicit arms trafficking
7	Illicit trafficking in stolen and other goods
8	Corruption and bribery
9	Fraud
10	Counterfeit and piracy of products
11	Environmental crimes
12	Murder, grievous bodily injury
13	Kidnapping, illegal restraint and hostage taking
14	Robbery or theft
15	Smuggling (including in relation to customs & excise duties and taxes)
16	Tax crimes (related to direct taxes and indirect taxes)
17	Extortion
18	Forgery
19	Piracy
20	Insider trading and market manipulation

Source: FATF 40 Recommendations 2012¹

Whilst most are crimes which have a financial gain as the motive, some may not, for example, murder and bodily harm, though in an organised crime context violence is part of the necessary tool box required to stay in business and effective, or terrorism which is politically motivated, though requires funding often generated from the proceeds of crime but in other cases

is funded from legitimately sourced funds.

Whilst all these serious crimes threaten individuals and society's health and prosperity in varying degrees, the levels of activity, the criminal profits that are generated, the numbers of persons involved in criminal acts and the degree of harm caused as a result make any relative comparison or list which prioritizes these crimes based on negative consequences extremely challenging.

Whilst aggregated statistics are scarce the following, according to Havocscope, generate the most in criminal proceeds:

Criminal Proceeds by Crime		
No	Activity	US\$ Proceeds
1	Bribery & Corruption	1-1.6 trillion
2	Organised Crime	870bio
3	Counterfeiting & Piracy	691.5bio
4	Drug Trafficking	411bio
5	Human Trafficking	240bio
6	Smuggling	162bio
7	Illegal Gambling	140bio
8	Environmental Crime	83.5bio
9	Kidnap & Ransom	1.5bio
10	Forgery	1.1bio

Source: 1 - World Bank² / 2-10 - Havocscope³

Havocscope focuses on Black Markets, and largely ignores "Fraud" which is a very broad category of offences, sometimes described as "White Collar Crime" and whilst no aggregate number is available, it could be that in total this number could exceed all other Black Market crimes.

Looking at how the International Community responds, it can be assumed that Terrorism and Terrorism Finance together with WMD Proliferation remains at the top of the list. Whilst Terrorism itself is shocking and the mayhem caused deeply disturbing for those involved, its impact beyond grabbing media headlines is limited. Nevertheless, it is where Terrorism and WMD Proliferation come together that the potential for harm on an almost unimaginable basis provides greatest concern. It is also why so-called "Rogue States" engaged in developing WMD also cause greatest concern. Whilst the traditional view of terrorism was that terrorists would seek to limit casualties so as to make an impact but not to cause an excessive damaging

response, the events of 9/11 changed that view. Though the traditional view may still hold for the majority of the major terrorist organisations, Al-Qaeda has clearly departed from that view and only the complacent would consider Al-Qaeda as either a spent force or unwilling if it had the means to use WMD.

Following Terrorism and WMD, Drug Trafficking and with it those organised criminal gangs involved would appear to be the next biggest priority, at least if judged by the amount of effort and resources still deployed and expended since the so called "War on Drugs" began in the 1970s. Whilst the War on Drugs and the focus on Organised Crime has had notable individual successes, the criminal supply lines are strong and enduring and those involved continue to grow their criminal businesses.

Next is hard to tell. Corruption receives a lot of attention, including from Policy Makers, Academics and the Media, though in practice on the ground progress is slow and Corruption remains endemic in many parts of the World and for many it is a way of life.

Smuggling and more recently Tax Fraud, where governments lose billions to criminals and to otherwise law abiding citizens in evading taxes also receives a lot of attention and appears to be an increasing real priority.

Human Trafficking has also begun to receive more attention and appears to be increasingly a priority issue.

For the rest these would appear to remain important but lack the appeal or the focus that is attached to terrorism or corruption, for example. It is interesting that according to sources, the crime that generates the most in illegal profits, counterfeit and piracy, even more than for drugs appears to have a relatively speaking low priority.

The fifth most profitable crime generating criminal profits according to Havocscope is illegal gambling which is not listed by FATF as a predicate or serious crime.

Bribery & Corruption

"We know what corruption has cost us – it has denied us the value of our resources, both human and natural. It breeds injustice. It causes killings. It causes diseases that ravage us everywhere"

Nuhu Ribadu, Head of Nigerian Economics and Financial Crimes Commission. 2006¹

Harms

There is no shortage of evidence as to the debilitating impact corruption has on society. It is indeed a cancer, as Senator Frank Church stated in 1976 and was reiterated some twenty years later by the former President of the World Bank James Wolfensohn.

Corruption thrives on weak institutions, political instability and vulnerability. It undermines democracy and the rule of law, leads to violations of human rights, distorts markets, erodes the quality of life and allows organised crime, terrorism and other threats to human security to flourish. Corruption blights countries, infects industries and raises the costs of living and commerce.

The economic damage and human misery that corruption can cause is visible in countries as seemingly diverse as those states where levels of corruption by, for example, Transparency International are considered comparatively high for example in the Euro zone such as Greece and Italy; countries devastated by long-term low-level warfare such as Afghanistan and Pakistan, and countries that are economically booming such as China and Malaysia.

Statistics

Estimating the dimensions of the money flows related to corruption either in terms of how much is paid or how much is laundered as the profits of bribery is virtually impossible. Still the World Bank in 2004 estimated that the annual total of bribes paid worldwide was US\$1 trillion² and the UN later in 2009 stated that political corruption costs up to US\$1.6 trillion.³

The World Bank also reported in 2012 that between US\$20-40bio is lost to corruption and other crimes each year in developing countries, amounting to some 20-40% of all international aid sent to developing countries each year.⁴

Transparency International Indices

Transparency International (TI) is a non-government organisation formed in 1993, which monitors corporate and political corruption. It has developed a number of different methodologies to try and measure corruption,

including the Bribe Payers Index and Industries most prone to corruption, and the Corruption Perception Index.

TI The Bribe Payers Index ("BPI")⁵

The BPI measures the likelihood of companies from industrialized countries bribing abroad. The 2011 BPI report concluded that Dutch and Swiss firms were the least likely to bribe abroad, while Russian, Chinese and Mexican companies were the most likely.

TI Bribe Paying Industries

The 2011 Report also evaluated the industries most prone to corruption. Sectors are scored on a scale of 0-10, where a maximum score of 10 corresponds with the view that companies in that sector never bribe and a 0 corresponds with the view that they always do. Public works contracts and construction were the sectors whose companies were most likely to bribe abroad. The least likely industries were agriculture and light manufacturing.

TI Bribe Paying Industries to Public Officials	TI Scale
Public works contracts & construction	5.3
Real estate & property legal & business services	6.1
Utilities	6.1
Oil & gas	6.2
Mining	6.3
Pharmaceutical & health care	6.4
Power generation & transmission	6.4
Heavy Manufacturing	6.5
Arms & defence & military	6.6
Fisheries	6.6
Telecommunications	6.7
Transportation & storage	6.7
Consumer Services	6.8
Forestry	6.9
Banking & finance	6.9
Civilian aerospace	7.0
IT (computers/software)	7.0
Agriculture, Light manufacturing	7.1

Source: Transparency International 2011

TI Corruption Perception Index ("CPI")⁶

The CPI ranks countries and territories according to perceived levels of public sector corruption on a scale of 0 (highly corrupt) to 10 (very clean). The 2013 Corruption Perceptions Index shows that no region or country in the world is immune to corruption. The majority of the 183 countries and territories assessed scored below five.

In 2013, the least corrupt countries according to the CPI were Denmark, New Zealand, Finland, Sweden, Norway and Singapore. The most corrupt countries were Somalia, North Korea, Afghanistan, Sudan, South Sudan Libya and Iraq.

Definition / Description

There are many faces of corruption and no one universal definition. TI defines corruption as "the abuse of entrusted power for private gain", which is simple and straightforward but fails to take account of private forms of corruption. Bribery is perhaps the most easily recognised form of widespread corruption.

Corruption can be described by many terms, including, "kickbacks", "payoffs", "Baksheesh", "graft", "payoff", "hush money", "tips", "grease", "bung" and "sweeteners" and comes in many forms, including, "nepotism", "cronyism" as well as "extortion".

Corruption is a crime committed by at least two parties, the payer and the beneficiary, who is often the payee, but oftentimes with others involved, particularly intermediaries or nominees. Whilst Corruption is usually demand led, this is not always the case, as the payer may initiate or offer a bribe, particularly where the interests of the payer is at stake.

Corruption can involve at least 4 main forms: Petty Corruption, Private Corruption, Organised Corruption and Grand Corruption (see later under money laundering for details)

Historical Background / Context

Corruption has a long history. Whether it is thirty pieces of silver, the price for which Judas Iscariot was bribed to betray Jesus Christ, or the US\$15-35bio, the Former Indonesian President Mohammed Suharto is estimated by TI to have embezzled, our history is unfortunately littered with far too many examples of it.

Ruthless and corrupt feudal lords and nobility ruling the Holy Roman Empire in the 13th Century earned their name in history as Robber Barons, by abusing their authority and imposing unjust tolls to passing ships on the River Rhine. The term Robber Baron was later

popularised in American literature during the Great Depression describing ruthless businessmen and later the industrialists in the so called "Gilded Age".

Another early example of corruption is seen in the Roman Catholic Church in the early 16th Century with respect to the sale of indulgences. Indulgences were pieces of paper that gave pardon for sins. Salesmen appointed by the Church commercially exploited the sale of indulgences and proceeds were used to fund Crusades and Churches, including St Peter's Basilica. The level of Corruption would cause a protest movement to emerge following Martin Luther's stand against the Church, provoking the reformation and the schism in Christianity. Following the reaction, the sale of indulgences was eventually prohibited in 1567.

Examples of corruption in more modern times continue to cover the full spectrum, from petty, private, organised to grand. Some periods of modern history deserve particular mention:

The Post War Period

Following the defeat of Nazi Germany and Imperial Japan, Independence movements would shape a new destiny for many countries, previously occupied and/or subject to Colonial rule. At the same time a cold war emerged offering leaders of new independent nations opportunities to position their countries in a new form of relationship both with their previous Colonial Masters and to court the great powers now seeking influence and support. The struggle during the Cold War between left and right was fought all over the world, with particular hotspots in Asia, Africa, the Middle East and Latin America. So called Soviet Satellite States, would emerge for example, Angola and Cuba as well as those countries that were bound inside the Iron Curtain in Europe. Chinese Maoist influenced States such as North Korea, Vietnam, Laos and Cambodia would also emerge but would also lead to the Korean and Vietnam wars killing millions. In order to stop the march of Communism many leaders would be supported by the West, though in so doing, the West would also be complicit in their activities including the Grand Corruption that took place during their reigns.

In Asia for example, when Mohammed Suharto came to power in Indonesia, in 1967, he became Indonesia's second President, following the ouster of Former President Sukarno. Sukarno had ruled since leading the Independence struggle from the Dutch in 1949. Throughout Sukarno's tenure as President factions from both right and left jockeyed for positions with Sukarno moving to the left, closer to the Soviet Union and China and away from the West. When Communists tried in

1965 to take over the entire state Suharto as then Army Chief of Staff put down the insurgency and soon gained the Presidency for himself with the support of the West. In the Philippines, President Ferdinand Marcos was at first a popular President when he was elected in 1965, quickly deploying troops to support the US in Vietnam.

In Africa, for example, Mobuto Sese Seko was made President of Zaire (formerly the Belgian Congo) in 1965, following the assassination of President Lumumba. For more than 50 years there has been great controversy over his death with many believing that the CIA were involved. Western concerns over the political independence of Lumumba were real, whatever the truth is about the assassination. Zaire was sitting on massive deposits of commodities, including uranium that was the chief source of nuclear materials, from which both the Hiroshima and Nagasaki bombs had been created. Another example of where post Colonial and Cold War politics provided the space for Corrupt Leaders to flourish, include the cases of the Francophile, Omar Bongo in the Gabon, President from 1967 to 2009.

In Latin America, the ideological struggle that had long since existed in the region, between states and régimes supported by the US and those that did not between states turning left or right. Those Presidential Strongmen, like Augusto Pinochet in Chile who was president from 1973 until 1990 and the father and son Presidents of Haiti ruling from 1957 until 1986, Papa and Bebe Doc Duvalier; and Alberto Fujimori, President of Peru from 1990 to 2000 aided by his security chief Vladimiro Montesinos, to name just a few, were for a time strongly supported.

Military, diplomatic and financial support by the West directly assisted these leaders in staying in power and in committing human rights abuses and leading to conditions where Grand Corruption was possible.

The West, in many of these cases finally withdrew support or indeed actively brought them down, for example, in the case of General Manuel Noriega.

The US Foreign Corrupt Practice Act (FCPA) and Bribery of foreign officials in international business transactions.

The Watergate scandal in the 1970s revealed the wide spread existence of slush funds being used by American multinational companies in order to make illegal political contributions. This prompted the US SEC to investigate certain non-disclosed questionable payments made to foreign officials. As a result, between 1975 and 1976, a number of US Senate hearings took place that

looked into the questionable payments. Led initially by Senator Frank Church, the investigations revealed that the practice of bribing foreign government officials was widespread but not illegal under US law. Well known American multinationals, particularly from the arms and petroleum industries, including Gulf Oil, Exxon Corporation, Mobil Oil Corporation, Northrop Corporation, and Lockheed Corporation admitted to making bribe payments of millions of dollars to various government officials in Saudi Arabia, Italy, Honduras and Korea in return for favorable treatment.

Although it was not illegal under US law at the time to pay a bribe to a foreign official, the companies had nonetheless taken great measures to distance themselves from the recipients of the bribes by using offshore slush funds, fictitious expenses and third parties described as "marketing agents" or "foreign sales agents" to pay the bribes to government officials who themselves held accounts offshore.

It was estimated at the time that over 400 US companies were found to have made questionable payments totaling approximately US\$300mio. The business industry argued that such payments were essential to remain competitive and maintain market share, at a time when their European counterparts could deduct bribe payments for tax purposes. In response to the investigation and with particular concerns to foreign policy and fuelling a new arms race, legislation was drafted to address the bribery of foreign officials. After various attempts and proposals to reign in the questionable payments under a self disclosed voluntary regime, the FCPA was passed in 1977 which today, makes companies criminally liable for bribery to foreign officials, whether directly or via an intermediary and requires controls and accounting standards to detect and prevent bribe payments.

It took almost 20 years before the international community addressed foreign bribery in international transactions. In 1996 the Inter American Convention against Corruption was adopted by the OAS. This represented a regional consensus about what States should do in the areas of prevention, criminalisation, international co-operation and asset recovery. Following this in 1998, the EU Council of Europe Criminal Law and Civil Law Conventions were adopted. Then came the OECD Convention on combatting Bribery of Public Officials in International Business Transactions in 1999. This would be followed by the UN Convention against Corruption (UNAC) signed in 2003 as well as the African Union Convention on Preventing and Combatting Corruption also in 2003. In 2009 the OECD made more Recommendations for

further combatting bribery of Foreign Public Officials in International Business Transactions. Most recently, after much criticism of the UK, came the UK Bribery Act 2010 which is now seen as one of the very toughest Anti-Bribery Statutes in force.

Post Soviet Collapse.

When the Berlin wall came down in 1989 and the Soviet Union was dissolved, the Post Soviet era would lead to a radical transformation in Russia and former Soviet Republics. The rapid transformation in post communist Russia during the 1990s, for example, saw assets transferred from public to private ownership via voucher privatization, loans for shares schemes and other auction schemes resulting in the rise of the Russian Oligarchs.⁷ At a time when approximately 40% to 50% of the population was living in poverty, the Oligarchs became billionaires through powerful government figures and through access to finance desperately needed by the Russian state. This resulted initially in a handful of individuals controlling Russia's major companies, particularly the natural resources industry and major newspapers and TV stations. These Oligarchs have often been likened to America's Robber Barons who also amassed great fortunes but also where they were for a time, questioned and where some fell foul of the law.

Arab Spring

The Arab Spring movement, which began in December 2010 has again focussed the world on leaders who acted as dictators, in Egypt, Libya and Tunisia. The exact amounts of stolen assets involved in the cases of Zine al-Abidine Ben Ali (Tunisia), Hosni Mubarak (Egypt) and Muammar Gaddafi (Libya) are still being determined, however, parallels between these modern day Kleptocrats and past cases of corruption can easily be drawn. These Former leaders of Egypt, Libya and Tunisia, together with their families and close associates are all alleged participants of endemic corruption, self enrichment and gross misuse of state funds.

As the Arab Spring unfolded it was alleged (though yet demonstrated) that Ben Ali and his wife allegedly stole 1.5 tons of gold worth US\$60mio from the central bank before fleeing Tunisia; of the lavish lifestyles of Gaddafi's family members including ownership of expensive real estate and an intertwining of public and personal interests in key state companies and industries; and in the case of Mubarak, common references are made to the "long arm of The Family" Mubarak's corrupt activities continue a long-standing tradition by Kleptocrats who, for example, amassed his own corrupt fortune by improperly taking advantage of business opportunities, but also directed business to

friends and family creating a powerful and loyal elite, much in the same way as Suharto and Marcos had long done before him and as other kleptocrats, such as Saní Abacha, Frederick Chiluba, Joseph Estrada, Saddam Hussein. Other leaders notably corrupt include Arnaldo Aleman, Pavel Lazarenko, Slobodan Milosevic as well as some less senior but still important public officials such as Diepreye Alamieyesiegha, James Ibori, Paulo Maluf. Current serving leaders or recently departed, facing allegations of corruption include Teodoro Obiang and Ali Zardari-Bhutto. Corruption by those holding political office is not limited to countries blighted by endemic corruption, but by all countries with the case of Randy Cunningham in the US a good example.

Money Laundering

As stated earlier, Corruption can involve at least 4 main forms: Petty Corruption, Private Corruption, Organised Corruption and Grand Corruption.

Petty Corruption is where an individual or a business is required to pay a bribe to a public official, often a minor one, for a service, for example in order to obtain a license or other permit or to avoid a penalty, for example a driving violation. The payment will often be made in cash via hand or envelope and spent without touching a financial institution. Whilst this is likely to be the vast majority in aggregate of sums thought to be involved in global corruption, details about actual size are by the very nature of the clandestine arrangements and the lack of the involvement of any responsible intermediary impossible to determine. At the margins, there are questions over whether an act is considered corrupt as opposed to a cultural norm. Take, for example, the long-standing tradition in Asian societies of gift giving. The giving of monetary gifts in red envelopes during holidays or special occasions (e.g. Lei See or HongBao) is an ingrained expected tradition in many Asian societies, there is no corrupt intent or expectation of reciprocity. Similarly, it is difficult to overstate the importance of Guanxi in Chinese society. Guanxi is based on the Confucian hierarchy of relationships, personal connections and favors and is an accepted and legitimate manner of interaction in China. Also take for example the commonplace demand by Irish American waiters in New York Restaurants where a tip is rarely optional.

Private Corruption is where the corruption takes the form of cash or other value passing from the payer to the payee for commercial information, documents or similar, for example, customer lists or other company business secrets. In this form of corruption a public official is usually not involved, unless the company is a state owned business for example.

Organised Corruption exists where organised criminal gangs will pay off a public official to ensure the gangs activities are not hindered or interrupted or that the gang is otherwise protected or granted a form of safe haven, for example to a local police chief who agrees not to investigate or interfere with drug trafficking routes through his area of control. More seriously where the state becomes protector of organised criminal gangs in exchange for money, for example in Panama at the time of President General Manuel Noriega or in Colombia when the Colombian Drug Cartels were at their most powerful and the Cartel of the Suns in Venezuela and Raúl Salinas in Mexico. Beyond Latin-America there is also the case of a terrorist organisation in the form of Al-Qaeda in Afghanistan, when Osama bin Laden paid off the Taliban to remain and be allowed relative freedom and autonomy within Afghanistan prior to the Attacks on America in 2001. Most successful organised crime gangs have managed to buy some level of protection or immunity, particularly in their home market. In the case of organised crime, the funds used to bribe will already be either available in cash or laundered and ready for use.

Grand Corruption is where the most senior figures in a country loot on a “Grand” scale the assets of the country. The funds stolen can originate from many sources including from i) the Central Bank or Sovereign Wealth Fund or similar domestic state owned enterprise ii) from cronies providing “kickbacks” for favors given; iii) by diverting either foreign development aid or loans for investment or foreign State subsidy to ensure continued friendly relations and political support and/or political alignment, or iii) commercial businesses seeking to gain contracts or concessions and to achieve success making funds available, often through intermediaries. The senior public figure may take these assets and funds for themselves, family members and close associates or cronies or they may also direct “funds” to ensure that the senior public figures’ position is maintained or consolidated, for example by directing funds for campaign finance or for bribes to potential opponents or to ensure support. Once the corruption reaches levels of state plunder and renders the State essentially non-viable a state of Kleptocracy has emerged.

Legitimate Companies may also pay bribes to PEPs, particularly Companies regularly winning public contracts in countries with high levels of corruption, where either a bribe is solicited or expected. Industries prone to bribes include Public Works and Construction, Oil and Gas, Mining, Real Estate and Property Development. In each case public officials play an important role in the procurement process and or

the provision of permissions licenses or consents. The amount of the bribe and the seniority or importance of the public official bribed will usually depend upon the size and importance of the underlying contract or transaction. For very large contracts the most senior public figures may be involved, for example, important members of the ruling elite. Examples include major companies such as Siemens, (infrastructure and transport) Statoil (Oil Services), Kellog Brown & Root (Oil Services) and Macmillan Publishing (Public Education)

One Industry which has experienced particular notoriety and claims that bribes are commonplace is the Arms Industry, where governments and leading defence companies trade with each other largely in secrecy and sometimes through Arms Dealers, for example the legendary Adnan Khosoggi. Landmark cases examples include Lockhead Martin, Bofors, BAE Systems and Thomson CSF Thales. A related Industry with Corruption concerns is the military services industry and in particular the operations of Private Military Firms. The use of Intermediaries was and is commonplace and can be a legitimate way of generating business. The use of Intermediaries however, less for their technical expertise and more for their connections to powerful procurement decision makers have often led to suspicions of corruption being raised in connection with Arms Deals but also with other large public sector works contracts. The recent case of Glaxo fined a record US\$3bio for corrupt type practices demonstrates that few industries are without risk.

In order to pay and receive bribes and continue other forms of Corruption, Bribe payers, Intermediaries and Public officials, particularly PEP's have developed elaborate methods to conceal or hide the true nature of the transaction. For example, the use of Intermediaries, complex and opaque structures, the use of cash and the involvement of front companies, family members or close associates. In the Company context, the Bribe is unlikely to be paid directly from the bribing Company to the corrupt PEP, but will often go through one or more Intermediaries after the bribe monies have been segregated from normal company funds or funds come from an already established “slush fund”.

In cases where companies have established a slush fund this has typically been outside the home country of the parent company, most often in an offshore centre or tax haven, with the funds being off-balance sheet or largely unaccounted for, and under the sole signature of a senior employee or even ex employee. These funds are collected perhaps as “rainy day funds” but are used for bribes to third parties, for example

to PEP's for the ultimate gain of the company in its dealings in the country where the PEP can influence decisions in the Company's favour. In order to secure an audience with and agreement from a corrupt PEP, bribe paying Company's have traditionally used trusted intermediaries, with the funds going first to an intermediary or agent acting on the company's behalf as a payment for services or an advanced commission. The amounts paid don't really reflect the services performed indicating that the intermediary will receive something for his involvement but recognising that he will be the conduit through which the bribe is paid, the Company and the PEP therefore seeking to insulate them at least in part from any direct involvement between themselves. These intermediaries will operate accounts and manage the monies to sever the paper trail from the incoming company funds to the transfer of value to the PEP in many different ways, for example using private investment company accounts in different banks and jurisdictions, withdrawals and use of cash. Intermediaries may also employ additional third party Intermediaries or engage with the family members or close associates of the PEP.

Corporate Enforcement Actions

Whilst the SEC has continued to prosecute cases of corruption, since the enactment of the FCPA in 1977, the numbers of cases continues to increase as do penalties for infringements as prosecutions continue to be a high priority area for the SEC. In 2010, the SEC's Enforcement Division created a specialized unit to further enhance its enforcement of the FCPA. Whilst not as active cases have been brought elsewhere too, including in the UK, Germany and France. By taking a closer look at the major cases prosecuted and the penalties levied mostly since 2010,⁸ for major cases resulting in penalties above US\$5mio and before for only the very significant cases, it can be seen that corruption isn't just a problem for emerging markets but is a problem for the most developed countries where household name marque companies, from the US, Germany, Japan, UK, Switzerland, France and Italy amongst them have all paid large fines for paying bribes, and fallen foul of the long arm of both US laws and US muscular enforcement and high tariff penalties with the most recent France's oil giant Total SA paying US\$398mio in connection with bribes to iranians for access to iranian oil and gas fields. Since 2010, fines and disgorgements levied have amounted to more than US\$3bio excluding US\$3bio fine for Glaxo in 2012 which whilst prosecuted under the US False Claims Act also included claims akin to bribery. Going back 5 years and including the Glaxo case penalties are approx US\$8bio and excluding it US\$5bio.

The top 10 cases since 2010 and therefore excluding Siemens (2008 - US\$1.6bio), Kellogg Brown & Root (2009 - US\$579mio) and Glaxo (2012- False Claims Act US\$3bio) (for more details see Part 2, Section 7, Criminal Cases) are as follows:

Top 10 Corporate Corruption Cases since 2010				
No		City	Date	US\$mio
1	<u>Thales</u>	Fr	2011	913
2	<u>BAe</u>	UK	2010	450

Source: Author				

Whilst massive illegal financial wealth has been accumulated over the years by corrupt PEPs and others and where much of this accumulated illegal wealth was stored offshore within financial institutions, historically in the PEP's own name or beneficially, and/or conspicuously consumed converting corrupt proceeds into high value goods, more recently the model of transfer and ownership is more likely in the name of others, for example family members or close associates or other “fronts” though effectively controlled by the PEP. Still further of these assets identified, little can be traced back to individual transactions or company initiated bribes.

Gifts and Entertainment

Whilst gifts and entertainment can be a routine part of any business in order to maintain a close relationship with clients, extra care must be taken when the recipient is a public official. Consideration must be given to the nature of the gifts and entertainment to ensure that it is reasonable and proportionate and there is little risk that the acceptance of such hospitality can or be perceived to compromise the official's judgment or integrity.

Counterfeiting & Piracy of Products

"Imitation is the sincerest (form) of flattery"
was first coined by the English writer Charles Caleb Colton in 1820 but it is doubtful that he had counterfeiting or piracy in mind.¹

Harms

The Counterfeiting and Piracy of products is not the victimless crime that much of the public thinks it is when they casually buy a "knock off" designer handbag or a "bootleg" copy of a movie or a music CD. These activities not only infringe the Intellectual Property rights of their owners and creators, stifle innovation and creativity, but may also place consumers at risk. Two of the fastest growing and most profitable counterfeit rackets surrounds counterfeit drugs and machine parts, where inferior products may have life threatening consequences. Because of the profits that can be generated from this illegal activity, organised crime are heavily involved and even terrorist groups have been known to turn to this source of income to fund their operations. Therefore, the purchase of these counterfeited or pirated products to save some money may ultimately result in the indirect funding of a terrorist attack or the support of organised crime activity.

Statistics

The OECD conducted a study on "The Economic Impact of Counterfeiting and Piracy" issuing its initial findings in 2008² and updating these in 2009.³ According to the OECD, international trade in counterfeit and pirated goods amounted to up to US\$250bio in 2007, an increase of more than 25% over the estimated figure reported for 2005 of up to US\$200bio. These figures do not include domestically produced and consumed counterfeit and pirated products, or the significant volume of pirated digital products being distributed through the Internet.

The OECD study estimates that in 2007, counterfeit and pirated goods accounted for a 1.95% share of world trade.

According to Havocscope in 2012 estimated total was US\$691.5bio.⁴ According to the Counterfeiting Intelligence Bureau (CIB) of the International Chamber of Commerce (ICC), counterfeit goods make up 5 to 7% of world trade, which is worth an estimated US\$600bio a year.⁵ Whether the market share is 2% or 7%, the number provides some context for how difficult

it is to detect counterfeit and pirated products given the massive amount of international trade that is conducted.

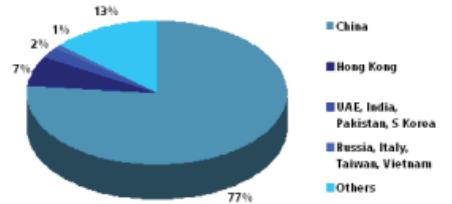

Proceeds from Criminal Counterfeit & Piracy		
Category Type	Est Amount	
1 Counterfeit Drugs	US\$200bio	
2 Counterfeit Electronics	US\$169bio	
3 Software Piracy	US\$63bio	
4 Counterfeit Foods	US\$49bio	
5 Counterfeit Auto Parts	US\$45bio	
6 Counterfeit Toys	US\$34bio	
7 Movie Piracy	US\$58bio	
8 Music Piracy	US\$12.5bio	
9 Counterfeit Shoes	US\$12bio	
10 Counterfeit Clothing	US\$12bio	
11 Cable Piracy	US\$8.5	
12 Video Game Piracy	US\$8.1bio	
13 Counterfeit Sporting Goods	US\$6.5bio	
14 Mobile Entertainment Piracy	US\$3.4bio

A study released in February 2011 from the Economic Institute Frontier Economics built on the OECD studies and updated their estimates for the value of the international trade in counterfeit and pirated products in 2008 to be between US\$285bio and US\$360bio.⁷ In addition, they developed a methodology to generate an estimate on the domestic production and consumption of such products to be US\$140bio to US\$215bio. Frontier Economics also estimated that in 2008

US\$30 to US\$75bio of digitally pirated products were distributed via the Internet. Lastly, the study projects that the estimated value of the counterfeit and pirated products in these three categories will be between US\$1,220bio and US\$1,770bio by 2015.

Source Countries for Counterfeit Goods

Source: US Customs 2005

In 2012 US Customs reported seized goods of over US\$1.2bio with China (906), Others (183), Hong Kong (156), Singapore (9) and India (7) making up the numbers.

US Customs (2005)⁸ also reported the most popular counterfeited commodities seized as follows: clothes (17%), handbags, wallets and backpacks (16%), cigarettes (10%), footwear (10%), consumer electronics (9%), toys and electronic games (9), computers and hardware (5%), watches and parts (3%), perfumes (3%), pharmaceuticals (2%) and others (15%).

Top 5 Counterfeit Brands

5	Louis Vuitton

Source: US Customs 2005⁸

According to US Customs, seizures of counterfeit goods increased from approximately 2,000 seizures in 2000, valued at US\$50mio to 13,000 seizures in 2009 valued at US\$250mio.⁹

Definition / Description

To counterfeit means "to make a copy of, usually with the intent to defraud; forge." Piracy,¹⁰ in relation to products, refers to "the unauthorized use or reproduction of copyrighted or patented material."¹¹ Counterfeiting and Piracy are terms that are used to

label a wide spectrum of illegal activities that involve the infringement of Intellectual Property rights such as trademarks, copyrights, patents and design rights. Although the products targeted for Counterfeiting and Piracy used to be mainly luxury goods in order to take advantage of the high value of the imitated product, the scope of product is now wider. Counterfeit designer items such as clothing and watches are still common but one can also find items that could threaten personal health and safety such as pharmaceutical products, illegal drugs, automotive replacement parts, food and drinks. As expected given the wide use of the internet and personal computers, digital piracy of music, movies and software continues to grow. One of the oldest items counterfeited and still imitated is the forgery or counterfeiting of currency, which is its own "Category of Offense" in the FATF Recommendations¹² in addition to the Counterfeiting and Piracy of Products category.

Historical Background / Context

Counterfeiting has a long history, with currency over the years being its principal target. The first monetary coins were made in Lydia, Asia Minor (today Turkey) circa 640 - 630 BC out of electrum, a naturally occurring alloy of gold and silver. Early coins were counterfeited by shaving the edges of the coin (referred to as "clipping") and then using the shavings to make new coins. Currency that consisted primarily of pure gold or silver coins (such as those minted by the early Romans) were counterfeited by mixing various cheaper metals together, casting them as coins and plating them with gold or silver. Those caught, would be punished by death. Images of paper currency printed by Benjamin Franklin in 1777 contain the phrase "To Counterfeit is Death" as it was considered a crime against the state because it was putting the economy in jeopardy. More recently, the english crown created fake continental american dollars during the American Revolutionary War and flooded it into the American economy to the point that the real currency became worthless. Another account of using counterfeiting as a mean of warfare took place during WWII by the Nazis who forced Jewish artists in the Sachsenhausen concentration camp to create counterfeit British pounds and American dollars. Although the quality of the counterfeit bills was very good, the Nazis were unable to execute the plan and the counterfeits were found and destroyed. The Counterfeiting of money continues today and, although the US Secret Service was formed in 1865 expressly to stop the spread of counterfeit US dollars, they are still produced and some high quality counterfeit one hundred-dollar bills have earned the name "Superdollars". The actual creators of these Superdollars are unknown but the US government

believes they are produced by North Korea. While the penalties associated with counterfeiting money are no longer death, they are still more severe than the penalties associated with the Counterfeiting and Piracy of products. In addition, the anti-counterfeiting measures applied to currency are high tech and always evolving. For this reason, although organised criminal gangs are using the latest technology and printing techniques to quickly produce notes of a high quality, most criminals tend to focus their energies on other products where the risk of detection is lower along with the potential penalties. In addition, with the expansion of the internet and digital products in general, the distribution of counterfeited goods and the pirating of digital products in an online environment is quick and easy to do.

Counterfeit products also have a long history, with arguments over the right to copy dating back for example to 600 AD with a dispute in Ireland about a copy of a "Psalter". In the 15th and 16th centuries with the coming of age of printers, laws were developed to control and regulate the output of printed books and materials. The first copyright law, a cornerstone of Intellectual Property rights, goes back to 1709 and the UK "Law for the Encouragement of Learning, by vesting the Copies of Printed Books in the Authors or purchasers of such Copies."¹⁵ Even older is the history associated with trademarks where early versions can be seen in the form of quarry marks on Egyptian structures or "Potters marks" from the Greek and Roman periods. Later, marks or symbols called a "merchants mark" were used increasingly by traders and merchants around the 10th century to establish ownership of goods.

Money Laundering

Despite the size of this market and the undoubtedly massive profits generated by the sale of counterfeited and pirated products, little is available to indicate how the proceeds from these crimes are laundered. Where organised crime is involved, it is assumed that criminal proceeds will be laundered using their existing networks and on the basis of existing available conduits. When we shine a spotlight on the top ten counterfeit / piracy markets, we can gain a better understanding of how large each of these markets is and their impact on society. For a well articulated explanation of the problem and the potential risks and responses for Banks see "Counterfeiting - the US\$650bio Challenge" by Nicholas Kochan.¹⁴

Counterfeit Drugs

According to a 2010 Reuters article, the counterfeit drugs industry is estimated to be worth US\$200bio a year.¹⁵ As the average black market is US\$32.38bio, this makes counterfeit drugs by far the number one

market. A 2012 Reuters article reports that the World Health Organisation (WHO) estimates that around 10% of all drugs around the world are counterfeit.¹⁶ In less developed countries, the percentage of counterfeit drugs in circulation could be as high as 33% (WHO estimated that between 30 to 40% of all drugs and medicine in Pakistan is counterfeit), while in developed countries the rate of fake drugs is less than 1%. This data is supported by a scientific study conducted by the National Institute of Health in the US that found that up to one-third of all malaria drugs taken around the world are counterfeit. The fake drugs and other poor-quality drugs are causing resistance to malaria and failure of treatment. This is a serious issue as around the world as 3.3 billion people are at risk of malaria and it is considered an epidemic in 106 countries. Between 655,000 and 1.2 million people die every year from Malaria according to the BBC News.¹⁷ The head of the Liberia Medicines and Health Products Regulatory Authority stated that up to 60% of the drugs that are on the market in Liberia are counterfeit.¹⁸ The fake drugs enter the country from Guinea on the back of trucks that are not inspected at the border. Many Liberians purchase their medicines from street vendors. Whereas in China, during the two year period from July 2009 to July 2011, police investigated over 42,000 cases of counterfeit drugs and shut down 1,093 illegal websites that were selling fake drugs.¹⁹ Yet despite the life threatening seriousness of the issue (e.g., in Pakistan over 100 patients died at a single hospital due to taking counterfeit heart medications²⁰), the President and CEO of the Pharmaceutical Research and Manufacturers of America stated in March 2012 that the average jail sentence for someone selling counterfeit drugs in the US is three years.²¹

Counterfeit Electronics

2009 Havocscope statistics show that counterfeit electronics are the second largest counterfeit market worth US\$169bio. Meanwhile, in early 2012 it was reported by ZDNet that the number of counterfeit parts entering the supply chain in the global electronics manufacturing industry have quadrupled since 2009.²² In May 2010 it was estimated that 5 to 20% of electronic components in a supply chain is at risk of being counterfeit.²³ 64% of counterfeit electronics sold to consumers in the US takes place in legitimate retail stores, according to Gallop consulting and the US Chamber of Commerce. But this does not just take place in the private sector as the US Navy estimated in early 2012 that up to 15% of all replacement electric circuits and spare parts bought by the entire US Military to be counterfeit.²⁴ The US Senate reported in 2011 that 70% of counterfeit electronics sold to the US Military was traced back to China.²⁵

Software Piracy

In a May 2012 report, search engine company Google reported that it takes down over 1 million links to websites selling counterfeit goods and pirated materials a month.²⁶ The 250,000 links taken down in an individual week in 2012 is more than the total number of links taken down in 2009. The report showed that Microsoft had the most links taken down by Google to enforce their copyrights, with 520,289 links to sites selling pirated software being taken down in the past month.²⁷ This is consistent with a statement in the Wall Street Journal in May 2011 by Microsoft President Steve Ballmer who stated that the company loses 95% of its possible revenue in China due to software piracy.²⁸ According to the US Ambassador to China in December 2011, the sales of legitimate software is higher in Vietnam than in China, despite China having over 15 times the population of Vietnam. Software piracy is believed to be the cause for the low level of sales in China, with an estimated 78% of all software installed on PCs in the country being pirated copies.

The Business Software Alliance reported in its Global Software Piracy Study that US\$63bio was lost to pirated software around the world in 2011.²⁹ The amount lost to software piracy in 2011 was higher than the US\$58bio reported in 2010,³⁰ which was in line with the 2009 statistics reported by Havocscope of US\$58.8bio. Losses in the US due to software piracy in 2011 were US\$9.7bio and the countries of the EU lost US\$14bio. These figures do not include the amount of taxes lost to piracy nor the number of jobs.

Top 10 Countries - 2011 Value of Software Piracy Losses

1	US	US\$9.773bio
2	China	US\$8.902bio
3	Russia	US\$3.227bio
4	India	US\$2.93bio
5	Brazil	US\$2.848bio
6	France	US\$2.754bio
7	Germany	US\$2.265bio
8	Italy	US\$1.945bio
9	UK	US\$1.943bio
10	Japan	US\$1.875bio

Source: Havocscope³¹

Counterfeit Foods

Counterfeit foods around the world creates a US\$49bio a year industry, according to the World Customs Institute in February 2010.³² In the UK alone it is estimated to be a US\$9bio market annually. In April 2009, it was estimated that 10% of the entire food market in the UK was counterfeit.³³ The products globally range from honey to fish and the risks range from just financial to health risks. Some of the more common counterfeited products that seem to just pose financial risks are fake maple syrup, where the expensive maple sugar is substituted in part or entirely with cane sugar, or seafood species that are a different species from the promoted fish name (for example, 77% of fish tested that were labelled for sale as red snapper were actually found to be tilapia, according to a study by the University of North Carolina).³⁴ Luxury food products that emanate from a particular region are often replaced with substandard products but labeled falsely as "French truffles" or "Emmentaler" cheese. One of the most frequently counterfeited products is olive oil. Due to the role of organised crime in Italy, a report found that 80% of the olive oil produced in Italy and stamped with a "Made in Italy" logo was made with cheaper, lower quality oils from other countries. According to research conducted by Food Safety News in 2011, up to 75% of honey that is sold in stores is not real honey since it does not contain pollen. Although consumers may not notice a difference in taste, separate tests found a third of the faux honey imports from Asia were tainted with lead and antibiotics.³⁵ Even more concerning is the production of counterfeit baby formula, which can affect an infant's development since it is not likely to have the recommended levels of protein and other nutrients; in the worst cases, it can lead to death (e.g., in 2004, more than 60 Chinese infants died after ingesting fake formula).³⁶

In late 2011 an operation was coordinated by Europol and Interpol, when they targeted organised crime in a food fraud crackdown. "Operation Opson" (Opson means "food" in ancient Greek) was carried out over a week and spanned 10 countries (Bulgaria, Denmark, France, Hungary, Italy, The Netherlands, Romania, Spain, Turkey and the UK). Authorities confiscated more than 13,000 bottles of substandard olive oil, 30 tons of fake tomato sauce, about 77,000kg of counterfeit cheese, more than 12,000 bottles of substandard wine, five tons of substandard fish and seafood, nearly 30,000 counterfeit candy bars and investigated fake/substandard caviar being sold on the Internet.³⁷ Europol stated that the counterfeit market was a "high profit, low risk activity which undermines legitimate business and puts the safety of consumers at risk". Recent scares and the reaction in the UK

and Europe about horsemeat being used in “value” beef products is indicative of the lack of guarantees in control over and the reliability of some parts of the food chain.

Counterfeit Auto Parts

Counterfeit auto parts in China were estimated to hit US\$45bio in sales in 2011. Out of the total global counterfeit auto parts market, China is responsible for 83% of the counterfeit auto parts that include fake airbags and oil seals as well as spark plugs, brake pads and steering components.³⁸ IP enforcement officials estimate that between 20 to 25% of the auto parts supply market in the United Arab Emirates is made up of counterfeit parts.³⁹ The counterfeit auto parts originate from China, Taiwan, Turkey, Korea and Malaysia and are smuggled and imported into the country. In France, it is estimated that between 5 to 10% of all spare auto parts are counterfeit.⁴⁰ This same figure is attached to the EU where counterfeit auto parts make up between 5 to 10% of all replacement auto parts sold.⁴¹

More troubling are the statistics attached to counterfeit auto parts and lethal automobile accidents. According to a major auto parts supplier quoted in September 2011, up to half of all deaths caused by automobile accidents in Saudi Arabia are caused by the use of counterfeit auto parts, estimated to be a US\$3.4bio industry there. The parts are generally 20 to 30% cheaper to buy when compared to legitimate auto parts. India's Economic Times reported that in 2009, counterfeit auto parts in the country led to 25,400 deaths and over 93,000 injuries.⁴² This is in addition to the loss of legitimate income of US\$1.9bio a year and the cost to the government of another US\$386mio in taxes. The losses are even higher in Indonesia where counterfeit products caused tax losses of up to US\$4.8bio in 2010 with counterfeit automotive parts accounting for almost 17% of the sales.⁴³

Counterfeit Toys

Counterfeit toys is a US\$34bio illegal industry.⁴⁴ Counterfeit toys consisted of 7% of all counterfeit goods seized by EU authorities in 2010.⁴⁵ 98% of the fake toys seized originated from China. Counterfeit toys from China made up 3% of all seizures in FY 2010 by the US Customs and Border Patrol. The value of the seized toys from China was US\$3.7mio. The Anti-Counterfeiting Group estimated in 2011 that counterfeit toys made up to 12% of all toy sales in the UK. This is consistent with estimates provided by the Toy Industries of Europe in 2009 when they said one in ten toys in Europe could be counterfeit. In 2007, the losses to toy makers in Europe were already estimated to be US\$2.1bio annually.⁴⁶

Other country loss estimates were: Brazil US\$31mio, Australia US\$100mio and Mexico US\$1mio.⁴⁷

Movie and Music Piracy

The pirating of movies and music are lucrative black markets valued at US\$58bio and US\$12.5bio, respectively. Pirating is a global problem that continues to grow along with the Internet. Between 45 to 50% of all Internet users in Singapore are believed to access pirated entertainment content, according to the International Federation of the Phonographic Industry (IFPI) in May 2012.⁴⁸ There are around 300,000 incidents of illegally downloading of movies, music and other content each month. Up to 90% of all digital content provided to users on the Internet in Vietnam is pirated.⁴⁹ The content includes music, movies, software and mobile phone apps. According to a poll by Colombia University, 46% of all adults in the US reported pirating copies of a television show, movie or music recording.⁵⁰ 70% of those in the 18 to 29 year old bracket used pirated content, according to the report. According to a 2011 study by the Swiss government, as many as 2.61 million citizens living in Switzerland illegally downloaded pirated content from the internet.⁵¹

Movie piracy creates substantial losses to the film industries in numerous countries. In 2011, movie piracy in Germany created losses of US\$200mio to the film industry. Users in Germany illegally downloaded or viewed unauthorised streams of movies on 185 million occasions. In the same year, the music industry in Germany lost US\$660mio to pirated music.⁵² The Hong Kong Motion Pictures Industry Association (MPIA) estimated in April 2012 that its members lose up to US\$308mio to movie piracy on YouTube. Over the course of three days, the MPIA found over 200 films that were illegally uploaded on to the website.⁵³ The pirated content had over 40mio views on YouTube. The Director General of the Film Academy of the Philippines reported that movie piracy causes losses of US\$95mio to the country's film industry in 2011.⁵⁴

Music piracy is costly to many countries. 99% of digital music downloaded in China is pirated, according to the International Federation of the Phonographic Industry. As of 2012, China has nearly twice as many Internet users as the US, yet its digital music revenue per user is about 1% of the US.⁵⁵ The International Federation of the Phonographic Industry (IFPI) estimated that 28% of Internet users worldwide accessed pirated music online in 2011.⁵⁶

Counterfeit Shoes

Given that the estimated global black market value of counterfeit shoes is US\$12bio, it is no surprise that counterfeit shoes and athletic footwear were the most seized counterfeit items by the US Customs and Border Protection in FY 2010. Fake shoes accounted for 24% of all seizures, with 94% of the shoes originating from China.⁵⁸ This same trend is seen in other countries as it was reported in early 2012 that up to 12 million pairs of counterfeit shoes from China enter Colombia each year.⁵⁹ Mexico reports that up to 200 million pairs of counterfeit shoes enter the country each year as Mexico's crime groups focus their attention on the lucrative pirated goods market.⁶⁰

The counterfeit clothing and counterfeit shoes industry in Australia is estimated to be valued at over US\$658mio.⁶¹ The shoe maker Deckers Outdoor Corp., who makes the popular boot UGGs, reported that nearly 400,000 counterfeit pairs of UGGs were seized around the world in 2010.⁶² In one raid in China, 244,648 pairs of counterfeit UGGs were seized. According to the Korea Intellectual Property Office, 21,454 counterfeit Louis Vuitton products were seized in 2010, followed by 9,118 counterfeit Nike products. Nike shoes are considered to be the most counterfeited brand of shoes in the world.⁶³ One Nike employee told the New York Times that for every one legitimate pair of Nike shoes in the market, a counterfeit pair exists as well.⁶⁴

Counterfeit Clothing

The global black market for counterfeit clothing is estimated to be the same value as the counterfeit shoe market at US\$12bio.⁶⁵ Many of the same criminals that focus on pirating shoes also focus on clothing. As mentioned above, Mexico's crime groups are drawn

to lucrative counterfeiting markets and it is reported that counterfeit clothing in Mexico costs the legitimate clothing industry up to \$9.5bio a year.⁶⁶ France estimates they lose up to \$8.5bio a year to counterfeit goods in general. In 2011, police seized 8.9 million counterfeit goods items in France. Half of the products that were seized within the country were luxury goods items, such as clothes, sunglasses, and cosmetics. Louis Vuitton products were the most counterfeited items seized by authorities in France.⁶⁷

Along with luxury brand items, athletic and sports apparel items are often counterfeited. In 2011, over 60,000 counterfeit clothing and apparel items featuring US college athletic teams were seized by the Collegiate Licensing Company. The value of the counterfeit goods was worth over US\$1mio. Revenue from licensed collegiate athletics generates US\$4.3bio a year for the schools. In addition, there were 4,338 seizures of counterfeit athletic and sports apparel by the US Customs and Border Protection in FY 2010 worth US\$18.7mio. 75% of the clothing came from China.⁶⁸ The Russian Interior Ministry stated that 37% of all clothing sales in Russia are counterfeit clothing. The Ministry stated that most counterfeits are imported into the country, with minimal production of fake goods occurring within the country.

Counterfeit Banknotes

Counterfeiting of banknotes has always been a problem, especially with the introduction of color printers and computer image scanners. The ease of making paper, promotes criminal counterfeiting. Most banknotes are made from cotton paper with a certain weight and sometimes mixed with other textile fibers. Banks and countries have incorporated many types of countermeasures in order to keep the money secure such as embedded holograms, watermarks, special threads, etc. However, with the growth of technology, counterfeiting will remain a serious issue.

The FATF defined Counterfeiting Currency as a predicate offence for money laundering in their 40 Recommendations.⁶⁹ Since 2001, counterfeiting of Euro notes in Greece has been a problem and there were cases in the new member countries as well. In 2003,⁷⁰ there were reportedly 2,411 counterfeiting cases in Greece in which 4,776 counterfeit banknotes were seized. Also in 2003, Polish authorities arrested a gang suspected of creating and trying to introduce a million fake Euros into circulation. The European Central Bank continues to work on ways to combat counterfeiting and money laundering such as considering embedding radio frequency tags into the fibers of higher denomination banknotes since they pose the most risk.⁷¹

Drug Trafficking

[Opium] "prohibition would unleash Organised crime, allow others to step in and fulfill the insatiable demand for narcotics"

William Gladstone , British Prime Minister, 1870

Long considered the most profitable, it is now estimated that illegal drugs are the second most profitable global criminal enterprise after illegal counterfeit and piracy of goods. The Drug Trafficking industry is dominated by organised criminal gangs who are the major players controlling and connecting suppliers via ultimate users.

Harms

The negative consequences of illegal production, trafficking and distribution of illegal drugs is substantial and affects not only individuals who take and abuse drugs but also their families, friends, commercial businesses, governments and societies at large.

The most obvious effects of drug abuse can be seen at the drug user level in ill health, sickness and, ultimately death. Children whose parents and other family members abuse drugs often are physically or emotionally abused and often lack proper immunisations, medical care, dental care and necessities such as food, water and shelter.

The economic impact of drug abuse on businesses whose employees abuse drugs can also be significant, with many drug abusers unable to attain or hold full-time employment and those who do work may put other co-workers at risk. Businesses can also be affected because employees who abuse drugs sometimes steal cash or supplies, equipment and products that can be sold to get money to buy drugs. Moreover, absenteeism, lost productivity and increased use of medical and insurance benefits by employees who abuse drugs can affect a business financially.

The economic consequences of drug abuse severely burden government resources and, ultimately, the taxpayer in connection with both conducting the war on illegal drugs, targeting the transnational drug traffickers and the organised criminal gangs that operate to provide the supply to the domestic criminal gangs that control distribution to the users criminal acts aimed at funding their addictions and providing health and benefits to those in serious medical conditions or need as a result.

In so called Narco States where illegal drug production and/or trafficking is prevalent, the level of crime,

violence and corruption arising out of the drug trade threatens the very productive and functioning existence of these States.

Statistics

According to the UNODC Report issued in October 2011,¹ of the estimated US\$2.1 trillion in crime proceeds generated in 2009, about a fifth, or approx US\$411bio came from illicit drugs, with Cocaine being the highest earner at approx US\$85bio of the more dangerous drugs. The value of the global cocaine market is lower than it was in the mid-1990s, when prices were much higher and the market in the US was strong. In 1995, the global market was worth some US\$165bio, while in 2009, this had been reduced to just over half of that.²

Most Popular Illegal Drugs			Proceeds
1	Cannabis	125-203mio users	US\$140bio
2	Meths	14-57mio users	US\$28bio
3	Ecstasy	11-28mio users	US\$16bio
4	Opioids	12-21mio users	US\$68bio
5	Cocaine	14-20mio users	US\$85bio
	Est Totals	176-329mio users	US\$337bio

Source: UNODC 2009³

While Andean coca farmers earned about US\$1bio, the bulk of the income generated from cocaine was concentrated in North America (US\$35bio), followed by Western and Central Europe (US\$26bio).⁴ Approximately two-thirds of that total may have been laundered in 2009. Global use of cocaine remained largely stable in 2009. UNODC estimates that some 14 to 20 million people used cocaine worldwide.⁵

The global opiate market was valued at US\$68bio in 2009, with heroin consumers contributing US\$61bio of this. Heroin prices vary greatly. Although prices in Afghanistan increased in 2010, one gram costs less than US\$4. In West and Central Europe, users pay some US\$40-100 per gram, in the US and Northern Europe, US\$170-200, and in Australia, the price is as high as US\$230-370. While Afghan farmers only earned some US\$440mio in 2010, organised crime groups in the main countries of consumption reap the largest profits.⁶ Global use of opiates remained largely stable in 2009. UNODC estimates that some 12 to 21 million people used opiates worldwide; some three quarters of them used heroin.⁷

Cannabis remains by far the most widely produced

and consumed illicit substance globally. In 2009, it was estimated by the UN that 125-200 million people used cannabis at least once in that year. Some increases in cannabis use were reported from the Americas, Africa and Asia in 2009, whereas consumption in western Europe and Oceania remained stable or declined.⁸ Despite significant declines in recent years, the largest cocaine market continues to be that of the US, with an estimated consumption equivalent to 36% of global consumption.⁹

UN estimates that some 14 -57 million had used such ATS substances at least once in the past year. For the ecstasy-group for example was estimated at some 11 to 28 million. The predominant substance used varies between and within regions. Amphetamines-group substances dominate in Africa, the Americas and Asia, whereas for Europe and Oceania, the ecstasy-groups prevail. In North America, the two groups are nearly on a par. On aggregate ATS use generally appears stable or increasing, whereas for ecstasy, the trend was stable but decreasing in Asia.¹⁰

Definition / Description

Whilst the term drugs and narcotics are often used interchangeably, in fact drugs like marijuana, cocaine, speed and meth are not "narcotics." The word "narcotic" comes from the Greek word "narkos", meaning sleep. Therefore, technically "narcotics" are drugs that induce sleep, and would apply therefore to drugs such as opium, morphine and heroin. Cocaine and meth are "stimulants", the exact opposite of a "narcotic". They cause people to be more awake and more active, not sleepy.

The Single Convention on Narcotic Drugs of 1961¹¹ consolidated many earlier disparate Treaties and prohibited production and supply of specific drugs, including opium, coca, and derivatives such as morphine, heroin and cocaine and cannabis with a later Treaty the Convention on Psychotropic Substances 1971,¹² adding LSD, Ecstasy, and other psychoactive (Amphetamines and hallucinogens) followed by the UN Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances 1988,¹³ which for the first time introduced provisions against money laundering and other drug-related offenses. Drugs were identified and placed into one of 4 categories or schedules which would determine their perceived dangers to society. The most important perhaps are; Cannabis / Marijuana / Hashish; Amphetamine type stimulants (ATS) and Psychotropic Substances (hallucinogens); Opium / Morphine / Heroin and Cocaine.

Cannabis is both Marijuana (which is a mixture

made of flowers, leaves and small stems of Cannabis) and Hashish, (which is a paste made of the resins from the female flowers and is an intense coffee color). On the physical level, these drugs accelerate the heartbeat, swell the blood vessels and decrease psychomotor coordination. Marijuana and cannabis do not provoke physical dependence, but they can generate psychological dependence and regular use can induce anxiety, tension, insomnia, lack of appetite and temporary irritability.

Amphetamines is the name given to a group of synthetic stimulants¹⁴ which are chemically similar to adrenaline, the hormone used for 'fight or flight' emergencies. This class of drug works on the body's central nervous system and increases its activity. There are three main types: Amphetamines, Benzedrine, more commonly known as "Speed", Dexedrine (Dexedrine or "Dexy's Midnight Runners"); and methamphetamine (Methedrine or "Meth"), the most potent of the three. Amphetamine type stimulants (ATS) can be divided into two main categories: Amphetamines-group (mainly amphetamine and methamphetamine) and ecstasy-group (MDMA and its analogues). Examples of amphetamine substances, include speed, poppers and uppers and of methamphetamine, include crystal meth. Like crack-cocaine, it comes in larger crystals or rocks. When smoked, its effects are comparable to crack in intensity but are much longer lasting and it is highly addictive, since it directly affects the level of dopamine the brain produces.

Opium is made by drying the latex that is found within the opium poppy. It contains about 8 to 10% of morphine and a small amount of codeine. The morphine that is found within the opium is what makes it addictive. It comes in a tar like material. Users commonly smoke it to relieve pain or to get high. Heroin is synthesized from morphine. Heroin is stronger than morphine, and is very addicting. This drug is sold as a powder and in its most pure form, heroin is white, when it is cut (which is most of the time) it is a yellow or light brown color. This drug is most commonly snorted, smoked, or injected.

Cocaine is a powerful drug that comes from the leaves of the coca bush, a plant grown in South America.¹⁵ It's sold as a white powder that is most often snorted (inhaled through the nostrils), but it can also be dissolved in water and injected. Powder cocaine can be chemically changed to create forms of cocaine that can be smoked. These forms, known as "freebase" and "crack", look like crystals or rock.

Historical Background / Context

Man has experimented with drugs for thousands of years. For example, records in China dated to 2737BC show that cannabis was used for medicinal reasons whilst records of opium use predate that date in both Asia and Europe. The use of drugs like morphine (1805), cocaine (1806), heroin (1898) and amphetamines wasn't known until the 19th Century when they were isolated or synthesised by chemists. Latterly LSD was synthesised in 1938 and today a plethora of new compounds emerges regularly. The illegal production, trafficking and distribution of drugs began to flourish in the 20th Century and today is one of the most profitable criminal enterprises in the world generating huge profits for those involved.

Illegal Drugs	Class
Ecstasy; LSD; Heroin; Cocaine; Crack Cocaine; Magic Mushrooms; Amphetamines (if prepared for injection)	A
Amphetamines; Cannabis; Methylphenidate (Ritalin); Pholcodine	B
Tranquillisers; Some painkillers Gamma hydroxybutyrate; Ketamine	C

Opium / Heroin / Morphine

Opium had long been well established, particularly in China and considered a wonder drug. The opium poppy probably reached China through Arab traders who advocated its use for medicinal purposes. In Chinese literature, there are earlier references to its use. The noted Chinese surgeon Hua To of the Three Kingdoms (220-264 A.D.) used opium preparations and Cannabis for his patients to swallow before undergoing major surgery. By the late-1700s the British East India Company controlled the prime Indian poppy growing regions and dominated the Asian opium trade. By 1800, they had a monopoly on opium; controlling supply from mass cultivation in British India and setting prices, this despite the Chinese Imperial court banning its use and importation. In 1839 the Qing Emperor ordered his minister Lin Zexu to address the opium problem which was devastating the Chinese population. An estimated two million Chinese people became addicted

to the drug, with many lives ruined, including the son of the Imperial Emperor, who died after an overdose. Lin petitioned Queen Victoria for help but was ignored. In reaction, the emperor confiscated 20,000 barrels of opium and detained some foreign traders. The British retaliated by attacking the port city of Canton. Thus the First Opium War began. The Chinese were defeated and the Treaty of Nanjing was signed in 1842. The British required that the opium trade be allowed to continue, that the Chinese pay a large settlement, and that the Chinese cede Hong Kong to the British Empire. The Second Opium War began and ended in 1856 over western demands that opium markets be expanded.

The Chinese were again defeated and opium importation to China was legalized and the Chinese were forced to allow it in the Treaty of Tientsin, that substantial quantities of opium poppy to be grown on Chinese soil. Opium smoking was not limited to China, but was sold and smoked initially in opium dens in Southeast Asia, North America and France. It arrived in North America with the large influx of Chinese who came to participate in the California Gold Rush around 1850, disembarking from ships in San Francisco, the city's growing Chinatown became the site of numerous opium dens, run in basements or back rooms, in Chinese run laundries. By the 1870s, San Francisco's opium addiction led in 1878 to the city passing its first anti-opium laws. Opium Dens would also be established in other Cities where Chinese immigrants would establish themselves, for example, in New York. By the early 1900s there were an estimated 250,000 opium addicts in the US, as well as an estimated 200,000 cocaine addicts, supplied in various potions and concoctions derived from Coca leaf imports from Andean countries in South America. Elsewhere in North America, Vancouver in Canada would become an important opium trading centre and in Europe,

French expatriates returning home from their Indochinese colonies established numerous opium dens in France's port cities, particularly Toulon and Marseille. Despite promoting and continued profiteering from the trade of opium to China, the British began to see and respond to the damage drugs could inflict at home and in 1868 passed the Pharmacy Act which restricted the sale of opium to professionals. The profiteering was though on a grand scale and amounted in 1867 to around a fifth of the entire income earned by British India (£7mio). By 1905 the British government now embarrassed by its trade in opium, started to consider changing policy on the trade in opium. The UK and China signed a Treaty declaring the opium trade illegal in 1908, though the Treaty would take years to implement. Mounting international concern,

particularly over the spread and dangerous effects from opium which had reached worldwide epidemic proportions, led in 1909 the US, to initiate a series of intergovernmental meetings, first in Shanghai, and then at the Hague in the Netherlands in 1911, which resulted in the signing of the International Opium Conventions 1912 (Hague Convention) where signatory states pledged to curb the production, distribution and consumption of opium, morphine, heroin and cocaine, and to restrict the use of these materials to 'legitimate medical purposes.' Ratification and implementation was effectively suspended by the commencement of World War 1 but eventually the end of the War would bring about the opportunity in 1919, when Article 295 of the Treaty of Versailles incorporated the Hague Convention, and committed Versailles signatories at last to the implementation of its anti-drug measures. In the meantime some Countries, for example the US in 1914 had passed laws implementing the 1912 Hague Convention terms (the Harrison Act). Britain passed the Dangerous Drugs Act in 1920, which made it illegal to possess opiates without a doctor's prescription. Cannabis would be added in 1928. With demand still high for drugs like opium, and traditional suppliers no longer willing to supply, the market became dominated by illegal operators. In fact the Great British Prime Minister, William Gladstone (who liked to take a drop of opium in tea or coffee before making speeches) had predicted this very outcome in the event of prohibition in a debate in the British Parliament in 1870. He told Parliament that prohibition would unleash Organised Crime in the region and allow others to step in and fulfill the insatiable demand for narcotics. In 1925, a statistical control system of all transactions concerning narcotics which was to be supervised by a Permanent Central Opium Board was introduced as part of The International Opium Convention (the "Geneva Convention").

Amphetamines Type Stimulants (ATS)

Increased demand for Amphetamines and hallucinogens started in the US, in the 1960s centred first around San Francisco, where a century before, opium established itself in America as the 1960s ushered in a counterculture that led to social change. Out of this counter-culture, emerged a worldwide youth culture, in which drug use assumed a prominent and often integral role. The counter-culture movement took hold in Western Europe, with London, Amsterdam, Paris and West Berlin rivaling San Francisco and New York as counter-culture centres. One manifestation of this was the French general strike that took place in Paris in May 1968, which nearly toppled the French government. Another was the German Student Movement of the 1960s. In Central Europe, young people adopted the

song "San Francisco" as an anthem for freedom, and it was widely played during Czechoslovakia's "Prague Spring", a premature attempt to break away from Soviet repression. The rise in popularity of amphetamines coincided with the rise in popularity of a relatively new substance, LSD, and at its height in 1967 as the so called "Summer of Love" saw hippie culture reach its height. Lysergic acid diethylamide better known as LSD or acid, was known for its psychological psychedelic effects. LSD was first synthesized and accidentally ingested by Albert Hofmann in 1938, later being Introduced by Sandoz Laboratories, in Switzerland. Albert Hoffman would eventually establish himself and his company as one of the leading Pharma Conglomerates, under the name Hoffmann Laroche. In the 1950s, officials at the US Central Intelligence Agency (CIA) thought the drug might be applicable to mind control and chemical warfare; it certainly had mind altering qualities which were experimented with by many including pop stars such as the Beatles in the 1960s. The increased recreational use of drugs by youth culture in the Western world during the 1960s led to a political firestorm that resulted in a political backlash. In 1971, US president Richard Nixon initiated a policy calling it the War On Drugs, declaring drug use to be 'Public Enemy Number One'. The stance adopted by the Nixon regime took US drug policy to an even more aggressive level, fully committing the country for the foreseeable future to a law-enforcement solution to the problems associated with drugs. US policy has yet to emerge from this project, and continues to deploy its influence, economic, diplomatic and military in discouraging other UN countries from adopting any alternative approaches. In 1988, Ecstasy (MDMA) fueled a so called rave culture in the UK and beyond when ravers experienced a second Summer of Love. The youth movement rejected individualistic values based on the consumption of alcohol and sex, instead being 'Loved-up' on E, young ravers in their thousands danced away the night at outdoor festivals.

Cocaine

As recently as the late 1970s, many experts and public health officials wrongly believed that cocaine was a relatively benign substance and primarily of interest as a "recreational" drug. This would change within 5 years, with supply and dosage increasing. The production of coca in South America expanded from a cottage industry of small groups of subsistence farmers into a major agricultural business that was financed by organised families or "cartels." The manufacture and trafficking of cocaine became a multibillion dollar industry, with profit margins high enough that governments and entire legal systems became corrupted by the influx of cocaine industry money. Supplies of

cocaine into the US increased exponentially. During the early to mid-1980s, according to DEA reports, the estimated amounts of cocaine entering the US doubled and tripled year after year. These supplies of cocaine made the drug available in purer form and at a more affordable cost to consumers. The drug traffickers then realized that cocaine could be manipulated into so called "crack cocaine" which caused an American epidemic as the "crack" was then sold as small rocks in a mass retail operation, with rocks being sold at a cost of US\$10 to US\$20. This new product was extremely addictive and inexpensive and was readily available to a much wider user base. By late-1985 and early-1986, the retailing of crack cocaine had swept through most urban centres of the US. The introduction of crack into urban communities produced devastating consequences. Health-related problems, rapidly escalating rates of addiction, and an extraordinary wave of street crime and property crime swept through most major American cities. In many areas, American Street Gangs were central to the distribution and sales of crack. Warfare between American Street Gangs battling over turf resulted in many fatalities among gang members as well as innocent bystanders in the community. As drug-related crime escalated dramatically, legal penalties for sales of cocaine and crack were increased, and US jails and prisons rapidly filled with crack users, dealers, distributors, and those involved in the violence associated with the crack trade. In the late 1990s and into the first decade of the twenty first century, three-quarters of the world's annual yield of cocaine was produced in Colombia, both from cocaine base imported from Peru and Bolivia, and from locally grown coca and the Cocaine trade was dominated by the Colombian Cali and Medellin Cartels, both became notorious and the target of Colombian and US Law Enforcement.

In 1995 US President Clinton issued Executive Order 12978, "Blocking Assets and Prohibiting Transactions with Significant Narcotics Traffickers," under authority of the International Emergency Economic Powers Act¹⁶ and called upon the Treasury to target Colombian drug cartels using financial sanctions. Under this authority, OFAC launched the Specially Designated Narcotics Traffickers ("SDNT") programme. The objectives of the SDNT programme were said "to isolate and incapacitate the businesses and agents of the Colombian drug cartels by publicly exposing them, freezing their assets, and denying them access to the financial system and to the benefits of trade and transactions involving US businesses and individuals. The SDNT list referred to "527 companies and 815 individuals involved in the ownership or management of the 21 Colombian drug cartel leaders' business empires. The

businesses named as SDNTs range across industries and included drugstore chains, a supermarket chain, pharmaceutical laboratories, airlines, a medical clinic, hotels, restaurant service companies, radio stations, sports teams, communications companies, construction firms, real estate firms, investment and financial companies, consulting companies, offshore firms, horse breeding farms and other agricultural businesses, mining operations, maritime agencies, and a department store." Nevertheless and despite Herculean efforts to fight the mainly US led war on drugs and the expenditure of billions upon billions of dollars, victory remains elusive. With increased attention and prices on their heads, the Leaders in Cali, Gilberto and Miguel Rodriguez Orejuela, and in Medellin, Pablo Escobar would be brought eventually to justice, the former being captured, extradited and imprisoned in the US in 2006 and the latter through a bullet which would end his life in a shootout with Colombian Police in 1993. Until then and for over 20 years, these individuals and the Cartels would become the world's biggest and most profitable criminal narcotic organisations. In 1989, for example, Forbes magazine declared Pablo Escobar as the seventh richest man in the world, with an estimated personal fortune of US\$25bio. Whilst Cocaine production in Colombia remains high, Cocaine production dominates the Bolivian economy producing about 30% of the world's cocaine supply.¹⁷ With drugs accounting for a large proportion its whole economy dwarfing other legitimate sectors. Money Laundering is a serious problem in Bolivia with few effective controls. Peru is in a similar position but with a larger coca crop and a burgeoning poppy crop.

The 10 Drug Traffickers (last 50 years)		Net Worth

Money Laundering

Whilst the profits to be made in connection with the drug production, trafficking, and distribution of illegal drugs are huge, it is the drug traffickers who make most of the profits, ensuring the drugs get to market via established but evolving transit routes. Still whilst they are the single biggest group, the drug traffickers have to share the profits with producers and street gangs who largely sell to end users and with others involved in the process.

Cannabis

Cannabis remains by far the most widely produced and consumed illicit substance globally. Cannabis herb cultivation is widely dispersed as it is mostly produced for domestic or regional Markets. However, the countries most often identified as sources of cannabis resin are Morocco, Afghanistan, Lebanon, Nepal and India.¹⁸

Heroin

Heroin enters Europe primarily by two major land routes linking Afghanistan to the huge markets of Western Europe and the Russian Federation. The long-standing 'Former Yugoslav or Balkan or Southern route traverses the Islamic Republic of Iran (often via Pakistan - Iran currently has the largest prevalence of opiate consumption in its population globally and receives the bulk of Afghanistan's opium production, in part for consumption and for onward export, but also Iran also accounts for 84% of total global opiate seizures).¹⁹ Turkey, Greece, Albania and Bulgaria across South-East Europe to the Western European market, with an annual market value of some US\$20bio. Much of the Heroin is controlled in its passage via the "Southern Route" by the Turkish and Albanian Mafias. The northern route runs mainly through Tajikistan and Kyrgyzstan (or Uzbekistan or Turkmenistan) to Kazakhstan and into the Russian Federation, Russia (and is sometimes colloquially referred to as the 'silk route') with an annual market value estimated at approx US\$5bio per year. Much of the Heroin is controlled in its passage via the "Northern Route" passing through Central Asia for Russia and Western Europe by the Russian Mafia.

Whilst many have accused Triad gangs of involvement in cross border drug trafficking. A US Justice Department funded report published in 2007 into drug trafficking between Myanmar and China noted that the Hong Kong drug trade is primarily dominated by loosely connected individuals of Chinese descent BUT there is no evidence to suggest any direct link between regional drug trafficking and Hong Kong / Chinese Triads. This study provides first hand data

depicting how Chinese drug traffickers operate in the Golden Triangle and surrounding countries.²⁰ Law enforcement sources in the region seemed to agree that Chinese nationals are almost always involved in major drug raids. According to the Australian Federal Police noted most major drug manufacturing and trafficking activities in Southeast Asia and elsewhere in the Pacific region are linked to Chinese criminals.

Unregulated and internal money transfer systems also play a major role in Money Laundering related to Heroin Trafficking. In and around Afghanistan for example and because of the lack of a modern banking sector, financial transactions are handled mainly by the hawala system.

In Faizabad, for example, during certain times of the year it is believed that close to 100% of the liquidity of the hawala system in this province is derived from drugs, whereas in Herat, the Northern Alliance stronghold, it is believed that only 30% of the hawala market's overall transaction volume is directly linked to drugs. The southern region (Helmand and Kandahar provinces) is also a key centre for money laundering in Afghanistan (about 60% of the funds are drug related and 80- 90% of the hawala dealers in Kandahar [the Taliban stronghold] and Helmand are involved in money transfers related to narcotics). Helmand has emerged as a key facilitator of the opium trade, both between provinces and exports, while overall estimates of the local hawala markets' drug-related component of a similar order of magnitude to those in Kandahar. This finding adds weight to the notion that the major trading centres in these two neighbouring provinces should be treated as essentially one market. Bearing this in mind, the study calculated that Helmand could account for roughly US\$800mio of Afghanistan's drug-related hawala business and that Herat is the second largest contributor, with in the range of US\$300-500mio of drug money laundered annually. Furthermore, Dubai appears to be a central clearing house for international hawala activities. In addition, various cities in Pakistan, notably Peshawar, Quetta, and Karachi, are major transaction centres. It appears that even in the case of drug shipments to Iran, payments for them come into Afghanistan from Pakistan. The hawala system has been key to the deepening and widening of the "informal economy" in Afghanistan, where there is anonymity and the opportunity to launder money.

Cocaine

The US State Department estimates that 90% of cocaine entering the US transits through Mexico.²¹ Cocaine is moved from Colombia and other Andean countries (particularly Bolivia and Peru) and shipped in

numerous ways with most controlled by the Colombian & Mexican Drug Cartels. These include principally by land through Central America into and through Mexico or by air and transported to staging sites in northern Mexico. The cocaine is then broken down into smaller loads for smuggling across the US–Mexico border. The primary cocaine importation points in the US are in Arizona, southern California, southern Florida, and Texas. Typically, land vehicles are driven across the US-Mexico border. Sixty five percent of cocaine enters the US through Mexico, and the vast majority of the rest enters through South Florida, via smuggling routes throughout the Caribbean, in particular via the Bahamas Island chain. The traffickers use a variety of smuggling techniques to transfer their drugs to US markets. These include the commercial shipment of tonnes of cocaine through the port of Miami as well as airdrops in the Bahamian Islands or off the coast of Puerto Rico, mid-ocean boat-to-boat transfers and then fast speed boats to the Miami area. Lately even submarines are thought to be used. Unmanned subs are towed underwater so no radar profile and if towing boat approached it can ditch instantly so no evidence if boarded. Transponders allow later recovery on some. Cocaine is also carried in small, concealed quantities across the border by couriers known as “mules” (or “mulas”), who cross a border either legally, for example, through a port or airport, or illegally elsewhere. The drugs may be strapped to the waist or legs or hidden in bags, or hidden in the body. If the mule gets through without being caught, the gangs will reap most of the profits. If he or she is caught however, gangs will sever all links and the mule will usually stand trial for trafficking alone.

In December 2010 the government of Spain remarked that Mexican Cartels have multiplied their operations in that country, becoming the main entry point of cocaine into Europe. The Mexican Army crackdown has driven some cartels to seek a safer location for their operations across the border in Guatemala, attracted by corruption, weak policing and its position on the overland smuggling route.²² The smugglers pick up drugs from small planes that land at private airstrips hidden in the Guatemalan jungle. The cargo is then moved up through Mexico to the US border. Guatemala has also arrested dozens of drug suspects and torched huge cannabis and poppy fields, but is struggling. In February 2009, Los Zetas Cartel threatened to kill the President of Guatemala, Alvaro Colom. On 1 March 2010, Guatemala's chief of national police and the country's top anti-drugs official have been arrested over alleged links to drug trafficking. A report from the Brookings Institution warns that, without proactive, timely efforts, the violence will spread throughout the

Central American region. Mexican and Colombian Drug Cartels have established bases in West African nations. They are reportedly working closely with local criminal gangs to carve out a staging area for access to the lucrative European market. The Colombian and Mexican Cartels have discovered that it is much easier to smuggle large loads into West Africa and then break that up into smaller shipments to Europe - mostly Spain, the UK and France. Higher demand for cocaine in Western Europe in addition to North American interdiction campaigns has led to dramatically increased trafficking in the region: nearly 50% of all non-US bound cocaine, or about 13% of all global flows, is now smuggled through West Africa.²³

Black Market Peso Exchange

The Colombian Drug Cartels have developed and employed the Black Market Peso Exchange. For details about how this works and other laundering techniques see Part 1, Section 1, Smuggling; Cash Smuggling below and Part 1, Section 2, Sub-section 2, Money Services Businesses below.

Amphetamine Type Stimulants (ATS)

Africa is a region of concern with regard to the trafficking of ATS. Trafficking of methamphetamine from Africa was reported first at the end of 2008 and reports have continued since. West Africa, in particular, is emerging as a new source of methamphetamine for illicit markets in East Asia, with couriers transiting Europe, West Asia or East Africa. Precursor chemicals are also frequently trans-shipped through the region. In India, the first clandestine ATS manufacture operation was detected in May 2003. Since then, several additional facilities have been uncovered. Attempts at illicit ATS manufacture has also been reported from Bangladesh and Sri Lanka. South Asia has become one of the main regions used to obtain ephedrine and pseudoephedrine for the illicit manufacture of methamphetamine. India is one of the world's largest manufacturers of precursor chemicals and Bangladesh also has a growing chemical industry. Amphetamine, methamphetamine and ecstasy have been regularly seized in South Asia over the past five years.²⁴

For more details about how Drug Traffickers operating as organised crime gangs and how they approach money laundering see Organised Crime below in this Part 1, Section 1 and for details of the leading Organised Crime /Drug Trafficking organisations see Part 2, Section 5, Criminals and Terrorists below.

Environmental Crime

*“Environmental degradation, over-population, refugees, narcotics, world crime movements and organised crime are worldwide problems that don't stop at a nation's borders”
Warren Christopher, 63rd US Secretary of State for under President Clinton¹*

Harms

Environmental crime is a serious and growing international problem, with criminals violating national and international laws put in place to protect the environment. These criminals are polluting the air, water and land. They are pushing commercially valuable wildlife species closer to extinction and they are significantly impacting the biological integrity of the planet. Once perceived as ‘victimless’ and low on the priority list, such crimes are increasingly the focus of government action. The impacts affect all of society. For example, illegal logging contributes to deforestation. It deprives forest communities of vital livelihoods, causes ecological problems like flooding, and is a major contributor to climate change. Up to one-fifth of greenhouse gas emissions stem from deforestation.² Illicit trade in ODS like the refrigerant chemicals chlorofluorocarbons (CFCs), contributes to a thinning ozone layer, which causes human health problems like skin cancer and cataracts.

Statistics

Environmental crime is currently one of the most profitable forms of criminal activity and it is no surprise that organised criminal groups are attracted to its high profit margins. Estimating the scale of environmental crime is problematic but Interpol estimates that global wildlife crime is worth billions of dollars a year.³ Interpol also reported that illegal logging was US\$30-100bio a year.⁴ The figure is much higher than the US\$15bio reported by the World Bank earlier with illegal logging destroying land the size of a football field every 2 seconds.⁵ The UN Environment Programmes reported that between 15-30% of the world's timber supply is provided by illegal logging activities.⁶

According to Europol, the trafficking of endangered species is worth US\$32bio with Europe the prime destination.⁷ For more on wildlife smuggling and poaching see Smuggling below.

As far as chlorofluorocarbons (CFCs), and ozone depleting Substances (ODS) are concerned, the 1990s saw around 38,000 tons traded illegally every year, equivalent to 20% of global trade in CFCs and worth US\$500mio.⁸ Since then, in 2006 for example still up

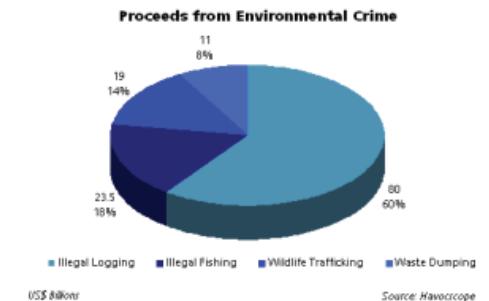

to 14,000 ton of CFCs were smuggled into developing countries.⁹

Illegal Fishing activities around the world account for 19% of the world's catches, according to the EU.¹⁰ The EU criticises Belize, Cambodia, Fiji, Guinea, Panama, Sri Lanka, Togo and Vanuatu for not doing enough to stop the activity.

According to the Federation of American Scientists,¹² the US Government estimates that local and international crime syndicates worldwide earn US\$22-31bio annually from hazardous waste dumping, smuggling proscribed hazardous materials, and exploiting and trafficking protected natural resources and that the tremendous costs for legally disposing of pollutants and dangerous chemicals have created new illicit business opportunities for criminal organisations, who earn US\$10-12bio per year for dumping trash and hazardous waste materials.

According to Havoscope the illegal fishing problem is upward of US\$23.5bio¹¹ with estimates for illegal logging at US\$30bio, for wildlife trafficking at US\$19bio and waste dumping at US\$11bio, amounting in aggregate to US\$83.5bio.

For Oil & Gas see Smuggling below.

Definition / Description

Environmental crimes can be broadly defined as illegal acts which directly harm the environment. They include: illegal trade in wildlife; smuggling of ozone depleting substances (ODS); illicit trade in hazardous waste; illegal, unregulated, and unreported fishing; and illegal logging and the associated trade in stolen timber, trafficking and use of illegal pesticides and the illegal diversion of rivers. They can also cover negligent acts which result in oil and gas spills or chemical and toxin releases or even nuclear accidents. Environmental crimes by their very nature are trans-boundary and involve

cross-border criminal syndicates. A tiger skin or an ivory tusk passes through many hands from the poaching site to the final buyer. A tree cut down illegally can travel around the world from the forest via the factory to be sold on the market as a finished wood product. In the era of global free trade, the ease of communication and movement of goods and money facilitate the operations of groups involved in environmental crime.

Environmental criminals, including those associated with organised crime, regularly cause permanent and extensive damage to ecosystems, which may result in serious human health problems. The incentives to carry out environmental crimes are financial, coupled with a perception, on the part of criminals, that they are unlikely to be caught and face severe penalties. Examples of environmental crimes which have become more common and lucrative are the trade of collectible species and illegal disposal of waste in an effort to avoid legitimate disposal costs, which results in an unfair competitive advantage for the criminals over legitimate, law-abiding businesses.

The focus on protecting the Environment has gradually increased across the World with more than 250 international and regional environmental agreements being developed in the thirty years since the first landmark UN Conference on the Human Environment in Stockholm in 1972. The US was one of the strongest proponents' of action, itself passing strong Environmental Protection Laws and began to enforce these.

Selected Major Fines for Environmental Crimes			
No	Name	When	US\$
1	BP - so far	2010/12	5.25bio
2	Exxon Valdez	1989	532.5mio
3	Union Carbide	1989	470mio
4	Walmart	2013	110mio
5	Amoco Cadiz	1978	85mio
6	Cunard Line	1996	23.5mio
7	Carnival Cruises	2002	18mio
8	Royal Caribbean	1999	18mio
9	Probo Koala	2006	€1mio

Source: Author (whilst fines can be large, the clean up costs can dwarf the fines, for example the Exxon Valdez cost more than US\$2bio)

In 1982, the US Environmental Protection Agency's (EPA) Office of Criminal Enforcement was established leading to an increase in prosecution of environmental crimes. Cases that demonstrate both public anger and a response by the authorities included action against Donald Distler, who was prosecuted for his contamination of the Louisville, Kentucky sewer system and sentenced

to two years in prison and fined US\$50,000, and the Kepone contamination episode in Virginia which resulted in fines of over US\$13mio. In 1992, The Convention on Biological Diversity was adopted under the auspices of the UN Environment Programme. Its aims are the conservation of biological diversity, the sustainable use of biological resources, and the fair and equitable use of benefits arising from the use of genetic resources. Interpol since 1992 has also taken a lead in identifying emerging patterns and trends in the field of environmental crime enforcement. For more details see for example Operation Worthy in Part 2 Section 7 below.

Historical Background / Context

The Industrial Revolution began in Britain in the 1700s, and spread to the rest of the world, at first Europe and the US and later elsewhere. The use of machinery and factories led to mass production, which in turn led to the development of numerous environmental hazards and damage, which would only be seen clearly years later. The use of factories and mass production has led to a depletion of certain natural resources, leaving the environment permanently damaged. One example of this depletion is deforestation, which is the clearing of forest trees for use in production. When the trees are cleared, the wildlife in the forest also becomes uprooted.

Deforestation - Over 50% of the world's animals and plants come from Brazil's rainforests, which also create 40% of the world's oxygen. Ranchers, farmers and loggers are responsible for the majority of rainforest destruction, mowing down over 10,000 acres of forest each year. Deforestation releases green house gases, which are readily contributing to climate change on a global level. As oxygen is crucial to the ability of all species to survive, rainforest destruction presents a threat of epic magnitude to every being on the planet. The lack of trees is only compounded by the problem of carbon emissions. Whereas forests would help emit oxygen and refresh the levels of healthy gases in the air, factories are emitting poisonous emissions and eliminating the oxygen source. The pollution that has resulted from factories involves not only airborne emissions but land and water pollution as well. The primary issue resulting from pollution and carbon emissions is that of global warming. As the temperature rises, the glaciers are melting and oceans are rising. More animal species are becoming endangered or extinct as a result of global warming. Another issue is Mountaintop Removal Mining.

Mountaintop Removal Mining (MTR) - MTR is a method used by mining companies to more cheaply extract coal by avoiding mining underground; instead Companies remove the top soil and trees or whatever is above the coal seam and then using explosives blast away at the earth until the coal seam is finally unearthed. The coal can then easily be removed by diggers and taken away by trucks. Once the coal is extracted the seam should be filled in and the area landscaped in such a way as to resemble the land as before. Despite good intentions, Environmentalists are critical of such

techniques which inevitably cause lasting damage to the environment. Overfishing remains a problem too.

Overfishing - this has had many detrimental effects on the environment, from changing the ecosystem to polluting the waters that so many creatures depend on for life. The climate of our world depends on the health of the ocean for stability, and overfishing has caused the populations of all fish to decrease over the last twenty years.

CFCs/ODs - Chlorofluorocarbons (CFCs) and other halogenated ozone depleting substances (OD's) are mainly responsible for man-made chemical ozone depletion. The ozone layer prevents most harmful ultraviolet light (UV light) from passing through the Earth's atmosphere and its depletion is suspected of causing a variety of biological consequences such as increases in skin cancer, cataracts, damage to plants, and reduction of plankton populations in the oceans which are at the base of the oceans' food chain. CFCs were invented by Thomas Midgley, Jr. in the 1920s. They were used in air conditioning and cooling units, as aerosol spray propellants and in many cleaning processes. Whilst the full extent of the damage that CFCs have caused to the ozone layer is not known, as this takes decades to fully see the results, the situation has improved following co-ordinated action after a 1976 report by the US National Academy of Sciences concluding that credible scientific evidence supported the ozone depletion hypothesis.

In 1985, 20 nations, including most of the major CFC producers, signed the Vienna Convention for the Protection of the Ozone Layer, which established a framework for negotiating international regulations on ozone-depleting substances. That same year, the discovery of the Antarctic ozone hole was announced, causing a revival in public attention to the issue. In 1987, representatives from 43 nations signed the Montreal Protocol. Still it would take until a 1992 meeting in Copenhagen, that a final phase out date was agreed being 1996. To some extent, CFCs have been replaced by the less damaging hydrochlorofluorocarbons (HCFCs), although concerns remain regarding HCFCs also. In some applications, hydrofluorocarbons (HFCs) have been used to replace CFCs. HFCs, which contain no chlorine or bromine, do not contribute at all to ozone depletion although they are potent greenhouse gases. More recently, policy experts have linked ozone protection efforts to climate protection efforts.

The upside of the Industrial Revolution has certainly been the mass production of food for an increasing world population and the massive increase in living standards and life expectancy. While the Industrial Revolution is the cause of positive change for the industrial world, there is no question that it has severely damaged the environment. The depletion of natural resources, the carbon emissions, pollution and human health problems, the effect on animals, the countryside, and many traditional peoples way of life's is the price paid so far.

The growth in the so called BRIC Countries, (Brazil, Russia, India and China) and others not so large but numerous have only exacerbated the problem. Some of the most devastating environmental disasters have occurred in the last 50 years, not only causing serious damage to the environment but also to human life and human health. Although many environmental disasters can be blamed on nature itself, hurricanes, tornadoes and earthquakes, there are still a few catastrophes that without doubt remain the fault of our species alone.

The most important of which include toxic chemical releases in Seveso, Italy, the so called Love Canal, US, Bhopal, in India, the Baia Mare cyanide spill, Romania and from the freighter Probo Koala; mining disasters, including the Spanish waste water spill in Aznalcollar, Spain and the Tennessee coal ash spill as well as damage from mountain top removal;

Notable Major Environmental Disasters	
1976	Seveso, Italy - Dioxin
1978	Love Canal, US - Toxins
1984	Union Carbide, Bhopal, India - Toxins
1986	Chernobyl, Ukraine - Nuclear
1986	European BSE Crisis - Livestock
1988	Great Pacific Garbage Patch - Trash
1991	Exxon Valdez, Alaska, US - Oil
1991	Kuwaiti Oil Fires - Oil
2006	Probo Koala - Waste
2010	BP Deepwater Horizon Gulf Mexico - Oil

Source: Author

Further there have been nuclear incidents in Three Mile Island in the US and Chernobyl, Ukraine; damage to the oceans from massive overfishing and waste dumping creating the Great Garbage Patch in the Pacific Ocean and the almost extinction of the Aral Sea from diverting rivers upstream; damage to animals and livestock for example the Bovine Spongiform Encephalopathy (BSE) Crises, in Europe; illegal and sustained deforestation particularly in Brazil but also for example in Indonesia from which regular Indonesian forest fires result and last but not least serious numerous oil and gas spills, including from the Amoco Cadiz, the Piper Alpha explosion in the North Sea; the Exxon Valdez sinking off Alaska; the Kuwaiti Oil Fires at the start of the Gulf War oil spills in the Niger Delta and the BP Deep-water Horizon spill in the Gulf of Mexico.

Money Laundering

The major motive for most environmental crime is financial gain. Environmental crime is not restricted

by borders and often involves criminals who engage in other crime types such as Murder, Corruption, Forgery and Fraud. A significant proportion of both wildlife and pollution crime is carried out by Organised Crime Groups, drawn by the relative low risks and high profit nature of these types of crime. The same routes used to smuggle wildlife across countries and continents are often used for smuggling Arms, Drugs and Humans and as for these crimes much of the proceeds are generated in Cash and the laundering of the funds are usually “cleaned” through Organised Crime laundering networks. Corruption presents a major hurdle to successfully combatting Environmental Crime. Corrupt Public Officials, trying to “cash in” have been involved in signing off on import and export certificates, facilitating the transport of illicit goods and ‘turning a blind eye’ as and when required. Far more serious, and yet just as common, is the complicit, long-term involvement of individuals from the police, army, government and intergovernmental organisations. Protected by familiar bureaucracies, weak legislation and poor enforcement, corrupt officials can thrive through environmental crime.

Whilst there have many sectors that have damaged the environment, none are more publicly followed by the media than the Oil & Gas sector, not in many cases for wilful or criminal acts but for negligent or unsafe practices which have led to some of the worlds most damaging environmental consequences. Beyond Oil & Gas, Waste Disposal and Waste Smuggling are an increasing cause also of concern, alongside Chemical and Shipping spills, damage to the Oceans and Seas and Livestock affecting the food chain.

Oil and Gas

Amoco Cadiz: In 1978 the Liberian super tanker Amoco Cadiz under charter by Amoco Oil Corporation lost control of its steering mechanism and soon became grounded off Brittany in France. The ship broke in two releasing 230,000 tons of crude oil, polluting approximately 300 kilometres of coastline, destroying fisheries, oysters and seaweed beds as well as many beaches and local Breton communities. Amoco was ultimately required to pay US\$85mio for the costs of the spill.

Piper Alpha: In 1988 an explosion occurred on the oil and gas production platform Piper Alpha in the North Sea, killing 167 out of 240 on board. The Cullen Enquiry was set up to establish the cause of the disaster, pointing to a leakage of natural gas building up beneath the platform, because of faulty maintenance work on a pump and a related safety valve, resulting in the ignition

of secondary oil fires and the melting of upstream gas pipelines. Piper Alpha's operator, Occidental, was found guilty of having inadequate maintenance procedures.

Exxon Valdez: In 1989 the American oil tanker Exxon Valdez ran aground in Prince William Sound in Alaska trying to avoid some small icebergs present in the region. The collision with the reef caused an oil discharge of 32 million gallons polluting 1900 kms of coastline. The oil spill killed approximately 250,000 sea birds, 2,800 sea otters, 250 bald eagles and possibly 22 killer whales. Exxon Mobil, the owner of the Exxon Valdez, was originally fined with punitive damages of around US\$5bio, equal to a single years profit for Exxon at that time. However, following appeals it finally agreed to pay a criminal fine of US\$25mio and a civil fine of US\$900mio and had the punitive damages reduced to US\$507.5mio. Exxon is thought to have spent more than US\$2bio for the clean-up operation. Ironically, official NOAA (National Oceanic and Atmospheric Administration) investigations have shown that most of the damage from the oil spill was caused by the cleaning operation following the disaster. It is claimed that pressure-washing was responsible for killing most of the marine life. In order to pay the fine, Exxon is thought to have obtained a loan from JP Morgan & Co, who themselves, had created the first modern credit default swap, so that Morgan's could protect themselves against the risk of Exxon's credit default.¹³

Kuwait Oil Fires: In 1990 Iraqi forces invaded Kuwait, leading to the 1991 Gulf War, which ejected Iraqi forces from Kuwait but left the regime is Saddam Hussein intact. In January 1991 ahead of the start of the Gulf War, Iraqi forces committed two environmental disasters. The first was a major oil spill 16 kms off the shore of Kuwait by dumping oil from several tankers and opening the valves of an offshore terminal. The second was the setting fire to 650 oil wells in Kuwait. Approximately one million tons of crude oil was discharged as a result, making this the largest oil spill in human history. It took until November 1991 before the last oil fire well was extinguished. The poisoned waters killed 20,000 seabirds and caused severe damage to local marine flora and fauna. The fires caused soot and toxic fumes to enter the atmosphere, having great effects on the health of the local population.

Niger Delta: In Nigeria, Shell is regularly criticized for Oil spillages into the Niger Delta, though the Company blames criminals and terrorists for much of the environmental damage. Since 2006 Shell has faced regular attacks by criminals and terrorists, who target pipelines, kidnap petroleum company workers and fight with government troops. The spillages occurred largely through intentional damage at a wellhead and

a bombing of a pipeline. Shell reported that 51 of its employees and contractors were kidnapped for ransom in 2009, compared with 11 in 2008.

BP Deep-water Horizon: The 2010 BP Deepwater Horizon, Oil Spill in the Gulf of Mexico, is the most recent and perhaps most significant oil spill in history when nearly 5 billion gallons of crude oil was discharged. A final report was released on the spill in January 2011. It blamed BP, Halliburton and Transocean for making a series of cost cutting decisions, as well as system issues putting safety at risk. It concluded that the spill therefore was not the fault of any rogue individual or company but by systemic company failures. BP agreed to pay an initial fine of US\$4.5bio in 2012 and admitted it was guilty of manslaughter. Additional civil fines of up to US\$17bio are still possible. The total bill for monies paid out or set aside so far is US\$42bio with estimates that the final cost may reach US\$60bio. Adding further fire to BP's fuel, the company settled in 2012 with the SEC, paying US\$525mio for incorrect statements made about the size of the flow of oil misleading investors.

BP had already pleaded guilty to a felony for failing to immediately report illegal dumping of hazardous waste by a contractor in 2000, the biggest-ever oil spill on Alaska's North Slope in 2006, and a 2009 pipeline rupture near the Lisburne Production Centre also in Alaska. In addition, “Occupational Safety and Health Administration (OSHA) statistics show BP posted 760 ‘egregious, wilful’ safety violations – while Sunoco and Conoco-Phillips each had eight, CITGO had two and Exxon had one comparable citation.” In two separate disasters prior to the Deepwater Horizon, 30 BP workers were killed and hundreds have been seriously injured. BP pleaded guilty to a federal misdemeanor in the 2006 oil spill, put on three years probation and had to pay US\$20mio in fines and penalties, plus US\$25mio to settle a civil lawsuit brought by the federal government. BP is not alone in the Oil Industry as having damaged the Environment.

Waste Disposal

Probo Koala: Beyond the Oil Industry, the transportation of hazardous materials is a major concern. The case of Trafigura and the Probo Koala is interesting. Trafigura was found guilty in a Dutch court for illegally delivering hazardous waste to Amsterdam on the freighter Probo Koala whilst concealing its true nature and then exporting this toxic waste to Ivory Coast, in 2006, which according to the Ivory Coast government led to the deaths of 16 people with thousands suffering health problems connected to

the waste. Trafigura was fined €1mio by the Dutch authorities and paid €33mio to the victims of the illegal dumping.

Chemicals

Baia Mare: The 2000 Baia Mare cyanide spill was a leak of cyanide near Baia Mare, Romania, into the Someş River by the gold mining company Aurul, a joint-venture of the Australian company Esmeralda Exploration and the Romanian government.

The polluted waters eventually reached the Tisza and then the Danube, killing large numbers of fish in Hungary and Yugoslavia. The spill has been called the worst environmental disaster in Europe since the Chernobyl disaster. The spill contaminated the drinking supplies of over 2.5 million Hungarians. Wildlife was particularly affected on the Tisza: on a stretch, virtually all living things were killed, and further south, in the Serbian section, 80% of the aquatic life was killed. Large quantities of fish died due to the toxicity of cyanide in the waters of the rivers, affecting 62 species of fish, of which 20 are protected species. For details on the toxic releases in [Seveso Italy](#) and [Bhopal India](#) see Part 2, Section 7 below.

Oceans and Seas

Whilst our oceans and the fish and seabirds that they support have been damaged by numerous oil and gas spills, water and waste dumping, as can be seen from the Cases above, two further examples demonstrate the damage being inflicted. These are the cases of the Great Garbage Patch and the case of the Aral Sea.

Great Garbage Patch: The patch exists in the North Pacific in a slowly moving, clockwise spiral of currents. The currents have brought together so much trash, 90% of it plastic, creating the largest landfill in the world. The UN Environment Programme estimated in 2006 that every square mile of ocean hosts 46,000 pieces of floating plastic.¹⁴ In some areas, the amount of plastic outweighs the amount of plankton by a ratio of six to one. According to Greenpeace more than 200 billion pounds of plastic the world produces each year, about 10% ends up in the ocean and 70% of that eventually sinks, damaging life on the ocean floor.¹⁵ The rest floats; much of it ends up in gyres and the massive garbage patches that form there.

Two large masses of ever-accumulating trash, known as the Western and Eastern Pacific Garbage Patches are known as the Great Pacific Garbage Patch. An Eastern Garbage Patch floats between Hawaii and California;

scientists estimate its size as two times bigger than Texas and a Western Garbage Patch formed east of Japan and west of Hawaii.

Aral Sea: The Aral Sea was a vibrant ecosystem in central Asia until massive diversion of the inflowing Amu Dar'ya and Syr Dar'ya rivers were allowed to provide irrigation water for local farmers. These diversions dramatically reduced the river inflows, causing the Aral Sea to shrink by more than 50%, to lose two-thirds of its volume, to wipe out fishing and to greatly increase its salinity affecting drinking water. Downstream, the salt pollution is decreasing the available agriculture area, destroying pastures, and creating a shortage of forage for domestic animals. The number of domestic animals in the region has become so low that the government has issued a decree to reduce the slaughter of animals for food. At the current rate of decline the sea is estimated to disappear by 2020. Diseases like anaemia, cancer and tuberculosis, and the presence of allergies, are on the rise. The incidence of typhoid fever, viral hepatitis, tuberculosis and throat cancer is three times the national average in some areas. Recent measures have been taken to change this disastrous state, through the International Fund for Saving the Aral Sea (UNEP, GRID Arendal, IFAS, 1997). If all measures are adhered to, a substantial recovery might be achieved within 20 years, although it is doubtful that the Aral Sea will ever be restored to the conditions that existed before the large-scale diversion of its inflowing rivers.

Livestock

BSE Crises: Bovine spongiform encephalopathy (BSE), commonly known as mad cow disease, made the headlines when the EU banned exports of British beef from 1996 until 2006. In the UK, the country worst but not only affected, more than 180,000 cattle were infected and 4.4 million slaughtered during the eradication programme. An inquiry into BSE concluded that it was caused by cattle, which are normally herbivores, being fed the remains of other cattle in the form of meat and bone meal (MBM), which caused the infectious agent to spread. The increased concern of BSE was that the disease could be transmitted to humans, where it is known as Creutzfeldt-Jakob disease which killed 166 people in the UK, and 44 elsewhere. Between 460,000 and 482,000 BSE-infected animals had entered the human food chain before controls on high-risk offal were introduced in 1989.

Shipping

Whilst fines for water discharging over the years

have been numerous and fines depending upon the seriousness of the case ranging from thousands of dollars to millions of dollars¹⁶ with the two largest being those levied below, the largest fine, for environmental damage by shipping was levied in 1996 against the Cunard Line for the actions of Royal Viking Sun, which struck a coral reef at the mouth of the Gulf of Aqaba, causing substantial damage to the reef. The company was fined US\$23.5mio. Royal Caribbean Cruises pled guilty in 1999 paying US\$18mio to settle US charges for fleet wide practices of discharging oil-contaminated waste, regularly and routinely discharging without a permit wastewater contaminated by pollutants through its ships' water systems, and making false material statements to the US Coast Guard. These practices for example occurred around Alaska, Miami, New York City, Los Angeles, Puerto Rico and the US Virgin Islands. Carnival Corporation pled guilty in 2002 to discharging oily waste into the sea from their bilges by improperly using pollution prevention equipment. In addition, it falsified its books in order to conceal its practices and as a result was fined US\$18mio.

Retailing

Walmart: One of the world's biggest retailers admitted in 2013 violating criminal and civil laws to protect water quality and agreed to pay more than US\$110mio in fines. Walmart employees regularly discarded hazardous materials such as pesticides, solvents, detergents, paints, aerosols and cleaners into municipal trash bins and into local sewers.

Nuclear

Whilst Nuclear has long been considered one of the safest and most reliable forms of power generation, not least because the consequences in case of major incident are potentially catastrophic, incidents have nevertheless occurred which have caused death and injury to life and harm to the environment. As well as the fall out from these incidents, the potential damage to the environment and the costs from used nuclear materials are increasingly causing concern.

Whilst the events at Three Mile Island¹⁷ in Pennsylvania in the US could be brought under control and a melt down avoided, the incident at Chernobyl near Kiev in the Ukraine was more serious. More recently the events following the tsunami in Japan, at the Fukushima nuclear power plant in Japan, whilst not man made, still serve to illustrate the potential dangers when nuclear power is compromised.

Extortion

"To count upon his virtue and use it as an instrument of torture, to practice blackmail with the victim's generosity as sole means of extortion, to accept the gift of a man's good will and turn it into a tool for the giver's destruction."
Ayn Rand, Novelist, Philosopher¹

From the schoolchild who gives up his lunch money to the bully for fear of getting picked on to the Hollywood depiction of wise guys "shaking down" a business owner for a monthly payment, Extortion shows up in our world in many different forms. The common element is that no one wants to be coerced into doing something they do not want to do or to live in fear because they had the guts to say no. Standing up to an Extorter is a brave thing but it is more difficult to do if the demand is coming from a Public Official or a member of an organised crime gang. Extortion is a word you often hear paired with the term organised crime. In fact, when one reads about the activities associated with specific organised criminal gangs, extortion is generally on the list. Many organisations that are designated as terrorist groups now function in the same manner as organised crime gangs in terms of how they finance their operations and Extortion is a common technique employed.

Harms

Besides the immediate fear of losing your life or a loved one's life and the stress that accompanies living with that fear, another harm of extortion comes from distorting trade as well as from the destruction of property that can often occur in tandem. Where extortion inflates the cost of business, it also distorts the playing field, protecting companies with connections from competition and thereby sustaining inefficient companies.

Statistics

Statistics related to extortion are very hard to come by and are most often combined with kidnapping or kidnapping for ransom statistics for obvious reasons. As with any criminal activity, it is very hard to get numbers surrounding the activity since the goal is not to get detected. This becomes even more difficult with Extortion since victims rarely report the crime to the police due to fear.

According to Havocscope, a crime statistics organisation estimates that, for example, in Mexico, up to 80% of all extortion attempts in Mexico go unreported. Of the reported cases of extortion, the number of cases has tripled between 2004 and 2011.²

Definition / Description

Extortion is the criminal activity by which any person (or entity) who, with a view to securing an unlawful gain (such as money, property or services) for himself or for another, coerces another person (or entity) to do something by using violence, or a threat with serious detrimental consequences (for example, financial loss, reputational damage, etc.).

Refraining from doing harm is often referred to as "protection." There is no global definition so each jurisdiction has its own that may emphasize certain points.

For instance, under US federal law, the definition makes it clear that Extortion can be committed with or without the use of force and with or without the use of a weapon. It further explains that it may be committed across a computer system, phone, by mail or in using any instrument of "interstate commerce" and that the person who sent the message must have "willingly" and "knowingly" done it.

The FATF define Extortion as a predicate offence for money laundering in their 40 Recommendations. Extortion is a form of Corruption and in its worst cases may also involve kidnapping and hostage taking or murder. Extortion is sometimes coupled with the word bribery but there is a distinct difference since bribery is the offering of something of value in order to get a certain wish met and Extortion is a threat of violence or other bad things if a certain wish is not met (obtaining something of value).

Further the FATF states in their Terrorist Financing Typologies Report that extortion may be used by supporters of terrorist and paramilitary groups to exploit their presence within expatriate or diaspora communities to raise funds through extortion. The criminals tax the diaspora on their earnings and savings. These extortions are targeted against their own communities where there is a high level of fear of retribution should anyone inform the authorities.

Historical Background / Context

Throughout history there are instances where different groups have used Extortion against others or even examples of countries extorting money from other countries. Of course the countries requesting "tributes" or special taxes for various reasons may not have viewed it as a form of extortion. In ancient China, the tribute system was formed as a means of trade regulation and it also allowed China to maintain authority over neighboring countries. The neighboring countries paid tributes (generally in the form of large sums of money)

to show their respect for China and gain the right to trade with them. In return, these countries maintained their own sovereignty and were not conquered by China.

Another early use of extortion that also involved the paying of tributes in order to avoid being attacked was utilised by the Barbary Pirates, a name derived from the “berber” people of North Africa, and a region similar to the Maghreb today, and home to Pirates and Slave traders from the 17th Century. Until 1776, American ships were effectively protected from the Barbary Pirates due to British treaties with the North African states. Morocco, after earlier recognising the US's independence, became the first Barbary power to seize an American vessel in 1784. Although the US secured peace treaties, it still was required to pay tribute for protection from attack. Payments in ransom and tribute to the Barbary states amounted to 20% of US government annual expenditures in 1800. The Barbary Wars in 1801 and 1815 finally led to the end of the payment of tributes by the US.³

Money Laundering

Extortion ranges from minor forms like the lone guy in the street who “offers” for a fee to watch your car in a bad neighborhood (so that it doesn't get stolen or damaged), to the demand for payment from a foreign government so that an oil rig is not dynamited. The Italian Mafia has long been associated with Extortion as are most organised crime gangs today. The Italian Mafia focuses on public sector extortion, the Japanese Yakuza on corporate extortion (or “Sōkaiya”), the Triads operate mainly by extortion from large Chinese ex-pat communities.

Terrorist Groups realise there is money to be gained through Extortion and it is one of the main sources of funds for ETA. The “revolutionary tax” is demanded by ETA from business owners in Spain, particularly in the Basque Country, under threats to them and their families. The Provisional IRA started demanding “protection” money from pub owners and other local shopkeepers and businessmen in the early 1970s in a very overt and threatening manner. Today, the extortion still continues but now the approach to a new business is made by a legitimate security company as opposed to a bunch of thugs waving weapons. In Russia and the other former Soviet states, there are around 6,000 mafia groups whose basic business is extortion. It is not surprising that former Ukrainian Prime Minister Pavlo Lazarenko was sentenced in 2004 to nine years in prison by a US court for extortion, among other crimes. Another leader that utilised Extortion during his reign was Francois Duvalier (known as Papa Doc) who was

the president of Haiti From 1957 to 1971. His son Bebe or Baby Doc Duvalier continued the practice when he succeeded his father.

The Japanese Yakuza frequently engage in a uniquely Japanese form of extortion, known as Sōkaiya. In essence, this is a specialized form of protection racket. Instead of harassing small businesses, the Yakuza harasses a stockholders' meeting of a larger corporation. They simply scare the ordinary stockholder with the presence of Yakuza operatives, who obtain the right to attend the meeting by a small purchase of stock. They also engage in simple blackmail, obtaining incriminating or embarrassing information about a company's practices or leaders. Once the Yakuza gain a foothold in these companies, they will work for them to protect the company from having such internal scandals exposed to the public.

Some companies still include payoffs as part of their annual budget, for examples see Part 2, Section 7, Criminal Cases, Glico-Morinaga and Kiyoshi Takayama. While the Yakuza use a more unique form of Extortion than other organised crime and terrorist gangs, the list of groups utilizing Extortion techniques is long. In one of its training manuals, Al-Qaeda refers to the “carrying out [of] threats (extortion) against other regimes if they do not give willingly”. In this case “one or two assassinations should be carried out so that the regime would realize that we are serious about our threats”. The same applies to international companies such as “pharmaceutical companies, airline companies, insurance companies and petroleum companies, big industrial companies and meat companies, fruit companies”. More examples using the technique of targeting the diaspora of a certain nation or group include the Tamil Tigers and Al Shabaab.

Extortion that involves a direct monetary payment as opposed to the performance of a service or the transfer of physical property is much easier to detect and would involve your classic monitoring for money laundering in terms of third party payments and the ascertainment of the purpose of the payment and the relationship between the third parties. When the third parties involved are Politically Exposed Persons (PEP) or connected with a sensitive industry or country, extra scrutiny is applied to the transactions.

Since Extortion is often coupled with other crimes and is often utilised by organised crime, the focus tends not to be solely on Extortion but rather on the organisation. Therefore, the money laundering methods may be similar as for other types of organised crime activities.

Forgery

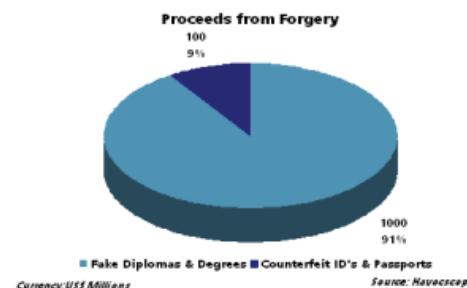

*“You utter a vow or forge a signature and you may find yourself bound for life to a monastery, a woman or prison.”
Bronislaw Malinowski, Anthropologist¹*

Harms

Forgers are used by both organised crime gangs and terrorist groups to further their criminal activities. For example, Riduan Isamuddin (aka Hambali), an Indonesian terrorist and the mastermind of the 2002 Bali attacks and alleged leader of Al-Qaeda-linked Southeast Asia terror group Jemaah Islamiyah, acquired forged passports which were then used by members of Jemaah Islamiyah to travel to Indonesia. The 2002 Bali bombings led to the deaths of 202 people.

Statistics

The nature of Forgery itself makes the accumulation of Statistics in order to size the crime very difficult. It is also the case that much of the systematic forgery, for example in relation to identification documents, occurs underground and the better the forgery the harder to detect. Evidence suggests that the forgery of Higher Education Certificates are probably the most prevalent and profitable areas, followed by forged identification documents including passports. According to Havoscope, estimates for proceeds from fake diplomas and degrees are US\$1bio and for fake IDs and passports US\$100mio.

Definition / Description

Forgery is the creation of a false written document, the alteration of a genuine document, or a signature falsely created or altered, with knowledge of the false nature and the intent to defraud. The Instruments of forgery may include bills of exchange, promissory notes, cheques, bonds, receipts, orders for money or goods, mortgages, deeds, public records, certificates of education or achievement, account ledgers, and certain

kinds of tickets or passes for transportation or events. Counterfeiting is often associated with forgery but relates more to physical goods as opposed to documents, though it does include currency.

Some areas of forgery are niche crimes and auxiliary to other crimes that generate more financial profit. Passport forgery is usually conducted by small workshops, and the method is often that they alter stolen passports. However, it is not easy to buy a forged passport since they are usually sold within criminal networks where relationships of mutual trust have already been established. These networks are global and cross the ethnic boundaries of different groups of organised crime. There are some areas of forgery that operate on an industrial scale and sell to anybody who is willing to pay. In these areas very sizeable profits are generated, for example, in the production of fake IDs for Americans under 21 years old who want to drink alcohol, and in the creation of forged educational and professional credentials. A high quality of fake US driver's licenses can be ordered for between US\$75 and US\$300 from merchants in China that produce and ship them in hidden compartments in shoes and other items. In the US city of Chicago alone, customs intercepted more than 1,700 fake IDs in the first half of 2011. US customs has estimated that ID forgers from China who are targeting this US market earn millions or even tens of millions of US\$ annually.² The forgery of educational credentials may be even more profitable and together with forged pay slips, these credentials can be used for example in fraudulent loan applications.

Historical Background / Context

The law of forgery may have originated with an early Roman law around 80 B.C. that prohibited falsification of documents describing the passing on of land to heirs. The precise scope of what was considered forgery at common law is not universally agreed upon, but a statute passed in the time of Queen Elizabeth I in the 17th century prohibited forgery of publicly recorded, officially sealed documents with the intent to affect the title to land, as well as the knowing use of such documents as evidence in court. In the first major expansion of the law's coverage, a 1726 decision declared that a false endorsement on an unsealed private document was indictable both under the Elizabethan statute and at common law. Writing only half a century later, William Blackstone was able to declare, after referring to several contemporary statutes, that “there is now hardly a case possible to be conceived wherein forgery, that tends to defraud, whether in the name of a real or fictitious person, is not made a capital crime”. Blackstone defined common law forgery, which he also called crimen falsi, as “the fraudulent making or altering

of a writing to the prejudice of another man's right." Pillory, fines, and imprisonment were the penalties in those rare cases that were not subject to capital punishment.

Perhaps the most famous case of forgery in the twentieth century took place in 1983 with the "discovery" of the Hitler diaries. The diaries supposedly contained passages written by German dictator Adolf Hitler between 1932 and 1945. Gerd Heinemann, a German reporter for Stern magazine, claimed the writings as genuine and sold them. He had obtained them from Konrad Kujau, a dealer in military memorabilia and documents. Newsweek and Paris Match, along with other media, paid more than US\$5mio for the documents. Major news sources around the world quickly published detailing the historical information that the diaries allegedly contained. Investigative experts from around the world later conducted forensic examinations on the diaries and found the documents to be forged. Kujau then admitted forging the diaries, and news sources immediately retracted their coverage. Both Kujau and Heinemann were sentenced to four and a half years in a German prison. Another famous forger of the 20th Century was Elmyr de Hory who successfully forged works of art, though died still a pauper.

In the US, the Mormon Bible forgeries resulted in more extreme consequences. Beginning in the early 1980s, Mark Hofmann, a disillusioned Salt Lake City Mormon and part-time dealer in historical documents, forged documents of major importance to Mormon history. He sold most of the creations to the Mormon Church and to others interested in Mormon religious history. Hofmann reaped hundreds of thousands of dollars from his fraud. His boldest forgery, the White Salamander letter, cast doubt on the credibility of the Mormon Church's founder, Joseph Smith. In this letter, Hofmann portrayed Smith as a dabbler in folk magic and the occult, which greatly distressed the Mormon community. When individuals within Hofmann's ring of buyers raised doubts about the authenticity of one of his later creations, Hofmann murdered one buyer and the spouse of another before their suspicions became public. Hofmann was arrested and charged with murder and fraud. The prosecution agreed to negotiate the charges to avoid an embarrassing trial for the Mormon Church. Hofmann pleaded guilty to Murder. In January 1988, the Utah Board of Pardons sentenced Hofmann to life in prison without parole.

The World Customs Union (WCU) helps promote international strategic cooperation in the fight against forged travel documents. In particular since the September 11th terrorist attacks, for national security

reasons, combating the forgery of travel documents are very high on the agenda of the US and other governments. Security features of passports and visa documents have vastly improved, and so has the security around the storage of blank documents. Nonetheless, there exist criminal syndicates that attempt to forge travel documents on a massive scale. Thailand is known as the capital for passport forgery since the act of forgery is considered a petty crime. After the September 11th attacks and after the Bali bombings in 2002, the Thai government has cracked down on forgery. In May 2008 Thai authorities seized 21,000 fake passports and in December 2009 Thai authorities arrested five people who allegedly produced and smuggled more than 300 fake EU passports.³

A recent conviction in the UK of a gang known as the History Men serves to illustrate how criminals profit from preparing forged identification and other documents. For more details see Part 2, Section 7, Criminal Cases.

Aside from the forging of travel documents, historical documents, and other documents one cannot ignore two of the most prevalent forged documents used by fraudsters, namely those used to perpetrate Prime Bank Guarantee and forged Promissory Note Frauds. Although promissory notes are legitimate investments, those that are marketed broadly to individual investors (especially the elderly) and entities including municipalities, charitable associations and others often turn out to be scams. The fraudster almost always presents a forged document promising guaranteed massive returns with little or no risk. Another tell-tale sign is the mention of secrecy and/or the claim that the investment opportunity is by invitation only or reserved for sophisticated investors, giving the fraud a claim of exclusivity. Similar tactics are used for Prime Bank Guarantee Frauds. For more details see Part 1, Section 1, Fraud below.

Money Laundering

Since most transactions involving forged identifying documents or travel documents are paid in cash little data is available that shows how proceeds of these forgeries are laundered. Where organised crime is involved it is assumed that criminal proceeds will be laundered using their existing networks and on the basis of existing available conduits. Forgers that operate on an industrial scale, like those in Thailand and in China creating fake identifying documents, may have similar networks for laundering criminal proceeds as the organised criminal networks. However, those who operate in small cells or alone will most likely use their criminal proceeds for personal use.

Fraud incl Tax Fraud & Cybercrime

"Only when the tide goes out do you discover who's been swimming naked"

Warren Buffett - legendary US Investor & Philanthropist¹

The types of fraudulent schemes appear limitless and ever-changing and affect every type of financial activity across the entire world. They do, however, share a certain commonality in that the fraudster usually induces the victim to depart with their property, often in the form of money, by false representations of material facts. As the Warren Buffett quote above suggests, in good times, many abuses, including Frauds remain hidden, but in challenging economic periods many Frauds become apparent as investors look for the return of their monies or property.

Harms

While usually carried out without actual or threatened violence, Fraud undermines the integrity of both Commerce and Markets, generating significant criminal proceeds for the criminals involved. With the evolution of the Internet, fraudsters can now reach millions of potential victims quickly and at minimal cost, thus coining the term Internet Fraud.

Fraudulent schemes perpetrated against individuals or groups, particularly vulnerable groups like seniors, or particular markets can ultimately have a devastating impact on those defrauded and the viability and operation of the markets affected. Individuals who fall victim to fraud can experience physical, psychological, financial and social damage. The impact of fraud can also be detrimental for corporate victims. Small/medium sized companies are sometimes unable to recover from the financial or reputational damage caused. Large multinational organisations can feel the effects through the increased cost of doing business. Where the government is victimised, it may pass on its losses to the public such as increased taxes or reduction in services.

Statistics

According to the Association of Certified Fraud Examiners in the US fraud costs US organisations more than US\$400bio each year, with the median loss caused by men, who commit 75% of the offenses, being US\$185,000; the median loss caused by women is US\$48,000. Losses caused by managers are four times bigger than those caused by employees. The median losses caused by executives are 16 times the size of those caused by employees.² Fraud schemes can be very difficult to detect. The median length of the schemes from inception to discovery was 18 months. The median recovery among victim organisations was only 20% of the original loss. Almost 40% of victims recovered nothing at all. Most occupational fraudsters are first time offenders. Less than 8% of the fraudsters had a previous conviction for a fraud-related offense. The most common occupational frauds in small businesses involved: employees fraudulently writing company cheques, skimming revenues or processing fraudulent invoices.

The UK National Fraud Authority estimates that in 2010, Fraud cost the UK £38.4bio.³ There are many types of Financial Fraud schemes. It has been estimated that securities fraud totals approximately US\$40bio per year in the US. In the UK, the FSA estimates the cost of Boiler Room Fraud to be £200mio per year.⁴

Based on the US and UK figures for fraud losses, total global losses if following similar patterns would amount to approx US\$2.75 trillion or between US\$2.3-3 trillion.

"Frauds by country"

According to the UN which ranked countries in order of size per GDP versus the amount of Fraud found that the leader board was dominated by countries with large successful economies, with Germany topping the list, followed by the US and then the UK.⁵

Frauds by Country			
1	Germany	11	Italy
2	US	12	Japan
3	UK	13	India
4	France	14	Sweden
5	Korea, South	15	Austria
6	Poland	16	Czech Republic
7	Canada	17	Hungary
8	Russia	18	Netherlands
9	Mexico	19	New Zealand
10	South Africa	20	Finland

Source: "Frauds by country", The Eighth UN Survey on Crime Trends and the Operations of Criminal Justice Systems (2002) (UNODC)

According to US General Keith Alexander, Director of the National Security Agency and Commander of US Cyber Command, cyber attacks and cyber crime amount to "the greatest transfer of wealth in history". Putting figures on cyber crime and losses due to cyber attacks is difficult though two figures are often quoted, the first from Symantec, a software security group that intellectual property theft costs US companies US\$250bio a year and a figure from McAfee, a rival firm, that cyber crime globally costs US\$1 trillion a year. General Alexander has used in his remarks the former figure and President Obama has mentioned the latter though little direct evidence has been put forward

to back up these figures.

McAfee has recently revised their US\$1bio estimate, following a study by the Center for Strategic and International Studies (CSIS) and sponsored by McAfee, which concluded cybercrime caused a loss to the global economy of between US\$100bio and US\$500bio, with the estimated loss due to cybercrime and cyber espionage for the US economy of US\$100bio.⁶

Definition / Description

Fraud is essentially theft carried out by deceptive means and usually without the use or threat of violence but by manipulative techniques or practices to acquire monies for personal gain. Fraud is not always premeditated, though it often is. It can instead result from losses being incurred and a desire to cover up either the losses themselves or to make up gains by fraudulent activity, with or without personal gain.

Although most countries have their own laws that make Fraud a criminal offense, the severity of the offense and punishment for those who are found guilty vary greatly depending on the country and the type of Fraud committed. The FATF Recommendations designates Fraud as a predicate offence and FATF has published guidance on specific types of fraud, such as their 2007 paper "Laundering the Proceeds of VAT Carousel Fraud".⁷ In their recent update of the FATF Recommendations, FATF added tax crimes to the list of predicate offences for money laundering. This addition will bring the proceeds of Tax Fraud within the scope of the powers and authorities used to investigate money laundering - which are typically far more extensive and intrusive than those used to investigate "ordinary" crime.

Historical Background / Context

The history of fraud goes back millennia and has probably been around since the very early days of commerce. One of the first recorded examples of attempted Fraud involved a Greek merchant named Hegestratos in 300 BC who took out a large insurance policy known as bottomry. Hegestratos borrowed money and agreeing to pay it back with interest when the cargo he was shipping - in this case corn - was delivered. The lender as security for the loan was entitled to acquire the boat and its cargo in case of default. Hegestratos' plan was to sink his empty boat, having secretly off-loaded his corn, thus defrauding the lender of his money, the corn or the boat, but his plan came unstuck when he drowned whilst sinking his boat.

Under Roman law, for example Law 265 stated "if a herdsman to whose care cattle or sheep had been entrusted, be guilty of fraud..." he could be punished by a forfeit of ten times the value of the fraud or in some cases, his life should "be solemnly forfeited," or ended. Nevertheless fraudulent practices were commonplace and rather than punishing offenders the Latin and legal maxim, "Caveat Emptor," or let the Buyer Beware became the watchword largely governing commercial

transactions before more effective legal arrangements began to be developed in English Common Law in the 16th Century onwards..

Fraudulent schemes appear limitless in variety and fraudsters come in all shapes and sizes. Some of the largest recorded have led to great historical events, for example fraudulent activity materially contributed to Tulip Mania, (17th Century) the South Sea and Mississippi Bubbles (18th Century) and to the Florida Real Estate Bubble (20th Century) and more recently extensive mortgage and other Frauds which precipitated the US Housing Bubble which was a major contributor to the recent Financial Crisis. For more details see Insider Dealing below.

Whilst many different individuals were involved in these Frauds, some of the most notable Frauds can be attributed to individuals, particularly those creating and exploiting Ponzi Schemes; (for example the eponymous Charles Ponzi, Ivar Krueger, (20th Century) and only recently, Bernie Madoff and Alan Stanford), to those controlling major Corporate businesses; (for example Ken Lay and Jeffrey Skilling at Enron, Bernie Ebbers at Worldcom, Dennis Kozlowski at Tyco and Calisto Tanzi at Parmalat) where massive Accounting Frauds were perpetrated and to those so called Rogue Traders; (for example Nick Leeson at Barings followed by a host of others, James Jett, at Kidder Peabody, Jerome Kerviel at Soc Gen and more recently Kweku Adoboli at UBS), who placed very large unauthorised trades, which in the end led to major losses at each of the institutions involved and in the case of Barings to the collapse of what was then Britain's oldest Bank.

Money Laundering

The following, whilst certainly not exhaustive, are perhaps the most significant examples of Fraud, both in the sense of their prevalence and persistence and in terms of the size of ultimate losses to investors and to victims, categorised as to the type and nature of the Fraud involved.

Accounting Fraud Schemes

Accounting Fraud typically involves complex methods for misusing or misdirecting funds, overstating revenues, understating expenses, overstating the value of corporate assets or under-reporting the existence of liabilities, sometimes with the cooperation of officials in other corporations or affiliates.

In public companies, this type of "creative accounting" amounts to at least falsifying books and records and often to outright fraud. Such fraudulent conduct may be motivated to avoid a company's stock price from falling so as to generate profits for the high level executives orchestrating the fraud that maintain large amounts of company stock or could be done to avoid reporting instances of self-dealing by high level executives.

Accounting Fraud - Top 10 by losses			
1	<u>Enron</u>	US\$40-45bio	US

10	<u>Satyam</u>	US\$1.5bio	India

Source: Author

notably by those usually on the trading floor within Investment Banks, who have come to become known as **Rogue Traders**. One notable exception that is more like an Accounting Fraud than a pure Rogue Trader incident is the case of Helmut Eisner, then CEO of Austrian Bank, Bawag that made huge losses through fraudulent actions and was nearly forced into Bankruptcy.

Rogue / Unauthorised Trading

Rogue Trading is where employees - usually within Investment Banks - who are authorized to trade on behalf of their employer, but who exceed their authority. Rogue trading generally involves the entry and cancellation of fictitious orders designed to cover trading losses from unauthorised trading. As such, the practice involves multiple violations of securities and/or fraud laws as well as securities regulations. In the US, FINRA has issued guidance (See FINRA Reg. Notice 08-18) on best practices for detecting and preventing rogue trading.

These best practices include: heightened firm scrutiny of red flags such as trading limit breaches, unrealised profit and loss on unsettled transactions, unusual patterns of cancellations and corrections, a pattern of aged fails to deliver; increasing password security and other protections of firm systems and risk management information; and creating a stronger compliance culture within the firm. In the most notorious of cases they end up losing huge sums in the process for their Banks, and in the case of Nick Leeson led to the collapse of one of Britain's oldest banks, Barings Bank.

Rogue Trading - Top 10 by losses			
1	<u>Jerome Kerviel</u> Société Générale	US\$ 7.2bio	France
2	<u>Yasuo Hamanaka</u> Sumitomo Corp	US\$2.62bio	Japan
3	<u>Kweku Adoboli</u> UBS	US\$2.3bio	UK

9	<u>Peter Young</u> DMG	US\$660mio	UK
10	<u>Joseph Jett</u> Kidder Peabody	US\$339mio	US

Source: Author

Whilst each of the rogue trading incidents have their own facts and particular circumstances, they nevertheless appear to have many similarities. For example, all are men, holding senior positions (usually MD or similar) albeit relatively young (average mid 30s when the fraud started). The duration of the fraud is approximately 3 years, with knowledge of back office operations, no evidence of active collusion but some knowledge of irregularities and a distinct absence of effective or close supervision, failing to identify and/or understand significant increases in trading activity, alleged profitability and/or trading exceptions. Motivation is largely towards establishing a stellar reputation and in so doing increasing personal compensation or starting by trying to cover for losses incurred.

The importance of these cases is to do with the huge losses incurred rather than the nature and/or provenance of the fraud. The losses that are generated by the Top 10 cases exceed US\$20bio and losses of this magnitude can hardly be contemplated by traditional forms of fraud or criminality for that matter. The link of course is that it is only as a result of the size of the Securities Markets and the nature of trading that such sums are involved and such losses can result. Beyond the odd Rogue Trader within an Investment Bank where the victim is usually his employer, there lurk plenty of other rogues looking to abuse investors in the securities and other markets, like the commodities markets, engaging in numerous forms of Market Abuse, the main areas of concern being Insider Dealing, Misuse of Information and Market Manipulation. For details see Insider Dealing which includes Misuse of Information below and Market Manipulation which is also set out in this Part 1, Section 1 below.

Hedge Fund / Investment Company Fraud

A Hedge Fund is in essence a managed portfolio of aggressive investments that uses advanced investment strategies such as leveraged, long, short and derivative positions in both domestic and international markets with the goal of reducing volatility and risk while attempting to preserve capital and deliver absolute returns to its investors under all market conditions. They are similar to mutual funds in that investments are pooled and professionally managed, but differ in that the fund has far more flexibility in its investment strategies. Alfred Winslow Jones launched the first Hedge Fund back in 1949. Mr Jones tried to minimize risk in holding long-term stock positions by short selling other stocks and he also engaged in leveraging. As the first money manager to combine short selling, the use of leverage, shared risk through a partnership with other investors and a compensation system based on investment performance, Jones earned his place in investing history as the father of the hedge fund. Since Mr. Jones' founding of the first Hedge Fund, the industry has had its ups and downs but is now running full steam with some estimates claiming over US\$2.3 trillion is managed by Hedge Funds. In most jurisdictions, Hedge Funds are often set up as private investment partnerships that are

open to a limited number of investors and require a very large initial minimum investment. Investments in hedge funds are illiquid as they often require investors keep their money in the fund for at least one year and only allow withdrawals on a quarterly, biannual or annual basis. Hedge Funds are private collective investment vehicles which are active in the global capital markets, seek to achieve absolute returns and capital appreciation. Hedge funds use a variety of investment techniques, are lightly regulated and often accept only a very limited number of investors so as to ensure that their investment strategy remains flexible. Hedge funds are categorized not only according to the asset classes in which they invest (equities, bonds etc.) or their geographic or thematic orientation, but also in terms of their strategies (e.g. arbitrage, macro, event-driven or opportunistic). Hedge Funds are Pooled Investment Vehicles.

The theory behind their creation was that wealthy investors are "financially sophisticated" and therefore do not need as much regulatory protection. It is this absence of regulatory scrutiny that poses risks in dealing with Hedge Funds and which may tempt unscrupulous hedge fund managers to commit fraud and/or tempt the introduction of criminal proceedings. Whilst there have not been many cases of hedge funds being used as vehicles for money laundering or terrorist financing, there have been many instances of hedge fund managers, especially in the past three to five years, accumulating insider information and using it to increase returns on investments and gain an edge in the highly competitive hedge fund industry. In addition, because of the opaque nature and structure of a hedge fund, they have a propensity to be embroiled in Ponzi schemes. Fund managers can easily create an illusion of positive returns and they can easily falsify statements with exaggerated assets under management to investors. In 2011 one of the 'largest hedge fund insider trading cases in US history' came to an end when Galleon hedge fund manager Raj Rajaratnam was convicted of insider trading. He created an intricate system of insiders across the financial industry that he used to access information to benefit his hedge fund. For more information about Insider Dealing and/or Market Manipulation see below. At Daedalus Capital Partners, for example, a classic Advanced Fee scheme was perpetrated by the hedge fund manager; investors received false financial statements claiming large profits, when in fact the money was being siphoned off and used to finance the manager's lavish lifestyle. Another example was the Hedge Fund Group known as the Bayou Funds which was run by Samuel Israel III which also collapsed following Israel's attempts to make money to cover a loss by overtrading, losing still more money and failing to disclose the real state of the Fund until its collapse. Israel nearly further compounded his Investors losses by trying to be the remaining funds on offered Prime Bank Instruments, itself a scam tried out on Israel himself but the trades didn't go through when the custodian Banks refused to move the money and informed the authorities.

Boiler Rooms

Boiler Rooms refer to a busy centre of activity, usually selling speculative, questionable, worthless or non-existent securities traditionally by telephone, where a group of salesmen work using unfair, dishonest high pressure sales tactics or committing outright fraud. The term "Boiler Room" is likely to have originated from the cheap, hastily arranged office space used by such firms, often just a few desks in the basement or utility room of an existing office building or by the high pressure heating appliances or a combination of the two. Whilst many consider boiler rooms a fictional relic of a bygone era, for example many disappeared in the 1990s following the burst of the "dot-com bubble," many boiler rooms still operate across the world. Advances in telecommunication technology mean that a company can viably operate from long distances targeting unsuspecting prospective investors. Also the Internet has led to this medium being abused for securities frauds by mimicking traditional telephone scams, and leveraging the Internet to provide increased anonymity and increased targeting of investors.

Boiler Rooms may also operate in one country while calling prospective investors in another. The advantage of such an operation is that a company can often operate without fear of prosecution from the investor's native legal system. For example, many boiler rooms contacting prospective investors in the UK operate from Spanish cities such as Barcelona and Valencia.

A recent example would be the case of David Mason who was arrested and sentenced to 2.5 years in prison in the UK. Mason organised cold calling to sell shares in a company EduVest which he had set up himself and was worthless, taking £270,000 from 32 investors. Another example of Boiler Room activity was Stratton Oakmont a New York brokerage house founded by Jordan Belfort and Danny Porush that was shut down in the late 1990s, following numerous complaints. The brokerage perpetrated one of the oldest scams in stock market history, the Pump and Dump, buying up large amounts of shares in a thinly-traded company, recruiting hundreds of others to do the same (often not revealing the large ownership stake) in order to raise the stock's market value, and then selling the shares at the inflated price before the other shareholders are aware of the scheme. Belfort was convicted of securities fraud in 1999 and served 22 months of a four-year sentence.

Prime Bank Instruments/Schemes

Investors are induced to invest in financial instruments, allegedly issued by well-known institutions, which offer risk-free opportunities for high rates of return; benefits which are allegedly the result of the perpetrator's access to a secret worldwide exchange ordinarily open only to the world's largest financial institutions. Prime Bank Instruments or Guarantees are bogus instruments and a form of High Yield Investment Fraud, which themselves take many forms, but are all characterized by offers of

low or no risk investments that guarantee unusually high rates of return. They also include Ponzi Schemes.

Investment Frauds

Investment / Ponzi Schemes

Named after its early 20th century creator, Charles Ponzi, these schemes use money collected from new 'investors' (i.e., victims), rather than profits from the purported underlying business venture, to pay the high rates of return promised to earlier victims. This arrangement gives victims the impression that there is a legitimate, money-making enterprise behind the perpetrator's story when, in reality, victim monies are the only source of funding. Classic major investment fraud schemes often rely on attracting investors based on false promises/representations of high rates of returns on investments. The more significant cases often involve people that, until the unraveling of the fraud, are projected as successful prominent businessmen. For example, Bernie Madoff, who orchestrated the largest ever Ponzi scheme, ran his own US registered broker dealer and Investment Advisory firms, and had served as Chairman to the Board of Directors and on the Board of Governors to NASDAQ, a Self Regulatory securities industry organisation. Similarly, Alan Stanford, ran his own banks and had been knighted by Antigua and Barbuda. The fraudsters who orchestrate an Investment Scheme often illegally use investor funds for their own personal benefit to purchase luxury items and project a high style of living. This in turn is often used to attract other investors. In reality their "success" is illusory, the investments are either never made or simply never perform to the represented returns. The fraud is usually perpetrated by providing false statements to customers. Outside of Bernie Madoff, which involved a classic Ponzi scheme that was furthered by providing his clients false returns on investments purportedly made in the stock market, more often the investments are less transparent, such as promissory notes, or other securities created by the fraudster. In such schemes, the activity flowing through a financial institution will show an inflow of funds from the investors and an outflow to different investors. The fraudster may use multiple accounts and different institutions to further conceal the fraud. For more details and case examples see, Charles Ponzi, Ivar Krueger, Bernie Madoff and Alan Sanford.

Some Investment or Ponzi schemes revolve around a specific product, that while legal, is susceptible to fraud if unregistered or less transparent, such as Promissory Notes; overly complex, such as Securitized Life Settlement Contracts; marketed as being mysterious or for special investors, such as Gold and Precious Metals or energy Investments; or preys on the desperate, such as Distress Real Estate schemes. Other schemes, referred to as Affinity Fraud, may target a particular group of people who are similar to, or have something in common with, the fraudster, as was the case with Bernie Madoff.

Ponzi Schemes - Top 10 by losses			
1	Bernie Madoff	US\$10-17bio	US
2	MMM Company	US\$10bio	Russia
3	R Allen Stanford	US\$8bio	US / Antigua
4	Tom Petters	US\$3.75bio	US
5	Scott W Rothstein	US\$1.4bio	US
6	Albania Lottery Scheme	US\$1.2bio	Albania
7	Damara Bertges & Hans Gunther Spachtholz	US\$1.1bio	Germany & Switzerland
8	Caritas (Charity)	US\$667mio	Romania
9	Reed Slatkins	US\$593mio	US
10	Gerald Payne	US\$500mio	US

Source: Author

The Pyramid Scheme

As in Ponzi Schemes, the money collected from newer victims of the fraud is paid to earlier victims to provide a veneer of legitimacy. In Pyramid Schemes, however, the victims themselves are induced to recruit further victims through the payment of recruitment commissions.

Nigerian Letter (419) /Advance Fee/Lottery Frauds

This category of fraud encompasses a broad variety of schemes which are designed to induce their victims into remitting up-front payments in exchange for the promise of goods, services, and/or prizes. These fraudulent schemes are typically not sophisticated and the victim is induced to send funds in return for a promise of larger return.

Advance Fee Fraud

In a typical Advance Fee Fraud the fraudster solicits their victim through unsolicited means (Internet, mail) indicating that they have funds due to them (lottery, inheritance) and must send their own funds in order to claim/release these winnings. Prosecutions of such crimes are infrequent given the logistical challenges of tracing the fraudsters who often operate outside of the jurisdiction of the victim. The impact of such schemes are nonetheless devastating to the victims who can lose significant assets and in some instances their life savings. The crimes are likely under-reported given the victim's humiliation at falling prey to such schemes. Because these schemes pose a low risk of prosecution while also generating significant proceeds, they are utilised by certain criminal organisations in Africa, and in particular Nigeria where they are known as '419 letters' after the section of the Nigerian Penal Code referring to such crimes. A fraudster who employed Advance Fee Fraud

techniques and who currently sits in an Indian jail and is the subject of a major probe is [Hassan Ali Khan](#). Perhaps the most successful case using some of these techniques is the case of [Chief Nwude](#) who was able to steal US\$242mio from Brazilian Bank Noroeste. For more details see also Part 2, Section 5, Nigerian Crime Gangs.

Some of the most prevalent Advance Fee Fraud schemes being encountered include the following:

Disaster Fraud

When a disaster occurs, there are many organisations and individuals soliciting contributions for the victims of this disaster. Most of the organisations and individuals involved are legitimate; however, there are some who are not. Victims may be approached by unsolicited e-mails asking for donations to a legitimate-sounding organisation. The schemer will instruct the victim to send a donation via a money transfer. Other types of disaster fraud include false or exaggerated claims by policyholders; misclassification of flood damage as wind, fire, or theft; claims filed by individuals residing hundreds of miles outside the disaster zone; bid-rigging by contractors; falsely inflating the cost of repairs; and contractors requiring up-front payment for services, then failing to perform the agreed upon repairs

Foreign Lottery Fraud

Victims are informed they have won a substantial prize in a foreign lottery usually by e-mail, but before they can collect or receive the winnings they must first make some payments for example to cover taxes or other fees. Alternatively, victims are provided with counterfeit financial instruments, which can be cashed only by first paying a fee.

Overpayment Fraud

Victims who have advertised an item for sale are contacted by bogus buyers who remit counterfeit financial instruments, in excess of the purchase price, for payment. The victims are told to cash the instruments, often a cheque, but first send the difference between the price of the goods and the overpayment to the buyer, often by wire so that the victim's payment clears before the fraudulent instrument is determined to be bogus..

Recovery Schemes

Victims that have already succumbed and lost money are seen as particularly vulnerable and attempts are often made to reconnect with the victim to try to defraud him even further, often by trying the Recovery Scheme. The Victim is contacted by people posing as police officers, government employees, or lawyers informing victims that the persons responsible for the original fraud schemes have been arrested or successfully sued and their bank accounts have been seized. The victim is told the seized money is going to be returned to him, but the victim must first pay fees for processing and administrative services. Recovery schemes often target victims many months or years after the original fraud schemes.

Banking/Payment Card Fraud

This is a generic term used to describe a range of offences involving theft and the fraudulent use of accounts payment and card account data. Frequent types of banking fraud and payment card fraud include:

PB Fraud/Broker Embezzlement

As with Rogue Traders in Investment Banks, Client Advisers in Private Banking operations have been known to act outside of their authority, for example by acting either on a discretionary basis or on a purely fraudulent basis, by trying to cover unauthorized losses or by trying to defraud a client or clients of their own assets. An example of one that began as the former and turned into the latter is the case of [Hans Peter Walder](#), a private banker with access to client funds.

There are other similar frauds that arise out of relationships where there should exist a high level of trust, for example by trustees or lawyers and/or bookkeepers. Kenneth Starr is a good example. He was a former CPA and attorney convicted of running a US\$30mio Fraud scheme with the money of numerous wealthy and celebrity clients. In May 2010, Starr was indicted and arrested on 23 criminal counts, including various fraud and money laundering charges. In September 2010, Starr pleaded guilty in federal court and was sentenced in March 2011 to a 7.5-year prison term that he is currently serving and is due to be released in 2016. Starr initially made large amounts of money for clients, but he eventually began using client assets to fund his personal expenses, as well as high-risk investments in which he and his associates had financial interests. As his personal expenses increased and various high-risk investments failed, Starr began stealing funds from older clients and using subsequent investment from new clients to cover up the prior thefts. One of those clients was 93-year-old former actress Joan Stanton, after obtaining a power of attorney over her assets, Starr then depleted her funds and was subsequently sued by her in civil court in April 2008. After Stanton died in 2009, Stanton's daughter launched a federal criminal investigation of Starr, which led to the uncovering of his multi-million dollar Fraud. In these cases the fraudster has access to the funds through their fiduciary relationship with the victim.

Credit & Debit Card Fraud (incl Counterfeit Cards)

Credit card fraud is the illegal obtaining of goods or services, or to obtain unauthorised funds from an account by using another persons credit card or any similar payment mechanism (for example, debit cards, store cards, etc.) as a fraudulent source of funds in transaction. This can be done by creating a copy of a card, 'skimming' the details during a routine transaction, stealing a card or intercepting it in the post and many other creative ruses. Credit card fraud is often committed in addition to identity theft. Counterfeit card fraud is undertaken using plastic cards that have been specifically produced or existing cards that have been altered. These cards are encoded with illegally obtained payment

card account data in order to pay for goods and services or to withdraw cash. Card not present (CNP) fraud is committed using payment card account data to undertake transactions where there is no face-to-face contact between the seller and purchaser. Typically, this type of fraud is committed over the Internet, by mail order or telephone. CNP fraud is currently one of the fastest growing payment card related types of fraud.

Cheque Kiting

Cheque Kiting is a cheque fraud scheme taking advantage of the float time (the bank's delay in the clearing process between receipt of deposits and cheques and their processing) to defraud banks by writing cheques against accounts with insufficient funds to cover the cheque. This is been done by writing a cheque to the criminal from one bank and depositing and even crediting it to an account at another bank. The account with the credited cheque shows then a positive balance, which enables the criminal to withdraw enough money to deposit back into the first bank before the cheque bounces for lack of funds. Banks should use an electronic receipt system to reduce the float time by instantly recording and processing cash transactions

Identity Theft / Bank Account Takeover

Identify theft is the stealing of a person's financial or personal information, especially credit cards and Social Security numbers or other identification numbers or data often through Phishing or Pharming techniques, with the intention of using that data to commit fraud and create a duplicate persona. There are some methods that involve accessing a person's computer and obtaining passwords and access information or using some of the weaknesses in the Internet often in an effort to "take-over" a bank account or access other financial accounts. Others involve attacking corporate computer and database systems to get access to the information that they hold on customers, such as bank account information or even social applications like Twitter that sometimes copy and store customer information without their knowledge (e.g. smart phone contacts.)

Mortgage and Other Credit / Loan Frauds

Mortgage Fraud and/or Loan Fraud schemes employ some type of material misstatement, misrepresentation, or omission relating to a real estate transaction in the case of a mortgage or a credit transaction in the case of a loan. The most common misrepresentation relates to overstating income and asset information on a loan application. Whilst the perpetrator of the Fraud is usually the borrower, there are cases where one or more industry insiders or professional parties assist using their specialized knowledge or authority to commit or facilitate the fraud. For example, in the case of real estate mortgage fraud, particularly systemic frauds, it is not surprising to find collusion by bank officers, appraisers, mortgage brokers, lawyers, loan originators, and other professionals engaged in the industry. Fraud for housing typically represents illegal actions conducted solely by

the borrower, who is motivated to acquire and maintain ownership of a house under false pretenses such as misrepresented income and asset information on a loan application.

Trade Based Money Laundering

One of the 3 primary methods used by criminals to move criminal money involves trading goods, alongside moving cash and other valuables outside the formal financial sector and cash and other valuables inside the formal financial sector. These methods can also be used in various combinations.

The method involving goods is known as “trade-based money laundering.” It involves the transfer of “value” via commodities and trade goods, either to avoid customs and excise or other duties or taxes or otherwise minimizing taxable income or to provide a “counter-valuation” or a way of balancing the books in many global underground financial systems. It is also a mechanism to enable capital flight or foreign inward investment.

The Financial Action Task Force (FATF) defines trade-based money laundering (TBML) as the “process of disguising the proceeds of crime and moving value through the use of trade transactions in an attempt to legitimize their illicit origins.” Trade-based money laundering techniques take a wide variety of forms.

For example, at its most basic it could be a simple bartering or a commodity for commodity exchange. In certain parts of Afghanistan and Pakistan the going rate for a kilo of heroin is a color television set. Drug warlords exchange one commodity they control (opium) for others that they desire (luxury and sports utility vehicles). More sophisticated however is the manipulation of goods traded, particularly goods destined for overseas buyers.

It is important to understand that when a buyer and seller are working together, the price of any good can be whatever they want it to be and so simple invoice fraud is an easy and effective way of money laundering.

Under Invoicing/Over Invoicing

Simple invoice fraud and manipulation involves the misrepresentation of the trade good in order to transfer value between an importer and an exporter. The quantity, quality, and description of the trade goods can be manipulated. The shipment of the actual goods and the accompanying documentation provide cover for “payment” or the transfer of money. So for example to move money out: Import goods at overvalued prices or export goods at undervalued prices; and to move money in: Import goods at undervalued prices or export goods at overvalued prices. As long as parties in an international trade transaction do not get too aggressive or greedy and cause noticeable trade anomalies, their chances of detection by customs services, law enforcement and other authorities appear low.

According to the US State Department, this practice has reached “staggering” proportions in recent years. The US Department of Treasury estimates that the [Black Market Peso Exchange](#), a Trade Based Money Laundering methodology found in the Western hemisphere, launders billions of drug dollars every year. For more details see Part 1: Section 1 Drug Trafficking.

Other Countries particularly effected include Brazil, Russia, India and China. According to Global Financial Integrity (GFI), a Washington, DC-based research and advocacy organisation, in its study, entitled “Russia: Illicit Financial Flows and the Role of the Underground Economy,” it estimated that the Russian economy lost US\$211.5bio in illicit financial outflows from 1994 through to 2011, whilst at the same time received illicit inflows to the Russian economy of US\$552.9bio over the same time period.

A similar study published by the Institute on China estimated that US\$3.79 trillion in illicit financial outflows occurred from the Chinese economy from 2000 through 2011. (“Illicit Financial Flows from China and the Role of Trade Misinvoicing.”) GFI Director Raymond Baker stated that “There’s no other developing or emerging economy that even comes close to suffering as much in illicit financial outflows.”

The research found that the illegal outflows, the proceeds of crime, corruption, and tax evasion were largely due to a trade-based money laundering technique known as ‘trade misinvoicing,’ which accounted for US\$3.2 trillion, or 86.2%, of the total outflow of illegal capital over the 11 years studied. The research found that there had been a sharp increase in annual illicit financial outflows, increasing from US\$172.6bio in 2000 to US\$602.9bio in 2011.⁸

Countering Trade Based Money Laundering

Whilst detection rates considered historically low, increased attention to countermeasures have been considered and there is cause to believe that detection rates should improve in the near future. Every country has a customs service and tracks what comes in and what goes out.

In fact, in many parts of the world, customs duties are the primary source of government revenue. So although there are differences in the way governments gather and store trade data, enough similarities exist to conduct effective analysis and TBML investigations. Such investigations require three basic elements: (i) Access to import and export data; (ii) the ability to exchange data with other countries; and (iii) expertise in analyzing and investigating TBML.

Recognising the growing threat of TBML, in 2004 the Department of Homeland Security’s Immigration and Customs Enforcement (ICE) established the world’s first trade-transparency unit or TTU. Subsequently,

other TTUs have been created in Argentina, Brazil, Paraguay, Colombia, Panama, Mexico and other countries. By comparing one country’s imports or exports against the corresponding data of another country, trade anomalies can be detected that could be indicative of customs fraud, tax evasion and capital flight contraband smuggling or trade-based money laundering. This data could even be the back door into underground financial systems.

For example, a TTU looked at import and export data between two countries, and may identified that fluctuating values were associated with the values ascribed to refrigerators exported from one country to another. Whilst refrigerators were exported from Country A largely at one value, their value declared on import in Country B was much greater. In this case, the value transfer represented by the shipments of refrigerators masked the laundering of the proceeds of narcotics.

Tax Evasion/Tax Fraud

Tax evasion is the general term for efforts by individuals, corporations, trusts and other entities to evade taxes by illegal means. Tax evasion usually entails taxpayers deliberately misrepresenting or concealing the true state of their affairs to the tax authorities to reduce their tax liability and includes in particular dishonest tax reporting, such as declaring less income, profits or gains than actually earned or overstating deductions.

Tax evasion is an activity commonly associated with the informal economy and one measure of the extent of tax evasion is the amount of unreported income, namely the difference between the amount of income that should legally be reported to the tax authorities and the actual amount reported, which is also sometimes referred to as the tax gap.

In the US, the IRS estimate of the 2000 tax gap was US\$385bio.⁹ A more recent private study estimated the tax gap as US\$500bio.¹⁰ Therefore, 18-19% of total reportable income is not properly reported to the IRS, it is estimated that global tax evasion could amount to 5% of the global economy. Aside from figures, that relate to tax evasion or abusive tax avoidance where for example, the European Commission has reported in 2012 that tax evasion activities within the 27 nation EU amounted to a loss of US\$1.3 trillion.¹¹

Tax fraud is an even more serious crime, usually involving organised criminal gangs, targeting tax laws to generate significant criminal proceeds. The largest tax fraud market is that which focussed on EU VAT Fraud. Those who perpetrate VAT fraud, are becoming increasingly sophisticated in their methodologies.

Currently, organised criminal groups, based both within and outside the EU, are orchestrating large scale attacks on EU Member States’ exchequers by carefully monitoring “the market” for further opportunities offered by diverse commodities or deregulation of certain mar-

kets, such as the gas and electricity sectors. Organised criminal groups almost routinely employ the knowledge of specialised facilitators and mechanisms, frequently situated outside the EU, to mask their fraudulent activities, take advantage of loopholes in legislation governing financial practices and ultimately trawl the plethora of schemes and safe havens available to launder the proceeds of their crimes. VAT fraud alone in the EU costs Member States approximately €100bio a year, according to Europol.

MTIC/Carousel Fraud

Cross-border transactions within the EU have, since 1992, been zero-rated for VAT. Importers of goods are thus able to receive goods without paying VAT, but charge VAT on their resale. If the VAT they receive is not then remitted to the revenue authority, they are committing a crime. This crime is known as “Missing Trader Inter Community Fraud.”

The schemes are based on either virtual or real ‘carousel’ transactions where the same ‘goods’ are sold and resold several times. This is commonly referred to as VAT “Carousel Fraud.”

Attempts to undertake this fraud have risen considerably in the past decade, largely due to the proliferation of high value and low weight goods, or service industries, usually with few barriers to entry such as mobile phones and computer chip, although the subject of the fraud has diversified for example with cosmetics, “precious” metals and computer Software being targeted by criminals.

The basic model of transnational intra-community VAT fraud involves at least two Member States. MTIC is carried out by organised criminals who put in place a structure of linked companies and individuals whilst at the same time exploiting the different particularities of national tax systems to disguise the real links between participants. Those involved in VAT fraud schemes, who are initially responsible for the tax damage, the so-called missing traders only operate for a short time, sometimes only weeks, before disappearing.

Whilst this is a fraud against the fiscal authorities of the EU Member States, cross-border, or transnational, VAT fraud not only affects the economic and financial interests of the EU but also has an impact on lawful businesses which in turn may have a negative impact on employment levels. Moreover, the profits from VAT fraud may finance other types of criminal activity, for example cigarette smuggling or drug trafficking.

Major VAT fraud has been detected in the trading of emission allowances or European unit allowances (EUAs). Europol estimates that the loss to carbon credit fraud between June 2008 and December 2009 was approximately €5bio.¹²

Cybercrime

In a world awash with information, cyberspace is a new frontline in the war on crime. Already one third of the world's population has access to the internet, and with this comes growing cybercrime. A recent study from Ponemon Institute has found that the average cost related to cybercrime for 50 US companies was US\$5.9mio per year. This represents an increase of 56% from the first cyber cost study published in 2010. It took an average of 14 days and US\$247,744 to clean up an attack in 2010. In 2011, with a jump in stealth tactics, that average increased to 18 days, and the cost climbed to US\$417,748. More than 90% of all cybercrime costs were caused by malicious code, denial of service, stolen devices and web-based attacks.¹³

Cybercrimes can be defined as offences that are committed against individuals or groups of individuals with a criminal motive to intentionally harm the reputation of the victim or cause physical financial or mental harm to the victim directly or indirectly, using modern telecommunication networks such as Internet (Chat rooms, e-mails, notice boards and groups) and mobile phones (SMS/MMS)".

As far as computers go cybercrime encompasses a broad range of activities. Generally, however, it may be divided into two categories: (i) crimes that target computers directly; (ii) crimes facilitated by computer networks or devices, the primary target of which is independent of the network or device. Crimes that primarily target computer networks or devices include: Computer viruses; Denial-of-service attacks; Malware (malicious code) whilst crimes that use computer networks or devices to advance other ends include: cyberstalking; Fraud and identity theft; Information warfare; and Phishing scams and of course Spam, (or the unsolicited sending of bulk e-mail for commercial purposes, which is unlawful in some jurisdictions).

Cybercrime is not only targeted at companies, governments and other public institutions or simply on or via computer devices. 69% of online adults have been a victim of cybercrime in their lifetime. Of these, 10% have experienced cybercrime on their mobile phone and 42% more mobile vulnerabilities were reported in 2010 compared to 2009, a sign that cybercriminals are starting to focus their efforts on the mobile space. In addition to threats on mobile devices, increased social networking and a lack of protection are likely to be some of the main culprits behind the growing number of cybercrime victims.¹⁴ According to SANS Technology Institute¹⁵ one of the biggest 2011-2012 security issue seems to be apps with spyware. Even the apps that come loaded on your phone are potentially a problem. The security issue is that your smartphone knows where you are, has access to your e-mail, appointments, phone contacts, and is part of the way you surf the web, make purchases, access your bank account, yet has very little security or privacy built into it.

Cybercrime includes threats from both cyber spies and cyber criminals as well as activists and pranksters. The cyber threat has evolved and grown significantly over the past decade. Cyber spies, criminals and hackers have become increasingly adept at exploiting weaknesses in computer networks and mobile systems.

Cyber Terrorism

Government officials and Information Technology security specialists have documented a significant increase in Internet problems and server scans since early 2001. But there is a growing concern that such intrusions are part of an organised effort by cyberterrorists, foreign intelligence services, or other groups to map potential security holes in critical systems. The US Department of Defence (DoD) notes that cyberspace has emerged as a national-level concern through several recent events of geo-strategic significance. Among those are included the attack on Estonia's infrastructure in 2007, allegedly by Russian hackers. The DoD stated that, "In August 2008, Russia again allegedly conducted cyber attacks, this time in a coordinated and synchronized kinetic and non-kinetic campaign against the country of Georgia. Fearing that such attacks may become the norm in future warfare among nation-states, the concept of cyberspace operations impacts and will be adapted by war-fighting military commanders in the future."

Organised Crime

Beyond cyber terrorism are hackers-for-profit, who do not seek information for political power, rather they seek information for sale to the highest bidder. These once-isolated hackers have joined forces to create criminal syndicates or to work directly with organised criminal gangs. Operating in cyber space appears to offer good profits with a lower probability of being identified and prosecuted.

For example, Drug traffickers are increasingly taking advantage of the Internet to sell their illegal substances through encrypted e-mail and other Internet technology. Some drug traffickers arrange deals at internet cafes, use courier Web sites to track illegal packages of pills, and swap recipes for amphetamines in restricted-access chat rooms. The rise in Internet drug trades could also be attributed to the lack of face-to-face communication. These virtual exchanges allow more intimidated individuals to more comfortably purchase illegal drugs.

Organised criminal gangs are also involved in cyber extortion, where a website, e-mail server, or computer system is subjected to repeated denial of service or other attacks by malicious hackers, who demand money in return for promising to stop the attacks. According to the Federal Bureau of Investigation, cyberextortionists are increasingly attacking corporate websites and networks, crippling their ability to operate and demanding payments to restore their service. More than 20 cases are reported each month to the FBI but many

more go unreported in order to avoid publicity.

The following are recent examples of criminal activity identified and shut down by law enforcement.

In April 2011, the Coreflood botnet was identified and finally dismantled. This botnet infected an estimated two million computers with malware that enabled hackers to seize control of the privately owned computers, to steal personal and financial information. Botnets are networks of virus-infected computers controlled remotely by an attacker. They can be used to steal funds, hijack identities, and commit other crimes. The botnet in this case involved a virus with a key-logging programme that allowed cybercriminals to steal personal and financial information by recording unsuspecting users' every keystroke

More recently a criminal network operated by an Estonian company called Rove Digital were caught manipulating Internet "click" advertising. They redirected users from legitimate advertising sites to their own advertisements and generated more than US\$14mio in illegal fees. This "click" scheme impacted more than 100 countries and infected four million computers.

One of the most audacious cybercrimes was committed in 2008 when an organised group of criminals, using cloned or stolen credit and debit cards and PIN's to go with them, hit more than 2,100 ATMs in at least 280 cities on three continents, in such countries as the U.S., Canada, Italy, Hong Kong, Japan, Estonia, Russia, and the Ukraine at the same time! When it was all over in only 12 hours, the criminals had stolen US\$9mio in cash, which would have been more, had the targeted ATMs not been drained of all their money.

The masterminds of this scheme were three 20-something Eastern Europeans and an unnamed person called simply "Hacker 3." Working together, the four hackers hatched "perhaps the most sophisticated and organised computer fraud attack ever conducted," according to Acting US Attorney Sally Quillian Yates of the Northern District of Georgia. It started when a 28-year-old Moldovan man learned of a vulnerability in the computer network of a major credit card processing company based in Atlanta. With an eye toward exploiting it, he passed that information to a hacker living in Estonia. The Estonian conducted "reconnaissance" on the network vulnerability and shared what he learned with a hacker in Russia. With the help of the three other hackers at varying times, the Russian was able to break into the electronic network, reverse-engineer the PIN codes from the encrypted system, and raised the limits on the amount of money that could be withdrawn from the prepaid payroll debit cards. (These cards, used by many companies, enable employees to withdraw their salaries from an ATM.) In addition to providing computer support, Hacker 3 managed the network of thieves around the world, called "cashers" who used a total of 44 counterfeit cards to withdraw the US\$9mio.

The Estonian also managed his own cashing group. As the cashers went to work, the Russian took the lead in monitoring the victim company's database to track the illegal withdrawals. With the Estonian, he later deleted or tried to delete files on the computer network to cover their tracks. When the ATM thefts were complete, Hacker 3 with the help of the Estonian gathered and divvied up the proceeds. The cashers got to keep 30 to 50% of the money they stole; the rest went to the four hackers.

Another example of cyber criminal activity was when a group of cyber criminals established a forum on the Internet called "Dark Market," where they bought and sold stolen financial information such as credit card data, login credentials (user names and passwords), and even electronic equipment for carrying out financial crimes. At its peak, this vast criminal network had over 2,500 registered members. Dark Market was like an exclusive club for cybercriminals a meeting place for getting cyber criminal advice and arranging deals. The Market was taken down after being infiltrated by law enforcement.

Cybercrime appears to be the fastest growing sector of organised crime activity with growth rates in excess of 25% annually. Industry as well as computing has always had its clusters, locations where expertise is found and where others co locate to contribute and leverage. In the area of cybercrime, clusters have also developed and the leading countries where such criminals reside and operate are Brazil, Russia and its former soviet republics and China, with India catching up. These countries have something in common which is attractive to the cybercriminals, which allow them a certain expertise and some freedom to more easily operate than in some other locations. These are, (i) high levels of poverty and unemployment; (ii) a high standard of basic education; and (iii) a significant presence already of organised criminal gangs.

Whilst the largest threat appears to come from Russia, according to Group IB in their report entitled, " State and Trend of the Russian Digital Crime Market"¹⁶ they found that whilst the global market was worth some US\$12.5bio, the Russian's controlled around US\$4.5bio of the total. The largest type of Russian cybercrime was online fraud valued at US\$942mio, followed by spam at US\$830mio; C2C (including services for anonymisation and sale of traffic, so called exploits, malware and loaders) at US\$230mio and denial of service attacks at US\$130mio.

According to the UK National Audit Office, most recent figures put the cost to the UK economy for example of losses from and costs to prevent cybercrime amounted to between £18-27bio.¹⁷

Human Trafficking

"I was 14 and they took me and my cousin - they poured petrol over her and burnt her and made me watch her die. I was made to look after a little boy about six and he cried for his parents but I had to tell him he would not see them again". This was the testimony of a girl made to a Mexican NGO in 2010 who was forced into prostitution

Harms

Human trafficking is a form of modern-day slavery where people profit from the control and exploitation of others. Many victims of human trafficking are forced to work in prostitution or the sex industry. But trafficking also occurs in forms of labour exploitation, such as domestic servitude, restaurant work, janitorial work, sweatshop factory work and migrant agricultural work. Apart from the long-term physical & psychological damage that may occur to the individuals and families involved in human trafficking, there are other harms that are less obvious. Consumers that utilise these services are supporting the traffickers and allowing their criminal enterprises to continue to expand. Trafficking of humans is the third largest criminal industry in the world, and, according to some, the fastest growing.

Statistics

According to the UNODC 2006 report on global patterns of human trafficking, governments reported human trafficking originating from 127 countries and exploited in 137 countries worldwide from 1996 to 2003.¹ According to the UN Trafficking in Persons Report 2010² around 12.3 million adults and children are forced into slavery via forced labour, bonded labour and prostitution around the world. It is estimated on this basis that today there are more slaves on the planet than at any other time in History. The ILO has assessed that at least 12.3 million people worldwide are victims of forced labour, with the UN assessing that around 2.5 million of these are as a result of human trafficking. Other estimates from the US Agency for International Development (USAID) for example put the figures even higher, with it estimated that up to four million women, children and men are trafficked each year.

The UN Office on Drugs and Crime considers people trafficking as the fastest growing means by which people are enslaved, the fastest growing international crime, and one of the largest sources of income for organised crime. Trafficking is a multi-billion dollar business, and by its very disguised and hidden nature the precise statistics on trafficking are very difficult to estimate. The Council of Europe have made clear that;

"People trafficking has reached epidemic proportions over the past decade, with a global annual market of about US\$42.5bio." The International Organisation for Migration (IMO) has put the majority of trafficking victims as between 18 and 24 years of age, with UNICEF estimating that around 1.2 million children are being trafficked each year for purposes of sexual exploitation. Of those victims used for forced sexual exploitation it is estimated by the International Labour Organisation (ILO) that 98% are women and girls. Women and girls trafficked for labour exploitation also frequently encounter and endure sexual violence, with estimates that 95% of victims experience physical or sexual violence during trafficking.

Common abuses experienced by trafficked persons include rape, torture, debt bondage, unlawful confinement, and threats against their family or other persons close to them as well as other forms of physical, sexual and psychological violence. The International Labour organisation (ILO) estimates that criminal networks generate revenues of US\$32bio per year with the "human being as a commodity". According to the ILO, half of this profit is made in industrialised countries (US\$15.5bio) and close to one-third in Asia (US\$9.7bio).³

Proceeds of Human Trafficking		
1	Prostitution	US\$187bio
2	Human Trafficking	US\$32bio
3	Human Smuggling	US\$20bio
4	International Adoptions	US\$1.3bio
5	Organ Trafficking	US\$75mio
Estimated Total		US\$240bio

Definition / Description

Human trafficking is the illegal trade of human beings for the purposes of commercial sexual exploitation, including prostitution and child sexual exploitation, forced labour and organ removal. Human Trafficking is one of the fastest growing and most insidious and harmful criminal industries in the world, controlled largely by organised crime and amounting to a modern-day form of slavery. Traffickers use various techniques to instill fear in victims and to keep them enslaved. Some traffickers keep their victims under lock and key. However, the more frequent practice is to use less obvious techniques including: debt bondage - financial obligations, honor-bound to satisfy debt; isolation from the public - limiting contact with outsiders and making sure that any contact is monitored or superficial in

nature; isolation from family members and members of their ethnic and religious community; confiscation of passports, visas and/or identification documents; use or threat of violence toward victims and/or families of victims; the threat of shaming victims by exposing circumstances to family; telling victims they will be imprisoned or deported for immigration violations if they contact authorities; control of the victim's money, e.g., holding their money for "safe-keeping".

Historical Background / Context

From the ancient Greek and Romans to the medieval times, and up until today, humans have been subject to various forms of physical and sexual slavery.

Although forms of slavery existed before the 1400, the 1400s marked the start of European slave trading in Africa with the Portuguese transporting people from Africa to Portugal and using them as slaves. In 1562, the British joined in on the slave trade in Africa. The development of plantation colonies increased the volume of the slave trade. Later on throughout the 1600s, other countries became more involved in the European slave trade. These included Spain, North America, Holland, France, Sweden, and Denmark and would remain legal until the 19th Century.

In 1904, the International Agreement for the Suppression of "White Slave Traffic" was signed and put into action. The purpose of this agreement was to protect women, young and old, from being involved in so called "white slave traffic." White slavery referred to forcing a white woman or girl into prostitution. The agreement stands as a moral action against the trafficking of women.

In 1927 and onwards, The League of Nations, founded after WWI, amended the Suppression of White Slave Traffic to "traffic in women and children" so that everyone was included with no discrimination to race. Children of both genders were also recognised as victims of trafficking. In addition, two major studies were conducted, one in the West and one in the East, in an attempt to find out the real status of trafficking in these areas. Factors that were measured included the number of women engaged in prostitution, the demand, and the surrounding environment of the women who were trafficked.

During WWII, Japan had set up a horrifying and outrageous system where women all across Asia were forced into sexual slavery. The women were housed in what were known as "comfort stations." The conditions in these stations were atrocious, with each woman detained in a small cubicle, and received beatings and

other tortures if they were defiant. Because of this, many women ultimately died of disease, malnutrition, exhaustion, suicide, etc. The stations were also surrounded by barbed wire, making escape impossible. The Japanese government set up these stations in hopes of preventing rape crimes in public, prevent the spread of STDs, and to provide comfort for soldiers so they wouldn't tell military secrets.

In 1956, India initiated the Immoral Traffic (Prevention) Act, which persecutes those involved in trafficking. These activities included running brothels, living on earnings from sex work, capturing and imprisoning people into prostitution, etc, building on examples of such laws being enacted around the world. In 1995, the UN held the fourth World Conference to address the issue of trafficking of women. In this meeting, trafficking was actually recognised as an act of violence against women, and the concept of trafficking was further defined. Most importantly, actions to be taken included enforcing conventions on trafficking and human slavery, addressing the factors that encourage trafficking, setting up effective law enforcement and institutions who would work to eliminate trafficking both nationally and internationally, and implementing programmes including educational and rehabilitation institutions to provide for the social, medical, and psychological needs to victims of trafficking.

Notwithstanding increased focus, trafficking appears to be increasing, with many examples, beyond trafficking for sex to also include economic migrants smuggling. In 2008, for example, 57 migrants were illegally smuggled into Thailand. Fifty-seven of these migrants suffocated to death while being transported after being confined in a sea container where the air-conditioning system malfunctioned. There were 67 survivors. The driver ignored protests by the passengers, fearing that the police would be suspicious at checkpoints, and fled the scene when concerns were raised.

Money Laundering

A distinction can be made between people smuggling as a service to those wanting to illegally migrate, and the involuntary trafficking of people. An estimated 90% of people who illegally cross the border between Mexico and the US are believed to have paid a smuggler to lead them across.⁵ Trafficking in human beings, for sexual services, sex trafficking, is not the same as people smuggling. A smuggler will facilitate illegal entry into a country for a fee, but on arrival at their destination, the smuggled person is free; the trafficking victim is coerced in some way. Victims are tricked or lured into being trafficked by false promises, or forced into it. Traffickers use coercive tactics including deception, fraud, intimidation, isolation, physical threats and use of force, debt

bondage or even force-feeding drugs to control their victims. While the majority of victims are women, and sometimes children, other victims include men, women and children forced or conned into manual or cheap labour. Due to the illegal nature of trafficking, the exact extent is unknown.

Smuggling is also reaping huge financial dividends to criminal groups who charge migrants massive fees for their services. Drug-traffickers and other criminal organisations are switching to human cargo to obtain greater profit with less risk. The smuggling of people is a growing global phenomenon and it is not only a transnational crime, but also an enormous violation of human rights and a contemporary form of slavery. Currently, economic instability appears to be the main reason for illegal migration movement throughout the world. Nevertheless, many of the willing migrants undertake the hazardous travel to their destination country with criminal organisations specialized in people smuggling and arrange everything for the migrants, but at a high price. Very often the traveling conditions are inhumane: the migrants are overcrowded in trucks or boats and fatal accidents occur frequently. After their arrival in the destination country, their illegal status puts them at the mercy of their smugglers, which often force the migrants to work for years in the illegal labour market to pay off the debts incurred as a result of their transportation.

A number of recent examples highlighted by the UN and ILO serve to illustrate the horrors of these crimes. Police in Nigeria freed 32 teenage girls from a so called "baby factory" used to feed the region's expanding sex trade and human trafficking markets. The police in the southern Nigerian city of Aba raided the clinic, known as The Cross Foundation, after receiving a tip that the owner was harboring pregnant girls and selling their babies. Some of the girls, who were between 15 and 17, told authorities that the clinic's owner, Dr. Hyacinth Orikara, forced them to sell their babies to him for around US\$190, depending on the gender. The organisations sell newborns to the highest bidder and the children often end up being used as factory workers, mine workers or sex slaves.

In 2005, 5 criminals of Turkish origin were arrested and in 2006 convicted in the UK in relation to illegal smuggling of mainly Turkish migrants, sentenced to lengthy prison sentences and receiving confiscation orders totalling over £25mio. The illegal immigrants were predominantly Turkish and were smuggled into the UK by lorry as well as motor vehicle, trains and light aircrafts. The fee charged per immigrant was believed to be in the region of £3,500 for a channel crossing and up to €14,500 from Turkey across Europe. This money would cover the transport cost, the cost of the documentation, which is needed in the UK, although this documentation was usually false. The money would also cover the cost of accommodation on arrival in the UK. It is estimated that over 20,000 immigrants were smuggled into

the UK by this group of individuals. Interpol have taken a lead particularly in Africa with numerous operations focussing on child labour trafficked in the region. For more details see Part 2, Section 7, Human Trafficking. A case of child sexual exploitation also caught by Interpol in Holland is that of Robert Mikelsons who was identified as part of a paedophile ring.

A large proportion of the funds generated by Human traffickers will be in cash. These criminal proceeds will be used, depending upon the type of trafficking involved to offset expenses incurred in the operation. Cash may be generated in one currency and in one location and expenses incurred in one or more different currencies and/or one or more different countries and so Money Services Businesses may be used by the Human Traffickers. In order to launder the net cash proceeds of human trafficking, cash intensive businesses may be used. In one case in the UK, Turkish Kebab shops were first acquired (for cash) and then used to launder net cash proceeds in the UK. Use of legitimate cash generating businesses like Kebab shops, but also takeaway outlets, snooker halls etc were also used to launder criminal funds. The money generated through these company accounts was in excess of the funds generated by comparable businesses.

Human Trafficking by Organised Criminal Gangs may use alternative cash intensive businesses, for example, saunas and massage parlours, bars and nightclubs and casinos have been used to both launder cash and as venues for the offering of prostitution services. Chinese Triads may utilise Chinese laundry services and Italian Mafia and the Italian American Mafia may similarly utilise Italian restaurants. Individual bank accounts may be opened and utilised though human traffickers will want to avoid large concentrations of cash deposits into single accounts and repeat wires, particularly offshore which could raise suspicions. Use of multiple accounts and credit cards from various financial institutions may therefore be used with the effect that turnover is diluted. Use of associates, family members and use of alias identities, may also be used to open and operate accounts, also use of front companies. Human traffickers are often well connected with those able to forge identification documents.

Illicit Arms Trafficking

About 526,000 people lose their lives every year due to armed violence, which is commonly fuelled by illicit weapons. That is the equivalent of one person dying violently every minute.

UN August 30, 2012 press release DC/338⁷

Harms

When weapons are smuggled into a country and sold illegally, government regulations to identify buyers and license users don't apply, which makes it easier for criminals to obtain weapons. The black market for arms can include tanks, radar systems that detect Stealth aircraft, and components for weapons of mass destruction. However, small arms transfers fuel crime and sustain armed conflicts worldwide, from Afghanistan to Liberia to Colombia. Regions plagued with state conflict and ethnic and religious disputes stoke demand for small arms. Terrorist Groups rely on the black market for arms supplies. An inexpensive shoulder-fired surface-to-air missile can destroy a commercial airliner.

"Armed conflict, often fuelled by illicit weapons, destroys communities and extinguishes any hope of eliminating poverty for millions of people," said Stan Nkwain, Chief of Policy and Planning at the UN Development Programme's Bureau for Crisis Prevention and Recovery. "When these weapons fall into the hands of criminals, combatants and terrorists, they destroy economic stability, undermine the rule of law and subvert legitimate Governments," he added. "Also, armed violence and violence against women are tragically interlinked, as having weapons in the hands of abusers increases the risk of domestic violence." UN August 30, 2012 press release DC/338⁷.

Statistics

According to the Small Arms Survey,³ authorized transfers of small arms and light weapons, their parts and accessories totalled at least US\$8.5bio in 2012 or more than double the previous estimate in 2006, with ammunition accounting for half that amount.

The Survey also reported that there are an estimated 875 million small arms in circulation worldwide, produced by more than 1,000 companies from nearly 100 countries.

The upsurge in procurement was as a result of the conflicts in Afghanistan and Iraq, and the arming of State actors. Additionally, civilian procurement in the US as well as greater transparency were credited with

reasons for the increases.

Despite improvements in transparency, few countries scored well focussing on just such a measure. From 54 countries examined in 2013, judging them on a 25-point scale. Switzerland had been the most transparent, followed by Germany, Romania, Serbia, Netherlands and the UK and at the other end of the scale, Iran, North Korea, Saudi Arabia and UAE had been the least transparent, scoring zero. China and the Russian Federation, both importers as well as exporters, were also in the bottom 15.

Transparency Barometer	
1	Switzerland
2	Germany
3	Romania
4	Serbia
5	Netherlands
6	UK
50	South Africa
51	Iran
52	North Korea
53	Saudi Arabia
54	UAE

Source: Small Arms Survey 2013⁴

For some of the least transparent countries they might not produce weapons, but they re-exported and re-transferred them. Looking at the top exporters, the US had topped the list of 12 countries exporting at least \$100 million worth of small arms and light weapons. Two of them, France and Japan, had reached that figure for the first time, while Italy, Germany and Brazil had also ranked high.

Whilst there is increasing transparency and an understanding of still the dangers of the trade in licit weapons, the trade in illicit weapons remains a matter of grave concern. According to the head of the Small Arms Survey, Mr. Berman claimed that the combined figure for licit and illicit trade could be more than US\$10bio, placing the estimate of illicit arms at approx US\$1.5bio.

Whilst it is often assumed that the illicit arms trade causes most concern in nascent war zones fueling violence, it is in non-convict or war zones where the most damage is inflicted. Countries such as El Salvador,

Jamaica, and South Africa suffer from extremely high recorded levels of murder's with more deaths each year than in many contemporary wars.

Non-conflict deaths are often distinguished from the deaths that arise from armed conflict based on the organisation of the killing. Homicide is usually committed by individuals or small groups, whereas the killing in armed conflict is committed by relatively cohesive groups of up to several hundred members. But there is often little difference in intensity between large-scale criminal violence and low-level armed conflict, and the line between the two is frequently blurred.

Approximately 60% of all violent deaths are committed with firearms, with variation from a low of 19% in West and Central Europe to a high of 77% in Central America, based on data from 45 countries. That represents 245,000 firearms deaths per year.

Non-conflict armed violence includes murders, suicides, extra judicial killings, and other forms of death or injury, such as those resulting from domestic violence or gender-based armed violence, social cleansing, or disappearances and kidnappings.

Definition/Description

Arms trafficking, also known as smuggling or gunrunning, is the illegal transfer of contraband weapons or ammunition. What constitutes legal arms trade depends on which of a wide variety of laws apply.

While there is no universal definition of small arms or light weapons, a widely adopted definition is that proposed by the 1997 Report of the UN Panel of Governmental Experts on Small Arms. The Panel's list is organised into "small arms" and "light weapons": "small arms": revolvers and self-loading pistols, rifles and carbines, assault rifles, sub-machine guns and light machine guns and light weapons: heavy machine guns, hand-held under-barrel and mounted grenade launchers, portable anti-aircraft guns, portable anti-tank guns, recoilless rifles, portable launchers of anti-tank missile and rocket systems; portable launchers of anti-aircraft missile systems (MANPADS); and mortars of calibres of less than 100mm.⁵

Small arms are for personal use, and light weapons are for use by a unit of persons. Ammunition and explosives also form an integral part of small arms and light weapons used in conflict.

Whilst in 2005 a Protocol against the Illicit Manufacturing and Trafficking in Firearms, their parts and components and Ammunition (Palermo

Protocol) was issued, supplementing the Convention against Transnational Crime in 2000 which focussed on illicit arms trafficking encouraging parties to the protocol to adopt and implement the strongest possible legislation to investigate and prosecute those found guilty of illicit arms trafficking, UN Member States failed in 2012 to negotiate a more comprehensive Arms Trade Treaty to establish standards for international trade in conventional weapons. However, in August of 2012, the UN launched "International Small Arms Control" to monitor Member States' implementation of the programme they had agreed to in 2001 – the 'Programme of Action to Prevent, Combat and Eradicate the Illicit Trade in Small Arms and Light Weapons in All Its Aspects.' The programme focused on making illicit gun manufacturing a criminal act, destroying surplus supplies of weapons, and creating processes for identifying and tracking weapons.

Finally in 2013 the UN Arms Trade Treaty was adopted which provides for common international standards for the import and export and transfer of conventional arms.

Some bilateral government initiatives focus on hot spots for trafficking. For example, the US-Mexico Mérida Initiative was launched to disrupt the flow of firearms, ammunition, explosives and bulk cash being trafficked/smuggled from the US into Mexico. US and Mexican agencies are sharing a web-based system which allows investigators to trace weapons known to originate from the US. On the supply side, the US is taking more steps to secure and destroy excess weapons stockpiles and to mark weapons with traceable identifiers. Strategies to disrupt the operation of these smuggling rings include training and coordination in investigations, prosecutions, and bulk cash seizures.

But in general, effective multilateral frameworks to combat arms trafficking are not yet in existence, and this fact benefits traffickers. Dealers hopping from one jurisdiction to another can take advantage of inconsistent legal requirements.

Black market arms dealers don't usually identify themselves as such. For example, arms trafficker Viktor Bout, identified himself as being in the transport business. Traffickers tend to move before establishing a reputation, and gravitate towards countries with either few regulations, ample opportunities for corruption or good transport and logistical support. Viktor Bout for example, used one of the lesser known Emirates of the UAE, Sharjah as have others.

Historical Background/Content

Since the end of the Second World War, tens of millions of people have been killed by conventional weapons, mostly small arms such as rifles, machine guns and rocket-propelled grenade launchers. Sales of advanced weaponry, fighter jets and high-tech electronics, sophisticated long-range artillery and warships, and "weapons of mass destruction" tend to receive the most press coverage. But these costly, sophisticated weapons have not proved as deadly as ordinary guns and grenades that are easy to buy, easy to ship and easy to use.

Low-tech, handheld weapons and explosives do the vast majority of the killing today. There are more than 550 million small arms currently in circulation, many of them fueled bloody civil strife in countries from Angola to Afghanistan, Colombia to the Congo Sri Lanka to Sierra Leone and Somalia to Sudan and in many more.

In most cases, the countries involved in these conflicts have been the subject of international embargoes imposed by the UN and other organisations. In some cases, major powers want to supply the side they favor in the conflict but do not want their "fingerprints" to be discovered on weapons of war, with the recent struggles in Libya and in Syria being good examples.

Against this backdrop of embargoes and clandestine international politics, a specialized group of arms dealers emerged during the Cold War. Their role was to ensure that responsibility for the death and destruction could not be traced directly to the supplier and they pocketed millions for themselves in the process.

The richest and longest-lived practitioners of this business simply "fronted" for a particular government or alliance or even "ruling family." In the 1950s and 60s, the late legendary Sam Cummings, a CIA veteran, supplied anyone who had US government approval with weapons from stockpiles in the US and the UK. And, of course, there were the "middlemen" such as Adnan Khashoggi, who in the 1970s and 80s often fronted for the interests of the Saudi royal family, whilst acting as a commission generating Intermediary for US Arms companies.

But it is not only individuals who operated in the clandestine international arms market. In some instances, countries that were subject to embargoes also got into the clandestine weapons business. Israel, apartheid-era South Africa and Taiwan are examples of countries compelled to develop their own arms industries and to seek to circumvent international trade bans against them.

During the first 25 years of its existence, Israel was often denied weapons and ammunition by US and European governments, as well as most nations in Asia and, of course, the Middle East. As a result, it built its own arsenal and related industries that are to this day active internationally. Israeli arms and trainers have turned up in China, Guatemala, Ecuador and Central Africa. Israel Defence Industries has a long history of both procurement and development of military technology and its sale overseas. The man once known as the richest Israeli, the late Shaul Eisenberg, is an example of the "legitimate" arms entrepreneur using the trade in weapons and weapons technology to create a multi-faceted business empire.

Money Laundering

It is the role of the clandestine middleman, the so called "Lords of War" or "Merchants of Death" that have made their marks in indelible ink over more than 50 years helping dictators bent on genocide and rebels relishing revolution spill the blood of millions that is of greatest concern. Often, they are the key players who provide the deniability that the government supplying the weapons seek. They can all trace their steps back to the "super salesman of death", the "mystery man of Europe" the "Monte Cristo of our Time", Basil Zaharoff who was at the turn of the last century, the worlds first flamboyant larger than life arms dealer, a man who once boasted of starting wars in Africa so he could sell weapons to both sides, who helped arm the great powers culminating in the First World War! his greatest achievement and as a result of his success, many have since attempted to emulate.

Each are largely motivated by money but the consequences of their actions can be staggering irrespective of the monies earned. As Henry Ford famously stated, "show me who makes a profit from war, and I'll show you how to stop a war".

Some of the most successful individuals making most out of war in the twentieth century include: Sam Cummings and Adnan Khashoggi, the list of shame includes: Dale Stoffel; Dr. Moosa Bin Shamsher; Fares Mana'a; Sarkis Soghanalian; Monzer al-Kassar; Pierre Falcone and his partner; Arcady Gaydamak; Jean-Bernard Lasnaud; Leonid Minin; Tomislav Damnjanovic; Simon Mann; Andrew Wang (see Thomson CSF-Thales) and Viktor Bout and many more.

Insider Dealing

"The public's out there throwing darts at a board, kid. I don't throw darts at a board; I bet on sure things,"

so said Gordon Gekko in Oliver Stone's

1980s-defining film "Wall Street." With those words, the "greed is good" trader, largely based on Ivan Boesky, explained to his young protégé how inside information can turn investment into a one-way bet.¹

Introduction

Whilst individuals are generally entitled to trade in the securities of the corporations with which they are involved or to trade in other securities without restriction, such trading becomes illegal Insider Dealing when privileged, non-public, material information is used by an individual to buy or sell a security or to tip someone else off who may trade.

Harms

Insider trading is both a theft and a financial Fraud. The victims are all those market participants that play by the rules, investing based on publicly available information and dealing honestly. The abuser, when he trades on inside information cheats every other participant and offends the principles of the Markets that honest participants rely upon.

Illegal insider trading is also believed to raise the cost of capital for securities issuers, thus decreasing overall economic growth.

According to US Attorney Preet Bharara in a widely reported October 20, 2010 speech to the New York Bar Association,² illegal insider trading is rampant and may even be on the rise, with some cheating the system including not only some at Wall Street firms, but also at Main Street companies. Bharara made the point that many of the people who are going to such lengths to obtain inside information for a trading advantage are already among the most advantaged, privileged, and wealthy insiders in modern finance. Widely quoted Bharara then stated that "But for them, material non-public information is akin to a performance-enhancing drug that provides the illegal "edge" to outpace their rivals and make even more money. In some respects, inside information is a form of financial steroid. It is unfair; it is offensive; it is unlawful; and it puts a black mark on the entire enterprise."

Some however take a different view. For example Milton Friedman argues that laws making insider trading illegal should be revoked, claiming that insider trading based on material non-public information

benefits investors, in general, by more quickly introducing new information into the market. He stated that, "You want more insider trading, not less. You want to give the people most likely to have knowledge about deficiencies of the company an incentive to make the public aware of that." Friedman did not believe that the trader should be required to make his trade known to the public, because the buying or selling pressure itself is information for the market. Other critics argue that insider trading is a victimless act: A willing buyer and a willing seller agree to trade property which the seller rightfully owns, with no prior contract (according to this view) having been made between the parties to refrain from trading if there is asymmetric information. The Atlantic has described the process as "arguably the closest thing that modern finance has to a victimless crime".

Statistics

The UK FSA reported in 2005³ that they had looked into market cleanliness by reviewing the extent to which share prices moved ahead of significant, potentially price sensitive, regulatory announcements that companies are required to make to the market. This analysis was conducted for two types of statements - trading statements made by FTSE 350 issuers and public takeover announcements related to UK companies.

The figures for FTSE 350 issuers showed a marked improvement in the level of untoward activity down from 19.6% in the period 1998-2000, to 11.1% in 2002/03 to only 2.0% in 2004/05. However, the figures for takeover announcements were 32.4% in 2004 to 24% in 2000. The latest figures for 2005 were 23.7%. This led the UK regulator to conclude that nearly a quarter of all UK mergers and acquisitions in 2005 involved "informed trading". The regulator admitted that the level of suspect trading is "higher than we would expect in a clean market. The regulator believes that the risk of leakage is heightened by the way transactions are conducted and the number of people involved in the process. For example, in a recent investigation FSA were provided with an insiders list of over two thousand names. Lists, and indeed the transactions to which they relate, often include multiple parties and numerous advisors; this inevitably increases the risk of information leakage.

Figures collated by Thomson Financial in 2007 for a UK newspaper, also pointed to the widespread likelihood of illegal pre-takeover trading. They showed that the share prices of several of the UK's biggest takeovers moved materially ahead of the announcement of bid talks. For example, George Wimpey's shares rose by 18p to 653p on the announcement that it was merging with Taylor

Woodrow. The shares had already risen from 540p on March 14, however. ICI, which jumped from 549p to 634.5p on 18 June after Akzo Nobel said it was looking at buying the former bellwether stock, had already risen from 506.75p in only five trading sessions.

A study by Measuredmarkets Inc. in August 2007⁴ in the USA showed that insiders may have traded illegally in advance of 41% of the largest US acquisitions the previous year. Two months later, Credit Derivatives Research LLC found⁵ that credit-default swaps based on the bonds of 30 takeover targets, including four of the five biggest leveraged buyouts by that point in 2006, rose before deals were announced.

Also in 2007 it was reported that, trading in options to buy shares of TXU Corp. surged more than seven-fold before CNBC said the company would be acquired in the largest-ever leveraged buyout and the volume of options trading to buy shares of Hyperion Solutions Corp. rose almost six-fold before Oracle Corp. said it would buy the company for US\$3.3bio.

The demand for performance among hedge funds where a percentage point in performance can mean the difference in millions of dollars of additional compensation based on pre agreed performance fees is a clear risk factor. In the US there are more than 9000 hedge funds in operation today, managing US\$1.4 trillion, with some estimates placing assets as high as US\$2.3 trillion, plus 6 to 1 leverage. About a thousand of these same hedge funds go out of business every year, with a 1000 new start-ups coming on stream. The incentive for some to engage in Insider Dealing is obvious.

Definition / Description

Today, insider dealing and market abuse are largely accepted as requiring both criminal and administrative sanctions. The international framework has been shaped by the anti trust and securities reforms initiated in the US and largely adopted as common principles throughout the world where Markets for Financial Instruments are found.

It wasn't until the 1980s that insider dealing would really hit the headlines, when major prosecutions grabbed the media's attention and later many countries then started to criminalise insider dealing. Whilst the US relies on broad anti-fraud provisions contained in the federal securities laws, e.g., Section 10(b) of the Securities Exchange Act of 1934 and Rule 10b-5, the EU and much elsewhere in the world relies on a specific statute, though in practice the laws are similar. Whilst the EU passed insider dealing laws in 1989, following

13 years of discussion. Notwithstanding criminalization, it would still take another 20 years before many including the UK and others in Europe began to make insider dealing prosecutions a priority.

Insider Dealing

Generally speaking, insider trading is when a corporate insider trades in the securities of his or her corporation on the basis of material non-public information. In the US the so called "classical" theory of insider trading targets a corporate insider's breach of duty to shareholders with whom the insider transacts. The more recent US "misappropriation" theory prohibits trading on the basis of non-public information by a corporate outsider in breach of a duty owed not to a trading party (i.e., the shareholders of the company), but rather to the source from which the trader learned the information.

Tipping Off

Insider Dealing liability can also apply to "Tipping off" someone who makes a trade, so that even if a person does not make a trade himself, if he shares non-public information with someone who makes a trade based on his information, both he and the person who actually makes the trade can be guilty of insider dealing.

Misuse of Information

A related malpractice is the "Misuse of Information," where for example a customer of a financial services firm places an order for a large block of stock, whether buy or sell, this information is proprietary to the customer and should be kept confidential by the broker involved. Nevertheless, individuals with knowledge can trade ahead or at the same time, personally benefitting. Such trading is normally in breach of applicable law and/or regulations and is known as Front and or Parallel Running (see below for details).

FATF have included insider dealing alongside market manipulation as a predicate offence for money laundering in their 40 Recommendations.

United States

The US has relied largely on its courts to develop the law prohibiting insider trading and market abuse. Whilst a form of insider dealing conviction was obtained in 1909 when the US Supreme Court in *Strong V Rapide* held that a company official was obliged to disclose his identity and non-public information when he trades his stock, it wasn't until after the US stock market crash of 1929 that brought the Securities Act of 1933 and the Securities Exchange Act of 1934, aimed at controlling the abuses believed to have contributed to the crash, that a statutory response was codified. The 1934 Act addressed insider trading

directly and indirectly and has been supplemented by later SEC rulemaking and case law. For example, whilst the Securities Act S.17(a)(1) prohibited fraud and misstatements in the sale of securities, there was no comparable provision prohibiting such practices in connection with the purchase of securities. In 1942, the SEC remedied this oversight adding the words ‘in connection with the purchase or sale of any security’ and promulgated Rule 10b-5 which then read: It shall be unlawful for any person, directly or indirectly . . . , (a) to employ any device, scheme, or artifice to defraud, (b) to make any untrue statement of a material fact or omit to state a material fact necessary in order to make the statements made, in light of the circumstances under which they were made, not misleading, or (c) to engage in any act, practice, or course of business which operates or would operate as a fraud or deceit upon any person, in connection with the purchase or sale of a security. These broad anti-fraud provisions make it unlawful to engage in fraud or misrepresentation in connection with the purchase or sale of a security and therefore cover both insider dealing and market manipulation. In the more than 50 years since its adoption, this simple rule has been involved in countless SEC and private proceedings, and applied to almost every conceivable kind of situation. In the 1960s and early 1970s, many federal appellate courts and district courts developed expansive interpretations of Rule 10b-5 (and other antifraud provisions of the securities laws). One of the first cases that established the modern insider dealing offenses was that of *Cady Roberts & Co* 1961. Increasingly liability for negligent as well as deliberate misrepresentations, for breaches of fiduciary duty by corporate management were imposed and for failure by directors, underwriters, accountants and lawyers to prevent wrongdoing by others.⁶ Further ad hoc rule making has continued for example, in 2000, the SEC enacted Rule 10b5-1, which defined trading “on the basis of” inside information as any time a person trades while aware of material non-public information - so that it is no defence for one to say that she would have made the trade anyway. This rule also created an affirmative defence for pre-planned trades.

United Kingdom

Insider dealing has been a criminal offence in the UK since 1980. Steps to introduce legislation took a number of years. Up to the end of World War II the buying and selling of stocks and shares in a company on the basis of information known only to the company or its directors, officers and advisors was considered legitimate and widespread. Between the end of the World War II and the late 1950s it began to be considered unethical to make private profits at the expense of the main body of shareholders but in the 1960s and early 1970s the

practice became widespread once more, often using knowledge of a take over. Insider dealing was even described by the Financial Editor of the Sunday Times in 1973 as the “crime of being something in the City”.⁶ In 1973 The Stock Exchange and the Takeover Panel issued a joint statement calling for criminal sanctions. A number of subsequent attempts to pass legislation through Parliament failed, but in 1980 Part V of the Companies Act 1980 came into force and made insider dealing a criminal offence in certain circumstances. These provisions were subsequently consolidated as the Company Securities (Insider Dealing) Act 1985, and amended by the Financial Services Act 1986. The impetus for further reform then came from within the European Community when in 1989, the Council of the EC agreed on a Directive to co-ordinate regulations on insider dealing (see below). In the UK, the relevant law implementing the EU Insider dealing Directive is The Criminal Justice Act 1993 Part V. In the case of Market Abuse it took until 2000 and the passing of The Financial Services and Markets Act 2000, which defines an offence of Market Abuse and was followed by the FSA’s Code of Market Conduct which sets out in detail the standards that should be observed by everyone who uses the UK’s key financial markets, whether they are trading in the UK or from overseas.

Section 118 of the Financial Services and Markets Act 2000 (FSMA), remains and now incorporates existing EU MAD legislation, i.e. the EU Market Abuse Directive (MAD) which came into force in July 2005. The MAD provisions were similar to those in a number of existing EU countries, in particular in the UK. The UK FSA issued a Code of Market Conduct⁷ (August 2009)⁸ which runs to 52 pages and covers seven market abuses spanning- i) insider dealing, ii) improper disclosure, iii) misuse of information, iv) manipulating transactions, v) manipulating and “fictitious” devices, vi) dissemination of information, and vii) misleading behaviour and distortion. For more information see the UK FSA Code of Market Conduct (issued August 2009).

European Union

In the European Community it wasn’t until 1989 that the EC agreed on a Directive to co-ordinate regulations on insider dealing. The EC Directive was thirteen years in the making; the first deliberations beginning in 1976. The Directive was modelled on French and English insider trading prohibitions. At the time the Directive was passed, four of the 12 members of the EC - West Germany, Belgium, Italy and Ireland - had no insider trading legislation on the books and the remaining eight members - France, England, Luxembourg, the Netherlands, Denmark, Greece, Portugal and Spain -

had widely varying statutes. Several of the members took time well beyond the 1992 deadline to get legislation in place. Luxembourg, for example, enacted its version of the Directive in 1997. The Directive defines “inside information” as information of a “precise nature” about security or issuer which has not been made public which, if it were made public, “would likely have a significant effect on the price” of the security (Article 1); It prohibits insiders from taking advantage of inside information (Article 2); It prohibits insiders from tipping or using others to take advantage of inside information (Article 3); It applies its prohibitions to tippers with “full knowledge of the facts” (Article 4); It requires each member to apply the prohibitions to actions taken within its territory with regard to securities traded on any members’ market (Article 5); It provides that members may enact laws more stringent than set out in the Directive (Article 6); It requires issuers to inform the public as soon as possible of major events that may affect the price of the issuer’s securities (Article 7); It requires members to designate an enforcement authority, to give it appropriate powers and to bind it to professional standards of confidentiality (Articles 8 and 9); It requires members to cooperate with each other in investigation efforts by exchanging information (Article 10); It leaves it up to individual members to decide on penalties for insider trading (Article 13); and finally, It required all members to enact legislation complying with the Directive by June 1, 1992. A fundamental difference between the EC Directive and the US’ prohibition against insider trading under Section 10b and Rule 10b-5 as developed by the courts, is that the Directive does not require that the insider trader breach a fiduciary duty to the source of the information for liability to attach. In this respect, it mirrors the US’ prohibition against trading on the basis of non-public information about a tender offer under Section 14(e) of the Securities Exchange Act of 1934 and the Commission’s Rule 14e-3.

International Securities Regulation

The leading body active in this field is the International Organisation of Securities Commissions (IOSCO) who published in 1998 The “Objectives and Principles of Securities Regulation”⁹ updating these in 2003 stating amongst other things that “Investors should be protected from misleading, manipulative or fraudulent practices, including insider trading, front running or trading ahead of customers and the misuse of client assets.” More than 85% of the world’s securities and commodities market regulators are members of IOSCO and have signed on to these Core Principles. The World Bank and International Monetary Fund now use the IOSCO Principles in reviewing the financial health of different country’s regulatory systems as part of these

organisations’ financial sector assessment programme, so laws against insider trading based on non-public information and misleading, manipulative or fraudulent practices are now expected by the international community. Enforcement however varies widely from country to country, but the vast majority of jurisdictions now outlaw these practices, at least in principle.

Switzerland

Under pressure to step up the battle against insider trading. Insider trading only became a crime in Switzerland in 1988, but the law was written far more narrowly than in other countries. Unlike the UK or the US, insider trading was an offense only in relation to the issue of new securities, mergers and acquisitions, but not ahead of earnings announcements, even when they contained potentially market-moving information. Moreover, Swiss law didn’t require mandatory jail time, and the fines were considered low by some politicians and regulators to be an effective deterrent. According to FINMA Circular 2008/38 – Market Conduct Rules,¹⁰ “Securities trading is to be based upon generally available or published information on securities and issuers or upon information derived therefrom. Information on securities and issuers is deemed generally available when it is published or disseminated in the media or via the usual information channels in the financial sector, or if it is derived from such information. All other information on securities and issuers is to be regarded as confidential. Misusing knowledge of confidential price-sensitive information for securities transactions is not permissible (misuse of information). Information is deemed price-sensitive where it is capable of significantly influencing the stock market price or the valuation of the respective securities. Specifically, such information pertains to circumstances that substantially impact a company’s organisational structure, its executive and business management bodies, its course of business, its financial or earnings situation and thus its valuation, and is therefore capable of effecting material changes in the market price. These circumstances may be grounds for public disclosure and/or be subject to legal or self regulatory requirements to provide information (disclosure obligations pursuant to Art. 20 SESTA or ad-hoc publicity according to stock exchange regulations). The wrongful dissemination of confidential price-sensitive information or making references or recommendations based thereon pertaining to engaging in securities transactions are also deemed to constitute misuse of information. Rumours or vague hints are not deemed confidential information. However, knowingly spreading rumours or vague hints for the purpose of invoking same is not permissible. Taking advantage of the expected market reaction of market participants and of securities prices employing

the knowledge of an impending announcement of investment recommendations ("scalping") is not permissible

Looking ahead, a further tightening of laws on Market Abuse is expected with for example, the EU MAD 2 regime, new Swiss insider dealing laws and new provisions within Dodd Frank in the US, all either recently in force or to have effects in the years to come. For more details see Part 1, Section 3, Money Laundering Laws & Regulations below.

Regulatory Expectations on Financial Institutions

According to the UK FSA "All financial services firms are responsible for ensuring that their employees are vigilant in preventing market abuse. In doing so, firms should look to determine: (i) That all staff have been adequately trained and understand what constitutes market abuse; (ii) That market abuse controls stand up to increased scrutiny from the regulator. In particular, whether: a) Conflicts of interest controls pass a thematic regulatory review; b) Confidential and price-sensitive information remain secure; c) Risk-based compliance monitoring programmes are frequently reviewed; and d) Whether current management information effectively alerts senior management to potential problems; e) Whether recent market troubles have increased the occurrence, opportunity or discovery of market abuse; and f) Whether the compliance department is adequately staffed to ensure resource is not diverted away from monitoring or tackling market abuse.

In a speech given by Margaret Cole, then Director of Enforcement at the UK FSA in 2007 she stated that,"We firmly believe that prevention is better than cure and to this end we have made it clear to market participants that we expect proper conduct including: appropriate and effective systems and controls in form of robust internal procedures; an insider list that is short as possible and based on need-to-know; a willingness to undertake a thorough internal review following a leak; effective and targeted training of staff including support staff; monitoring of staff personal account dealing; robust controls when dealing with third parties; effective information technology controls; and an awareness of the limitation of code words as an effective tool to keep information confidential, especially if used in isolation."

In the US, the New York Fed has stated that it has general expectations of good practice as follows: "Trading desk management and the supervision, legal, and compliance staff should work collectively to ensure that any questionable trading practices are identified and addressed in a timely manner. Trading desk management and supervision should be aware of, and responsible for, strategies executed by the trading

desk. Other control functions, and particularly legal and compliance staff, should be poised to promptly evaluate and respond to questionable trading practices should they occur. Firms should aspire to provide system tools that relay real-time trade position information to the compliance function in order to provide timely notification of large positions."

From pronouncements and speeches made, key areas of increased concern include, high frequency trading, the size of insider lists, low value securities, (so called "Penny Stocks"), options and futures markets, energy and commodities markets, dark pools and MTFs, hedge funds customer insiders and expert networks as well of course of classic manipulative practices (see Market Manipulation below) manipulative rate fixing and collusive and anti competitive practices.

Historical Background / Content

For many years governments on both sides of the Atlantic (and now in APAC and elsewhere) relied on markets to drive economic growth and political influence and despite obvious abuses, were loath to interfere in the so called free markets, afraid of stifling their development. There are many hundreds, if not thousands of examples through the years of significant abuses perpetrated on market participants, including investors, that have unfairly disadvantaged the abused and undermined the integrity of the markets involved but only a few have led to increased governmental intervention to regulate free markets.

The history of market abuse is interwoven and inseparable from the history of markets themselves, both in their advances and in their reversals. In many cases it is the publicised abuses themselves and their proponents that both triggered and accelerated many of the most significant market reversals and these consequences that eventually encouraged legislators and judges to shape today's legal and regulatory frameworks and institutions responding towards Market Abuse. The staggering success of the Dutch East India Company, listed on the very first Stock exchange in Amsterdam and lasting 200 years returning an average annual dividend of 18% is a shining example of the power and utility of Markets, whereas the British South Sea Company, which led to the South Sea Bubble in 1720 and a calamity in England is a shining example of what can happen when things go badly wrong with Markets. There are many more examples of both great companies and investments, of great entrepreneurs and robber barons, of captains of industry and crooks that illuminate the story of the development of Markets and highlight the constant attempts to abuse them for personal gain. Whilst booming Markets followed by occasional Panics

and Crashes were the norm throughout the Eighteenth and Nineteenth century it was not until the Twentieth Century, that the laissez faire attitude towards Markets and their regulation began to change and a new way forward proposed. The new way was pioneered in the US, which until then had taken a staunchly free market approach. It would take until the end of the so called first Gilded Age or the end of the reign of the Robber Barons beyond the turn of the Twentieth Century, before a backlash against Market Abuse would be seen. This did not equate to a backlash against Markets per se, which had largely been credited with the emergence of the US as the worlds foremost industrial superpower. The backlash focussed first though on monopolistic corporations being confronted with the enactment and use of The Sherman Anti Trust Act of 1890, the implosion of Charles Ponzi's pyramid scheme in 1923 and then the bursting of the Florida Real Estate Bubble and Crash in 1926 which was a foretaste of something much bigger, the Stock Market Crash of 1929 and the Great Depression that followed, affecting both rich and poor, which led to the Securities Market Reforms (1933 & 1934) and the establishment of the SEC as part of America's New Deal."

For the next 40 years or so, negative headlines would largely be grabbed by ad hoc unexpected accounting frauds, for example McKeeson & Robbins in 1937 which led to the tightening in external audit procedures and ZZZZZ Best which relied on phantom contracts and sales figures to mislead investors. The Insider Dealing offence in the US would be developed through prosecutions, each time the offence would become more broadly interpreted, for example in 1961 in Cady, Roberts & Co and in the early 1980s in Chiarella, Newman and Dirks and then with the prosecution and conviction of R Foster Winans the co writer of the WSJ's "The Heard on the Street" who leaked advance word of the contents of this widely followed stock picking publication.

The mid 1980s would bring the story into the modern age. With deregulation, markets prospered and capital flowed more easily and with the rise of leverage, including the availability of junk bonds for financing, a mergers and acquisitions boom was unleashed. Insider dealing would take centre stage in 1985 with the arrest of Ivan Boesky, (Gordon Gekko), being followed by a string of others including Ernest Saunders and the Guinness Gang of Four in the UK and the prosecution of "Junk Bond King" Michael Milken and the fall of Drexel Burnham Lambert. Many countries then took the opportunity to criminalise insider dealing following the US and latterly the UK's lead, though it would still take another 20 years before many including the

UK began to make insider dealing prosecutions a real priority. In 1987 following a bull market run of over 5 years US Markets turned on 19 October 1987, a date that subsequently became known as "Black Monday," which was the greatest loss Wall Street had ever suffered on a single day. Nevertheless, by September 1989, the market had regained all of the value it had lost in the '87 crash.

The 1990s followed the passing of EU wide laws on insider dealing in 1989, following 13 years of discussion. More prosecutions for insider dealing in the US continued but none with the profile of the previous decade. A major market manipulation scandal at Salomon Brothers in 1991 in New York forced the toppling of their legendary CEO, John Gutfreund (of Liar's Poker fame) and the firm was saved from probable extinction by the even more legendary Warren Buffet. From the middle of the decade, we would see the start of the dot-coms. By October 1999, the six biggest tech stocks of that time - Microsoft, Intel, IBM, Cisco, Lucent and Dell - boasted a combined value of US\$1.65 trillion, or 20% of the US gross domestic product (GDP). Whilst these great companies prospered, most did not. In 1998, internet community site Globe.com had set a record with an IPO that sky-rocketed 606% on its first day of trading, but like many others, it would run out of initial capital and quickly go bust. The subsequent demise of the dot-coms triggered a panic with the bubble bursting on 10 March 2000. By the end of 2000 the NASDAQ slid to 2471 from the March peak of 5048.

The bursting of the bubble, brought Eliot Spitzer, the NY District Attorney to the fore, crusading first against research analysts at Merrill Lynch, principally Henry Blodget, and then others including Jack Grubman at Salomon Smith Barney, part of Citigroup, alleging fraud in continuously supporting dot-com companies publicly while privately having grave concerns over their prospects or viability. Spitzer's investigation would lead to wholesale changes, cleaning up research practices and conflicts of interest across all of Wall Street. For details see the Global Analyst Research Settlement in Part 2, Section 8. Spitzer would then turn his attention to late trading and market timing malpractices first on Edward Stern and Canary Capital, but in time to others including Bank of America, Bank One, Janus and Strong Capital Management and in doing so he would have a similar effect on the US Mutual Fund Industry as he did on the Investment Banking Industry. For details see the Mutual Fund Scandal in Part 2, Section 8.

The bursting of the bubble and the resulting economic downturn coincided with the demise of some leading

businesses, including Enron and then soon followed WorldCom, each the then largest corporate failures in history, with others Tyco, Global Crossing, Qwest, Adelphia, HealthSouth and in Italy, Parmalat - all guilty of massive accounting fraud. In the case of Enron, its failure was preceded by both insider dealing in the Executive Suite and by criminal market manipulation of the California electricity markets which led to the California Electricity Crises in 2000 / 2001. Enron would also take its auditors, Arthur Anderson down with it. To address these scandals Sarbanes Oxley in the US was passed in 2002 to strengthen accountability of auditors, top executives and boards.

Also in the early part of this decade the SEC adopted Regulation FD and Rule 10b5-1, requiring Companies not to make selective disclosures and further tightening restrictions on insider dealing but also providing a safe harbour for pre planned trades.

During this decade insider dealing was joined by offences relating to manipulating markets in many parts of the world and whilst actions against manipulators would still lag behind insider dealing cases these picked up and both insider dealing and market manipulation became the focus of regulators worldwide with regular prosecutions of both individuals but also firms, record terms of imprisonment being secured, penalties and record fines being levied. Cases such as Martha Stewart, Shell, George Soros, Citigroup with their programme trade known as Dr Evil in Europe, Insider Rings, Livedoor in Japan and many others made regular headlines.

With the onset of the Financial Crises in 2007, headlines were dominated by Bear Stearns, then Lehman Brothers, toppling Enron and then WorldCom as the world's largest ever bankruptcy and the frauds at the heart of the US real estate mortgage markets. Bernard Madoff was finally revealed in December 2008 and would be sentenced to 150 years imprisonment for running the world's largest ever Ponzi scheme defrauding investors of more than US\$10-17bio. Others not so large but still in the multi billion dollar range would follow, including Alan Stanford.

In 2010 Raj Rajaratnam a hedge fund billionaire would be arrested and he would receive 11 years imprisonment for insider dealing in the USA. In the USA and elsewhere prosecutions for both insider dealing, front running and market manipulation have dramatically increased.

Money Laundering

Insider Dealing

The detection, investigation and criminal prosecution of illegal insider trading and front or parallel running has become increasingly difficult. This is so for a number of reasons. Among other things, the sheer volume and complexity of modern stock trading heightens the difficulty of pinpointing specific illicit trades that were based on illegally acquired inside information. When an institution or a trader can move in and out of positions quickly and in large volumes, illicit trades become easier to mask, harder to find, and subject to plausible deniability. Moreover, in the modern information age, there has been a veritable explosion of newsletters, websites, blogs, tweets and feeds publishing every last rumour and report of potential mergers and acquisitions and earnings reports. That, of course, makes it easier for an accused insider trader to argue - in the absence of incriminating recorded evidence to the contrary - that any trades were based on some report somewhere, which may never have in fact been believed or even read.

Whilst many cases involve one or more family members co-investing based on inside information, more sinister insider rings have also been uncovered, of particular interest is the involvement of employees of financial institutions and hedge funds in these insider rings, expert networks and the techniques used by regulators and enforcement to uncover and prosecute them but also the lengths individuals go to hide their tracks.

Of course the most celebrated insider case remains the case of Ivan Boesky in the US who used offshore accounts to try to mask his involvement and who was convicted in 1987, and whose story inspired the movie "Wall Street". Boesky was at the centre and was the principal beneficiary of inside information from Wall Street insiders, who also benefited handsomely, alongside Denis Levene from Drexel Burnham Lambert, which had grown strong through its star banker Michael Milken. Soon after Boesky's fall and as a result of this investigation and prosecution links to Ernest Saunders and the Guinness 4 were uncovered and this scandal broke in the UK.

Prior to this and turning back the pages of history come the cases of Albert Wiggin and William Duer and since then there have been many cases where insiders, tipsters and tippees have all fallen foul of the law, some that simply couldn't resist, making money for a time for themselves friends and or relatives and others where the insider dealing is more premeditated, structured and organised and on more an industrial scale.

R Foster Winans who penned a weekly newspaper column called the "Herd on the Street" who traded ahead of his own tips prior to publication, Michael Guttenberg; Winifred Jiau; Ken Lay and Jeffrey Skilling of Enron, who as late as April 2001, before the company's collapse, the very same year alongside 27 other senior Enron executives sold overvalued stock for more than a US\$1bio not long before the company was declared bankrupt; Mehmit Sepil; and Nicos Stephanou; and most recently Raj Rajaratnam and others. Raj Rajaratnam, a hedge fund manager and founder of the Galleon Group, a New York-based hedge fund management firm who created an intricate system of paid insiders across the financial industry that he used to access information to benefit his hedge fund and himself as a result was prosecuted and convicted by US law enforcement who successfully employed tools that typically are used to combat organised crime (wiretaps, cooperators) catching, the ring being uncovered through links to the earlier case of Eric Franklin and others in 2006 where Linda Thomsen, the SEC's then enforcement chief, described the Franklin's insider trading activities as "one of the most pervasive Wall Street insider trading cases since the days of Ivan Boesky and Dennis Levine.

The Franklin case also involved Michael Guttenberg, an institutional client manager in UBS' equity research department in New York was arrested and sentenced in 2006 to six and a half-years in prison and ordered to pay back \$15.8 million he made from his involvement in an insider trading scheme involving several hedge funds. Guttenberg had access to potentially price sensitive confidential information due to his membership on the UBS's Equities investment review committee since 2001. As a member of this Committee, Guttenberg regularly had access to stock recommendations by influential UBS analysts before the information was made public. Guttenberg provided this information to two Wall Street traders, for example a 2006 downgrade of Caterpillar Inc., the world's largest maker of bulldozers, and a 2006 upgrade of Goldman Sachs Group to Erik Franklin and David Tavy, in exchange for a cut in the profits they made from trading on that information. Erik Franklin and David Tavy in turn cut more deals and gave tips to others who made money on this information. He also passed hundreds of tips to Tavy and Franklin. At a meeting at the Oyster Bar in New York's Grand Central Station in 2001, Guttenberg offered to settle a US\$25,000 debt to his friend Franklin, by slipping him analyst ratings in advance. At the time, Franklin was working at Bear Stearns in New York and managing money for Lyford Cay Capital, which invested some of Bear Stearns senior officials. He and his colleague, David Tavy made more

than US\$4mio on inside trades in brokerage accounts they controlled. Three Bear Stearns brokers also traded on Guttenberg's tips. He continued to do this from 2001 to 2006 and was paid hundreds of thousands of dollars, while others who were involved in this insider trading made more than US\$17.5mio. Guttenberg made similar deals with others, including another hedge-fund manager where he routinely provided tips about ratings changes on stocks such as Amgen Corp., Whole Foods Market, and Union Pacific Corp. He tried to cover his tracks by using coded text messages made from disposable cell phones, no use of e-mails, or telephone calls, not trading in his personal account, no wire transfers or cheques accepting monies only in cash.

In a separate but connected scheme, Randi Collotta was working as a compliance officer for Morgan Stanley in New York. Collotta worked with her husband a New York Attorney to leak price sensitive information to her friend Marc Jurman, a broker in Florida, and others for example in 2004 and 2005 information about Johnson & Johnson's failed US\$24.2bio bid for Guidant Corp., UnitedHealth Group Inc.'s US\$8.2bio acquisition of PacifiCare Health Systems Inc. and ProLogis's US\$5.5bio purchase of Catellus Development Corp were leaked. Randi and Christopher Collotta was sentenced to four years' probation and three years' probation respectively. In addition to Marc Jurman, the information was sold to Wall Street hedge fund traders including Erik Franklin at Bear Stearns. As an active Hedge Fund trader, Franklin thought he could bury these trades in the mass of trading conducted on the exchange and via his 50 to 100 different trades per day.

It appears that the SEC was able to pick up irregular profitable trading patterns in the merger and acquisition of two publicly traded companies, Adobe Systems, and its acquisition of Macromedia in 2005, and ProLogis, and its acquisition of Catellus Development. Once the SEC saw the irregular trading, they then focussed on those trading ahead of publicly available information, then matched these professional investors with other public deals to identify whether similar patters could be identified.

Another case worthy of closer attention is that of Chris Littlewood, his wife, and family friend Helmy Omar Sa'aid who all pleaded guilty in 2008 to insider dealing on the London Stock Exchange and AIM listed shares. Littlewood, who earned £350,000 a year working for German investment bank Dresner Kleinwort Wasserstein with access to inside information. Littlewood passed information to his wife who then passed this on to family friend Helmy Omar Sa'aid. The FSA investigation began in August 2008 when

a standard review of trading patterns ahead of the announcement of a possible takeover of a company revealed that Mr Sa'aid regularly bought a small number of shares in the company in the weeks before the announcement. Further investigation of Mr Sa'aid's trading activities revealed that he had made similar trades before 22 other merger announcements. The FSA checked and learned that one Bank had advised on 15 of those 22 deals, and therefore this was most likely the source of the inside information. The breakthrough in the investigation which tied Mr Sa'aid to Mr Littlewood came when the FSA checked Mr Sa'aid's bank accounts and found that a Ms Siew Yoon Lew paid money from her bank account into the account of both men. Siew Yoon Lew was the maiden name of Mr Littlewood's wife. Ms Lew was the conduit by which the insider dealing was conducted. Her husband passed information to her which she then made available to Mr Sa'aid, and after the deal had been made payment was facilitated through her bank account. Littlewood was sentenced to three years and four months in custody, Sa'aid to two years and Mrs Littlewood to twelve months, suspended for two years. Littlewood, 37, spied on colleagues to pass on information so that he and his wife Angie, 39, and her friend Helmy Sa'aid, 34, could make almost £600,000, on investments of £2mio on LSE shares purchased between 2000-2008 in what the judge described as "the biggest prosecution for insider trading ever brought."

Another case, also from 2008 involved Nicos Stephanou who was arrested on insider dealing charges on 27 December 2008, when his Cancun-to-London flight stopped at Newark Liberty International Airport. Stephanou had joined UBS in 2002 after working in the corporate finance department of Coopers & Lybrand LLP and the mergers and acquisitions group at Credit Suisse. Whilst at Credit Suisse in London, Stephanou became friends with Ramesh Chakrapani who later moved to the Blackstone group. In 2006, Nicos Stephanou was a member of the team at UBS that advised ABS on its response to an approach by a consortium of buyers looking to acquire the company prior to ABS publicly announcing that this approach would lead to an agreed takeover. Also in 2006, ELK publicly announced that it had agreed to be acquired by The Carlyle Group. ELK hired UBS as its financial advisor. Nicos Stephanou also worked on this deal. In late 2006, NHI publicly announced that it had retained Blackstone as its financial adviser to consider strategic alternatives and had received a buyout offer from its CEO, but stated that the offer was inadequate. Ramesh Chakrapani as an employee of Blackstone had access to material non-public information concerning this announcement by virtue of his membership of

the team at Blackstone that advised NHI on strategic choices. Ramesh Chakrapani and Nicos Stephanou each provided inside information they were privy to, to family members and to Joseph Contorinis, a hedge fund trader and personal friend at Jefferies Group. Nicos Stephanou, Ramesh Chakrapani and Joseph Contorinis were charged with insider dealing offences. In total, seven individuals were found to be engaged in the insider trading ring which generated a combined total of over US\$11.6mio in illegal profits. Nicos Stephanou served 19 months in custody after his arrest but was then freed following his co-operation in acting as the star witness in the trial and conviction of Joseph Contorinis who received 6 years imprisonment. For more details and case examples see Part 2, Section 7 and Section 8, including the case of SAC Capital in 2013, a Hedge Fund Group, who agreed to pay a record US\$616mio (2 cases US\$602mio and US\$14mio) to settle civil charges on insider dealing from the US SEC and later another US\$1.2bio in 2013.

Misuse of Information

Information that is confidential or owned by one party should not be misused by another party for that other party's own personal benefit. Prime examples include front running and parallel running.

Front/Parallel Running

Front Running / Parallel Running is an investing strategy that anticipates the impact of upcoming trades on the price of a security. In front-running, a person will take a position in a security just before a trade that will likely cause the stock to move in a predictable way is executed.

The most common example of front-running is when an individual buys shares of a stock for himself or for his firm or firms position, just before a large institutional order for the stock which will cause a rapid increase in the stock's price is executed. This information can be obtained legally through, for example, market information about impending trades, or illegally by hearing of new firm research or firm portfolio decisions, for example, by breaches in firms' Chinese Walls.

For parallel running the same applies except that the trading is done at the same time and not in front. A fine for Merrill Lynch in 2010 for front running resulted in a fine of US\$20mio. Other examples include Philip Jabre and GLG Partners, John Kaweske, Ken Mahaffrey and Dipak Patel. For more details and case examples see Part 2, Section 7 below and Part 2, Section 8 below.

Kidnap, Illegal Restraint & Hostage Taking

"If you're out there feeding the bears, the bears are going to keep coming into the camp"

Erik Rye, an adviser for hostage affairs at the US State Department referring to the payment of ransom demands¹

Harms

Kidnapping may seem to be an isolated crime that only affects the family and immediate community surrounding the victim, but its effects are broader than one may think. Through the payment of ransom demands, kidnapping funds terrorist organisations, organised criminal groups and any other criminal enterprise that chooses to use kidnapping as a source of revenue. In developing countries, kidnappings can have an even greater impact, especially high profile kidnappings of foreign expats, by discouraging tourism and foreign direct investment and even creating conditions that could spur human capital flight to neighboring countries.

In certain cases, kidnappings can damage foreign relations between countries. Several countries have policies against payments of ransom arguing the payments encourage more kidnappings. Other countries secretly succumb to the ransom demands and make payments to the kidnappers thereby frustrating and damaging relations with allied countries with policies against these payments.

Statistics

According to the Independent, a UK newspaper, at the end of 2010, US\$1.5bio was estimated to have been paid out in ransom to kidnappers around the world. 2011 statistics show reported kidnapping cases in many countries, or even cities, to be rising over the prior year. Another UK newspaper, the Times, reported that in 2011, there were around 2,954 cases of kidnappings reported across the Pakistani city of Lahore. In 2010, up to 2,831 people were kidnapped. Still, the most effective way to retrieve kidnapped family members is to pay the ransom.²

According to red24, a firm of security analysts, using a variety of criteria, including official and unofficial statistics, anecdotal evidence, overall crime levels and the kidnap risk posed by issues such as political instability, terrorism and police corruption. The countries that pose the greatest risk of kidnap are Afghanistan; Somalia; Iraq; Nigeria; Palestine; Yemen; Venezuela; Mexico; Haiti; and Colombia.³

Highest Risk Countries for Kidnap for Ransom	
1	Afghanistan
2	Colombia
3	Haiti
4	Iraq
5	Mexico
6	Nigeria
7	Pakistan
8	Somalia
9	Venezuela
10	Yemen

Source: red24 2012

In Afghanistan: there are around 950 kidnappings for ransom per year.⁴

In Somalia the piracy and kidnap offshore threat is well established: 24 vessels were seized in 2011 with over 400 hostages taken and 265 still held captive in 2012.⁵

Total ransom money paid to Somali pirates (US\$mio)	
2006	5
2007	25
2008	70
2009	80
2010	180

Source: FATF organised Maritime Piracy and Related Kidnapping for Ransom - July 2011⁶

In Iraq no official figures are available for 2011, but red24's anecdotal evidence suggests the risks remain high. The country provides a complex kidnapping risk environment with criminal, terrorist and politically motivated parties all carrying out kidnappings.⁷

In Nigeria the country records well in excess of 1,000 kidnappings for ransom a year.⁸

In Pakistan, official statistics reveal over 15,000 kidnappings a year and the true number is likely to be higher due to under-reporting.⁹ However, only 10-20% of abductions are for ransom.¹⁰

In Yemen over 200 foreign nationals have been kidnapped over the past 20 years.¹⁰

In Venezuela official statistics revealed over 1,000 kidnappings for ransom in the first ten months of 2011, and the country has one of the highest per capita rates of abduction in the world.¹¹

In Mexico official statistics for 2011 are likely to reveal over 2,000 kidnappings for ransom. However, the actual number is far higher and the Mexican NGO, Consejo para la Ley y los Derechos Humanos (CLDH), reported that its statistics revealed some 17,889 kidnaps.¹²

In Haiti, incident numbers now in the low hundreds, which is a significant decline on 2006 when some 720 incidents were recorded. However, a significant threat persists and per capita abduction rates are second only to Venezuela.¹³

In Colombia, despite a significant reduction in incidents over the past ten years, incident numbers in recent years are still high with 258 kidnappings recorded by the authorities in 2011.¹⁴

According to figures by the US National Counter-Terrorism Center, there were 6,050 people who were kidnapped and held hostage by terrorists around the world.¹⁵

According to the US Treasury Department, the average kidnap for ransom payment to Al-Qaeda in the Islamic Maghreb was US\$4.5mio per hostage in 2010. In 2011, the average amount of ransom paid increased to US\$5.4mio per hostage.¹⁶

Up to US\$70mio is estimated to have been paid to secure the release of Western captives since 2010 - an average US\$2.5mio per victim.¹⁷

Definition / Description

Kidnapping is the taking away of a person from one place to another against their will by force, fraud or threat and holding them in false imprisonment. Illegal restraint is when a person is kept in captivity by means of any form of physical restraint without the provision of a legal justification. Hostage-taking is the taking of a person in order to force a state or an individual to meet certain conditions such as releasing prisoners or paying of ransom. The FATF defined kidnapping, illegal restraint and hostage-taking as a predicate offence for money laundering in their 40 Recommendations.

The UNODC defines Kidnapping as the unlawful detention of a person or persons against their will for the purpose of demanding for their liberation an illicit gain or any other economic gain or other material benefit; or in order to oblige someone to do or not to do something. Once a person is kidnapped, they become a hostage; Hostage Taking is defined as the act of a person who seizes or detains and threatens to kill, to injure, or to continue to detain another person in order to compel a third party, namely, a State, an international intergovernmental organisation, a natural or juridical person, or a group of persons, to do or abstain from doing any act as an explicit or implicit condition for the release of the hostage commits the offence of taking of hostage.

The International Convention against the Taking of Hostages was adopted by the General Assembly of the UN in 1979 and makes hostage taking an offence.

In 2003, the Trafficking in Persons Protocol aka Palermo Protocol (Protocol to the Convention against Transnational Organised Crime 2000) was enacted to prevent, suppress and punish trafficking in persons. Further to this, in 2004, the Smuggling of Migrants by Land, Sea and Air aka Palermo Protocol was adopted by the UN as supplement to the Convention against Transnational Organised Crime.

Historical Background / Context

Charley Ross a 4 year old boy earned the unfortunate distinction of being the first American to be kidnapped for Ransom in 1874. 2 days after the Kidnap a ransom note demanding US\$20,000 was sent to the family home. Unfortunately following leads the Police searched for and shot dead the suspected Kidnapper before he could be interrogated to locate Charley who was never found.

Whilst the Ross case caused a stir in Philadelphia the kidnapping of the Charles Lindbergh Jr at only 20 months old caused a sensation in 1932. A ransom of US\$50,000 was a paid but no baby was produced. The baby would be found dead 2 months later 7 kms from the family home. The Police eventually located part of the paid ransom and executed burglar and armed robber Bruno Hauptmann for the kidnap and death.

It would take until 1963 before another high profile kidnap case would make the media spotlight, when Frank Sinatra's son was kidnapped from a hotel room and a demand for US\$240,000 was later made. Sinatra with an FBI agent himself delivered the ransom and his son was soon released. The Kidnappers were later caught by the FBI. Sinatra sent US\$2,000 gold watches to the FBI agents involved and to FBI Chief J Edgar Hoover. The former returned them reminding Sinatra they were not allowed to accept gifts. Hoover didn't return his!

Ten years later in 1973 the grandson of perhaps the worlds richest man - John Paul Getty was kidnapped in Rome. The Getty family suspected their grandson may be playing a hoax and they refused to pay the ransom of US\$500,000 believing the sum claimed so small as to be likely to be a stunt. The demand went up to over US\$16mio but still the Gettys refused to pay. J Paul Getty said that "acceding to the demands of criminals and terrorists merely guarantees the continuing increase and spread of lawlessness."

It took the delivery of the cut off ear of the young man before the seriousness of the situation was fully appreciated but even then only US\$3.2mio was paid

and the grandson was returned. The money was handed over in 3 sackfulls of banknotes and was never recovered.

In Italy in 1978, a former Prime Minister and Presidential prospect Aldo Moro was on his way with 5 bodyguards to see the then Italian Prime Minister when his car was ambushed by the Red Brigades, an Italian Terrorist group. All 5 bodyguards were shot and Moro taken. The terrorists demanded the release of 14 Red Brigades members imprisoned in Italian Jails. The Italian government refused to negotiate on principle and Moro was found murdered. Eventually in 1983, 32 terrorists were convicted on various charges connected with the Kidnap and Murder.

In the 1970s up until the early 2000s, South America was the hotspot for kidnappings and Hostage Takings accounting for 65% of all kidnap cases worldwide (4). Groups like the Revolutionary Armed Forces of Colombia (or FARC) and the National Liberation Army (or ELN) thrived on Kidnapping as a source of revenue for their operations. The FARC's most famous kidnapping was of a Colombian politician and French dual national Ingrid Betancourt. Outside of South America, Kidnapping was commonly used to publicize the cause of an insurgency or for the exchange of political prisoners, military prisoners or the release of other opposition members/leaders. Although this type of exchange still exists, for example the Gilad Shalit incident where an Israeli soldier was abducted in 2006 by Hamas and was then released in 2011 in exchange for 1,027 Palestinian prisoners, most of the kidnappings today are of foreign nationals in exchange for an exorbitant monetary ransom demands.

Money Laundering

The shift to Kidnapping as a main source of revenue has gained popularity over the past four to six years and in most jurisdictions the number of Kidnapping is only increasing. The growth is being exacerbated by the emergence of insurance companies that sell kidnap and ransom insurance (or K&R insurance) and by countries that agree to pay ransom demands for their citizens who have been kidnapped and taken hostage. Certain countries have strict, public policies that forbid negotiating with a kidnapper's ransom demands. However the problem remains since most of the ransom demands are negotiated by private, well paid negotiators who are able to coordinate the release of a hostage and the successful payment of the ransom.

Terrorist Groups and other Organised Criminal Gangs have recognised Kidnapping as a viable source of revenue. For instance, the average ransom paid in 2008

to Somali pirates was estimated to be US\$1.25mio. The average ransom paid in 2010 to Somali pirates was US\$5.2mio with ransom payments in excess of US\$9.2mio.¹⁸ The Transitional Federal Government of Somalia is powerless to stop Piracy and hence the Kidnapping of pirated ships and their crew are still taking place off the Somali coast.

Kidnapping have been most rampant in environments similar to Somalis as a FATF report on Kidnapping for Ransom mentioned that most Kidnapping today take place in politically unstable countries where central authority is often weak, public and private corruption is endemic and the social fabric of those nations has unraveled to a considerable degree.¹⁹

Some of the current hot-spots for K&R by Terrorist Organisations are in African Sahel, the Philippines, Pakistan and Afghanistan. In 2012, the average ransom demand by kidnappers in Nigeria was US\$490,000, with the average amount actually paid approx US\$50,000. Recently, the Interior Ministry of Pakistan reported that there were 474 cases of Kidnapping for Ransom in 2010, and 467 Kidnapping for Ransom cases in 2011 with the average ransom demand between US\$500,000 to US\$2.2mio.²⁰ And between 1992 and 2010, militant organisation Abu Sayyaf in the Philippines earned an estimated US\$33mio from Kidnapping foreigners and holding them for ransom.²¹

In the wake of the 11 September attacks on the World Trade Centre and the Pentagon, a report was issued that tried to identify the main source of revenue for Al-Qaeda and other Terrorist Organisations. It was reported that Terrorist Organisations used the drug trade, of mainly opium and cocaine, as one of the main sources of revenue. Fast forward to 2012 and one of the main sources of revenue for Terrorist Organisations is Kidnapping for Ransom.

As reported in Newsweek, since the beginning of the Iraq war according to US government figures, hundreds of foreigners from more than 10 different countries were taken hostage in Iraq. These numbers are small in comparison to the kidnappings of Iraqis, which took place at the rate of 10-30 per day, at one time mainly for purposes of ransom. However, it is not just the Terrorist Organisations that are profiting from Kidnapping. Other groups have started to use Kidnapping to fund their operations, like the Somali Pirates in the waters off the Horn of Africa, Mexican Drug Cartels and Organised Crime syndicates around the world.

According to EU and US government experts Al-Qaeda in the Arabian Peninsula (AQAP) and the Organisation

of Al-Qaeda in the Islamic Maghreb (AQIM) see K&R as a primary source of revenue. The profits gained from K&R by groups such as AQAP and AQIM are usually sent outside the region to other affiliates of Al-Qaeda to help fund their terrorist activities/operations. In 2010, captured financial documents from Al-Qaeda in Iraq (AQI) showed expenditure data with 56% of the profits from K&R going to the funding of AQI operations in other regions.

At the end of 2010, an estimated US\$1.5bio was estimated to have been paid out in ransom to kidnappers around the world,²² posing a real threat to the global financial system. Of that total, US\$180mio was paid to Somali pirates where 80% of the ransoms are in the form of physical cash and delivered in bulk cash by air drop off the coast of Somalia with the average payout at almost US\$5mio. These bulk cash payments pose large problems for law enforcement who attempt to track the money. For one, the ransom payments often do not result in bulk cash disclosures/declarations and/or suspicious transactions reports to the Financial Intelligence Units. Additionally, once the cash is in the hands of the pirates and the ransom payment is divided to the individuals who helped coordinate the attack, the profits are occasionally put into real estate purchases in northern Somalia or in neighboring Kenya. The FATF report on Maritime Piracy says there is debate about whether pirates based in Somalia use Hawalas, with some experts suggesting that most hawaldars cannot handle the amount of cash that ransom payments bring in.²³ However, some law enforcement believes that ransom payments could be moved through Money Services Businesses (including informal MSBs such as Hawalas). For more details on MSBs including Hawalas see Part 1, Section 2, Sub-section 2.

The FATF report on Kidnapping for Ransom analyzed K&R cases involving Terrorist Organisations and one fact was prominent throughout. The formal financial system and banks in particular, played a surprisingly significant role. The reason for the bank's role is the victim's family or the victim's representative are located in developed areas with sophisticated banking systems, which gives them the ability to pay a large ransom demand. Therefore, the FATF report believes that banks may be at risk for placement and transmission of ransom payments. Excluding the Somali pirates, cash still played a significant role in these K&R cases. Unfortunately, when terrorist demand the ransom payment be made in cash the money trail grows cold after a short time and to further complicate the matter the Kidnapping can occur in one jurisdiction but the ransom may be paid in another.

At the recent G8 Summit hosted by the UK in June 2013, the hosts included a proposal to stamp out ransom payments as many are considered to fund terrorist groups. Up to US\$70mio is estimated to have been paid to free western hostages in the last 3 years, at an average of US\$2.5mio for each captive. Whilst the UK already outlaws such payments, other countries such as France, Italy and Japan are suspected of still allowing such payments though agreed at the G8 Meeting as a G8 announcement to ban such payments going forward.

The fact that some G8 Western citizens are targeted is thought to have a lot to do with both the price that can be obtained and the reaction that a kidnaping receives. Whilst an agreement to refuse to pay ransom demands is one approach another not adopted could have been suggested by at least one of the G8 members.

A leading western hostage negotiator has for example claimed that some countries have taken a much more aggressive approach, recounting a claim about a Hezbollah kidnaping of a Russian. In response the Russian security service's response was to allegedly find one of the kidnap-gang relatives, cut off his private parts and send it to the kidnappers. "Unsurprisingly they got the hostage back." said the negotiator.²⁴

In response to the threat of kidnap, the demand for kidnap and ransom insurance (K&R) in recent times has been good. Many of the worlds biggest companies now have some K&R coverage for their staff. Plans typically cover the costs of ransoms, the hiring of consultants and negotiators, lost earnings and other costs. The insurance policy doesn't pay the ransom, but pays out to the Insured if a ransom is paid by the company or on its behalf. The market in 2006 was estimated to be worth approx US\$250mio in 2006 which has since doubled in size by 2011. Still insurers report the market is shifting. Somali piracy has dropped off; there have been no documented successful hijackings since May 2012. And although the number of attacks in the Gulf of Guinea overtook those of the East Africa in 2012, quieter shipping lanes there mean fewer potential customers. Yet new markets are opening up. In Africa, India and Latin America the middle class has been growing—and so has the worry about being kidnapped. For instance, "express" kidnapings are on the rise, negotiators report. Unlike the protracted kidnap the new version entails fast, targeted grabs, followed by shorter periods of detention and smaller ransoms.

Market Manipulation

"the traders had been "knuckleheaded"

Former Citi Chairman and CEO Chuck Prince, 2004, following the revelations surrounding the so called "Dr Evil" trades which resulted in a large fine and censure¹

Introduction

The trading volumes in global markets, equities, securities, commodities foreign exchange and derivatives markets have grown dramatically throughout the 20th Century, providing ever more opportunities for those that seek to profit from illegal fraudulent activities.

In many parts of the World, initially in the West, but now beyond, Markets have been relied upon to drive economic growth. There are many hundreds, if not thousands of examples though, through the years of significant abuses perpetrated on market participants, including investors, that have unfairly disadvantaged the abused and undermined the integrity of the markets involved, including manipulating behaviour. A number of these events, which proved most damaging, led to increased governmental intervention to regulate so called free markets.

For those involved regularly in the Markets including professional market participants, they must rely on the legitimacy and integrity of these Markets for their own trades and for those of their customers. Professional Market Participants therefore have a special responsibility to ensure the continued legitimacy and integrity of these Markets, to ensure their own actions, nor those of their clients amount to a manipulation, rather they should contribute to Market integrity by having strong, clear policies and effective controls to protect both own reputation and that of the Markets themselves.

Harms

Market Manipulation is both a theft and a financial Fraud. The victims are all those market participants that play by the rules, investing honestly. The abuser when he manipulates cheats every other participant and offends the principles of the Markets that honest participants rely upon.

Markets need to be organised in a way that encourages all investors to trust that they will be treated fairly. Any appearance that the markets allow some to trade using an unfair advantage against investors at large will harm that trust and discourage participation in those markets.

The public cost, which is the harm done to the integrity of the market and to confidence (i.e. perceptions of the integrity of the market), can lead to changes in broader market behaviour and pricing, and flow on into other adverse effects on the economy.

Conceptually, the public cost of market abuse including manipulation can be expected to be seen in the first instance in a widening in the bid - ask spreads for all trading in the securities in question. This can spill over into widening bid - ask spreads in the market for all securities, an increase in the cost of capital and a reduction in the market price of securities - not only for new and existing issues of the security in question but also for other securities. A reduction in market depth (reflecting reduced willingness to trade) and reduced trading volumes could also be expected.

These higher costs of capital and costs of trading could feed into lower returns on investment, less fixed capital spending and less potential and actual economic demand and activity over the economic cycle.

Unless they are caught and punished adequately, market abusers and manipulators themselves do not incur much of these economy-wide costs. The conduct also creates a negative externality. Securities prices in the market are distorted and consequently other buyers and sellers end up paying for inefficiencies in the market as a result of the offender's conduct.

Statistics

Whilst there are few statistics available to demonstrate the size and scope of manipulative activity and their consequences, recent fines announced with more likely to follow with respect to the Libor Scandal demonstrate the potential harm that can result, particularly where collusive practices appear to be at work.

Outside of the Libor Scandal, there were also suspicions that manipulative actions may also have played a role in creating the financial crises of 2007.

Whilst it is widely accepted that the underlying causes of the crises were the weaknesses in the US Housing and mortgage sector, the existence of "Bear Raids" just prior to the autumn of 2007 suggests that it too may have contributed to the crises.

The crises to date has resulted in widespread economic damage and questions over the very nature itself of market themselves. The US Financial Crises Inquiry Commission (FCIC)² reported³ that over 26 million Americans were unemployed or underemployed by early 2011 and that nearly US\$11 trillion in household

wealth had evaporated. The FCIC also concluded that the crises though was avoidable and was caused in part by “widespread failures in financial regulation and supervision that proved devastating to the stability of the nations financial markets.”

Annual enforcement statistics provided by the SEC from 2003 to 2012 show a total number of enforcement cases across all manner of violations, including insider dealing, Market Manipulation and others, rising in 2003 from 679 to 734 in 2012. Insider dealing and Market Manipulation made up; 50/32 and 58/46 cases respectively.

Definition/Description

According to the UK's FSA as set out in their Code of Market Conduct³ (August 2009),³ Market Manipulation is included within the definition of Market Abuse that includes (i) insider dealing and improper disclosure, (ii) misuse of information, and (iii) market manipulation including: (a) manipulating transactions, (b) manipulating and “fictitious” devices, (c) dissemination of information, and (d) misleading behaviour and distortion. This effectively applies EU law as set out in the Market Abuse Directive, which is expected to be updated and reissued as MAD 2. For more details see Part 1, Section 3, Money Laundering Laws & Regulations. As for Insider Dealing the US relies on broad anti-fraud provisions contained in the federal securities laws, e.g., Section 10(b) of the Securities Exchange Act of 1934 and Rule 10b-5. For more information see Insider Dealing above. FATF have included market manipulation alongside insider dealing as a predicate offence for money laundering in their 40 Recommendations.

Historical Background / Context

For a comprehensive history of market abuse as it applies to both Insider Dealing and Market Manipulation see Inside Information above which is not duplicated here.

Money Laundering

Market manipulation is the practice of interfering in the market by manipulating transactions, using manipulating and “fictitious” devices, disseminating false or misleading information or by undertaking distorting or misleading behavior. Manipulators and abusers have included regulated financial institutions, but more often rogue employees, as well as lightly or unregulated ones, including Hedge Funds and in particular of concern are Boiler Rooms. For more details see Part 1, Section 1, Fraud, incl Tax Fraud and Cybercrime.

Top Major Market Manipulation Techniques	
1	Abusive Rate Fixings / Intimidation / Co-ordination
2	Abusive Short Selling
3	Abusive Squeezes / Cornering / Warehousing
4	Banging / Marking the Close / Marking the Open / Portfolio Pumping
5	Bear Raids / Short & Distort / Trash & Cash
6	Front Running / Parallel Trading / Piggy Backing / Tailgating
7	Late Trading / Market Timing
8	Layering / Spoofing
9	Painting the Tape
10	Ping Orders
11	Pump and Dump / Hack Pump & Dump / Ramping / Scalping
12	Quote Stuffing
13	Rumoring / Puffing
14	Wash Trades / Circular Trading / Pre-arranged Trading / Soft Dollar Arrangements
15	Large and Unusual orders, including unusual order price, size etc

Source: Author

Both Boiler room operators and other rogues will use common schemes and techniques to make money unfairly and illegally in the securities markets, as did Stratton Oakmont using Pump and Dump schemes involving Penny Stocks. The following are brief summaries of these and many more abusive and manipulative practices, schemes and techniques.

Abusive Rate Fixings (Intimidation/Co-ordination)
The submission of rates at unrepresentative levels with the aim of distorting the respective benchmark which they are used to calculate. Following the revelations around the Libor and other benchmark interest rate fixings, by a number of rate setting Investment Banks that colluded to manipulate rates to benefit their own trading positions, rule changes are expected to ensure that manipulation around the setting of these rates are expressly covered by Market Abuse legislation / regulation going forward. Despite a lack of express regulation covering rate setting, a number of individuals involved are facing criminal prosecutions. The Libor benchmark interest rates are used to set an estimated US\$800 trillion-worth of financial instruments. For more details see Libor Bid Rigging Scandal in Part 2, Section 8, Enforcement Cases below.

Abusive Short Selling (See Short and Distort, Trash and Cash).

Abusive Short Selling involves short selling a stock while smearing the company with rumours to drive the stock price down, essentially the opposite of pump and dump.

Abusive Squeezes (see Cornering)

The ability to manipulate the supply or demand for an investment through the holding of a significant position. Where the owner of the security tries to distort the price at which others have to deliver, take delivery or defer delivery to satisfy their obligations.

Amends

High numbers of trade amendments, often with a large P&L impact are used by rogue traders as a way of masking their fictitious or fraudulent trading activity.

Backing Away

A backing-away occurs when a market maker firm fails to honour its obligations in a given security to honor the quoted bid and ask prices for a minimum quantity. This requires a market maker to execute an order “presented” to it at a price at least as favorable as its published quotation up to its published quotation size. A market maker’s obligation to fill an order begins generally at the time the order is “presented,” regardless of how the order is transmitted to the market maker.

Banging the Close

Where a trader, for example, buys or sells a large number of futures contracts during the closing period of a futures contract in order to benefit an even larger position in an option, swap, or other derivative that is cash settled based on the futures settlement price on that day.

Bear Raids (see Short and Distort and Trash and Cash)

Bear raids can be an illegal market practice where investors take a short position in a stock, disseminate negative news and then collectively sell borrowed stock. They profit by buying shares to cover their borrowed positions at a lower price.

Best Execution (See Excessive Mark Ups)

Brokers must obtain best execution for customers and must not charge customers excessive fees.

Bucketing

Where a broker executes a customer’s order for his own account instead of on the market, with the hope of profiting from a beneficial transaction at a future time.

Bucket Shop

Originating in the late 19th century, bucket shops

were a trading venue for the man on the street set up in rudimentary premises such as a café or hotel, akin to a betting shop, where an internal market was made for bets to be placed on stock prices. These days the term can be used to describe small, independent online spread-betting companies.

Cancellations

See Amends, trade cancellations are often used alongside trade amendments for the same purpose.

Capping

Effecting transactions in an instrument underlying an option shortly before the option’s expiration date to depress or prevent a rise in the price of the instrument.

Cherry Picking

Where a broker or investment manager takes all the beneficial trades for himself, rather than offering those trades to customers.

Churning

The excessive buying and selling of securities in a customer’s account by a broker for the purpose of generating commissions.

Circular Trading (see Wash Trades)

A fraudulent trading scheme where sell orders are entered by a broker who knows that offsetting buy orders, the same number of shares at the same time and at the same price, either have been or will be entered.

Cornering (see Abusive Squeezes)

Securing such relative control of a commodity that its price can be manipulated, that is, can be controlled by the creator of the corner.

Crossing Trades (see Wash Trades)

These are transactions where both buy and sell orders are entered at, or nearly at, the same time, with the same price and quantity by the same party, or different but colluding parties.

Curb Trading

Trading by telephone or by other means that takes place after the official market has closed and that originally took place in the street on the curb outside the market.

Directed Trading (see Soft Dollar Arrangements)

This is the practice of a fund adviser sending trades to a specific broker-dealer for execution (“directing” the trade), often in exchange for some benefit to the advisor, such as additional shelf space for its products. The broker-dealer gains because it receives the commissions from placing the trades (the “brokerage”). This practice

can create a conflict of interest between the investment advisor and the investor because the advisor may be tempted to direct trades to the broker-dealer that sells the most of the advisor's fund's shares, rather than the broker-dealer that provides the best execution or best price for trading.

Fictitious Orders (see Phantom Orders)

A trade that is designed to look as though a trade has been entered but has not been executed in fact.

Front Running

When a broker trades on the basis of non-public information about an impending trade. For example, if a broker knows a client is selling a large amount of stock in a particular company, enough such that the price of the stock will likely fall, the broker could sell or short that stock before executing the client's sale.

Ginzy Trading

A trader, in executing an order, particularly a large order, fills a portion of the order at one price and the remainder of the order at another price to avoid exchange's rules against trading at fractional increments or "split ticks."

Hack, Pump & Dump (see Pump & Dump)

In this form a person purchases penny stocks in advance and then uses compromised brokerage accounts to purchase large quantities of that stock. The net result is a price increase, which is often pushed further by day traders seeing a quick advance in a stock. The holder of the stock then sells his stock at a premium.

Insider Dealing/ Trading

The buying or selling of a security by someone who has access to material, non public information about the security.

Inter-positioning

Interposing another party between a trader itself and the market in a manner inconsistent with best execution requirements in particular inter-positioning can result in fraud where it results in the charging of excessive and undisclosed markups".

Intimidation/Coordination (Abusive Rate Fixings)

Coordinating its prices (including quotations), trades, or trade reports with other traders; directing or request another trader to alter a price (including a quotation); or engaging, directly or indirectly, in any conduct that threatens, harasses, coerces, intimidates, or otherwise attempts improperly to influence another member. This includes any attempt to influence another member to adjust or maintain a price or quotation and refusals

to trade or other conduct that retaliates against or discourages the competitive activities of another market maker or market participant.

Laddering

This refers to the practice where, a broker for example, in the context of an IPO, requires IPO investors to buy shares at higher prices in the after-market as a condition for receiving lower priced shares in earlier allotments.

Large and Unusual Orders

Trades of significance that are large and/or unusual when viewed against the ordinary course of business and/or versus the market.

Late trading

Late trading is the practice of placing orders in securities, for example, mutual fund shares after regular market hours, for example (a mutual fund will calculate its net asset value typically at 4:00 p.m. In New York for US funds), and so this practice can enable traders to capitalize on market-moving information which is released after the close of regular trading.

Layering (see Spoofing)

Multiple orders are submitted at different prices on one side of the order book slightly away from the market prices. This gives a false impression of the demand prompting a move in the share price.

Excessive Mark-ups

Excessive mark ups, or charging a customer a price significantly over the fair market price, for example whilst a trader is entitled to make a profit mark ups of 35% over the market price are very likely excessive. Undisclosed mark-ups in excess of 10% are potentially excessive too.

Marking the Close

Attempting to influence, for example, the closing price of a stock by executing purchase or sale orders at or near the close of the market..

Marking the Open

Attempting to influence, for example, the closing price of a stock by executing purchase or sale orders at or near the open of the market.

Matched Order

Matched orders are orders to buy or sell a security while entering (or knowing another person is entering) an opposite order for the same security at the same time and price, with the aim to give an impression of increased volume.

Momentum Ignition

Initiating or enhancing a trend through the aggressive placement of orders in the hope that others will follow, which creates an opportunity to reverse a position.

Naked Short Selling

Where a trader sells short a security without owning, or having arranged to borrow, the security. Firms normally locate securities available for borrowing prior to effecting a short sale in any security for its own account or the account of any customer, even if the short position is to be closed out by purchasing securities the same day.

Painting the Tape

An illegal action by a group of manipulators buying and/or selling a security among themselves to create artificial trading activity. The reference to the tape is a reference to the tape which was a running public display of market prices.

Parking

When parking shares, firms are attempting to cover undeclared short positions left over from transactions whose stock was not delivered by the settlement date. Rather than performing a buy in transaction, these firms collude with one another and by delaying the settlement process, inflate the number of shares available for trade in the secondary market.

Penny Stocks

Whilst Penny Stocks are a legitimate security to want to own, they are also vulnerable and often used in a number of common Manipulation schemes; including, **Cornering; Pump and Dump**, including the **Hack Pump & Dump**, followed by the **Short & Distort** otherwise known as the **Trash and Cash**. Such schemes use low priced securities ("Penny Stocks") that do not trade on major exchange, but rather Over The Counter (OTC) or on Bulletin Boards (In US as Pink Sheets). These stocks are more susceptible because: i) they typically have a low trading volume, ii) in some jurisdictions, there is no regulator or they are exempt from filings, iii) large amount of shares (control of float) can be obtained cheaply or fraudulently, and iv) trading can increasingly be done through internet-based accounts and private shell companies. The same principle applies in the UK, where target companies are typically small companies on the AIM or OFEX. In 2009, FATF in its report, Money Laundering and Terrorist Financing in the Securities Sector,⁴ identified Penny Stocks as a specific concern for Money Laundering/Terrorist Financing vulnerabilities because they are often used by criminal organisations to generate illicit assets through market manipulation, insider

trading, and fraud; and can be acquired by investing illicit assets into a company that is about to become public as a way of laundering funds.

Phantom Orders

A trade that is booked with an execution date far in the future, and is adjusted to include the correct settlement and trade date when the transaction is completed.

Piggy Backing

When a broker or adviser buys or sells a security for a client and then immediately makes the same transaction in his or her own account.

Ping Orders

The entering of small orders in order to ascertain the level of hidden orders and is particularly used to assess what is resting on a dark platform or within dark pools.

Ponzi Scheme (see Fraud above)

Ponzi scheme is an investment fraud that involves the payment of purported returns to existing investors from funds contributed by new investors. Ponzi scheme organisers often solicit new investors by promising to invest funds in opportunities claimed to generate high returns with little or no risk.

Portfolio Pumping (see Marking the Close)

The illegal act of bidding up the value of a fund's holdings right before the end of a quarter, when the fund's performance is measured. This is done by placing a large number of orders on existing holdings, which drives up the value of the fund.

Pre-arranged Trading

Trades where an offer to sell is coupled with an offer to buy back, or where an offer to buy back is coupled with an offer to sell, at the same price or some other pre-arranged price that benefits the dealers or brokers engaging in the pre-arranged trading.

Puffing (see Rumouring)

Subjective, usually extraordinary, claims as to the merits of something, including a security, with little or no basis

Pump and Dump (see Hack Pump and Dump)

A scheme that attempts to boost the price of a stock through recommendations based on false, misleading or greatly exaggerated statements. The perpetrators of this scheme, who already have a position in the company's stock, sell their positions at the higher share price. Pump and Dump schemes usually target micro and small cap stocks (see Penny Stocks above), as due to the small float of these types of stocks it does not take a lot of new buyers to push a stock higher.

Quid Pro Quo Arrangements

For example Laddering or purchases or participation in future offerings by a client (so-called “tie-in” agreements), or the receipt of excessive compensation for other services provided.

Quote Stuffing

The submission of a large volume of orders to the market with the intention of slowing down the trading systems of other traders or market participants or hiding one's own strategy.

Ramping

The practice of trying to boost the price of a share and the company behind it by buying the securities in the market with the object of raising demand. If the price rises, the ramper may be able to make a quick profit by selling

Rumouring (see Puffing)

Disseminating false or misleading information about companies. Rumours have generally been considered unsubstantiated unless verified by an appropriate official of the company they concern.

Scalping

Scalping is when a broker, analyst, or other securities professional recommends that an investor buy a security and then sells that security at a profit immediately after the recommendation has been disseminated and investors have driven the price of the security up with their purchases.

Selective Issuer Disclosure

Where issuers of securities selectively disclose material, non-public information to analysts, institutional investors, and others, without also disclosing it to the public generally. Where disclosure is made intentionally, the issuer must “simultaneously” disclose such information to the public and where information is disclosed unintentionally, such information must “promptly” be disclosed to the public.

Short and Distort (see Abusive Short Selling and Trash and Cash)

When traders manipulate stock prices in a bear market by taking short positions and then using a smear campaign to drive down the target stocks.

Snake Trading

Searching order books in an attempt to find market orders for securities in which no bid or ask prices exist and then subsequently entering bid or ask prices that significantly vary from the normal market price of those securities.

Soft Dollar Arrangements (see Directed Trading)

Arrangements where investment advisers are given certain benefits (such as research) from a broker-dealer in exchange for the adviser directing trades to that broker-dealer for the broker-dealer to execute for a fee. These arrangements may generate a conflict of interest in some cases between the adviser's clients' interest in cheap and efficient brokerage services and the adviser's desire to use a broker that provides the most benefits to the adviser.

Spinning

Where investment advisers allow preferred customers to purchase shares in initial public offerings of stock (IPOs).

Spoofing

The entering of orders to create the impression of liquidity in a stock when the trader's actual intention is ultimately to trade in the opposite direction. The initial orders are then quickly cancelled or withdrawn, with the trader then making real trades if prices have moved to the trader's advantage.

Trade Shredding

Splitting any order into multiple smaller orders for execution, or any execution into multiple smaller executions for transaction reporting for the primary purpose of maximizing a monetary or in-kind payment or the transaction reporting of such executions.

Trash and Cash (see Abusive Short Selling and Short and Distort)

Involving the circulation of damaging information about a share that has recently been sold, with the intention of repurchasing it at a lower price.

Tailgating

Similar to front running, this is a practice that involves a broker buying or selling a security for his / her client and then immediately placing the same trade on his / her own account.

Tipping

Providing material non public information to another individual in breach of a fiduciary duty or other similar duty of trust, for the purpose of allowing the “tippee” to profit from the tip.

Unauthorised Trades

Broker-dealers entering into orders without the expressed and detailed permission of the customer unless the firm has been granted written discretionary authority by the customer.

Unsuitable Trades

A broker-dealer must have reasonable grounds for believing each recommendation to a customer is suitable on the basis of the customer's other securities holdings and financial situation, among other factors.

Unusual Order Price

Placing a sizeable order in a security at a price that is materially higher or lower than the bid / ask in order to inflate or deflate the market price of that security.

Warehousing

Holding a sizeable portion of a security / commodity in order to create an artificial shortage in the market which can benefit the holder when the excess demand causes a spike in the price.

Wash Trades (see Circular Trading)

Trades involving no change in beneficial ownership; i.e. buying and selling the same number of shares at the same time at the same price—often to artificially increase the reported volume of trading in that security (in practise there may be small variances across both size and price). It should be noted that in a number of cases investigated during the [Libor Scandal](#) wash trades were used to facilitate unauthorised payments to brokers as rewards for their efforts to manipulate Libor.

Vulnerable Markets and Notable Cases

Many of these schemes have been employed on the equities markets, focussing on a particular stock, so that individual actions can have an effect, for example three of the most notorious of America's so called [Robber Barons](#); [Daniel Drew](#), [Jay Gould](#) and [Jim Fisk](#) were serial manipulators at a time before rules were established as were [Michael Meehan](#); [Charles Mitchell](#); [Richard Witney](#); all who would become infamous due to their activities before during and after the [Stock Market Crash of 1929](#).

Despite regulation, there have been plenty of examples of manipulators who seek to make money for themselves unfairly at the expense of others, using techniques of old and applying them to new models, markets and investors.

It is also possible to manipulate and use many of the schemes seen above beyond individual equities, to securities and to particularly securities markets and their derivatives even though the larger the market the harder it is to manipulate.

There are also, beyond the securities markets cases where serious manipulation has been attempted for example in the Commodities and Precious Metals markets, for

example by [Yasuo Hamanaka](#) who attempted to corner the copper market in the 1990s and before him the [Hunt Brothers](#) who tried a decade or more earlier to do the same in silver. These markets work in similar ways to the securities markets and are regulated in a similar way. For example, market participants may attempt to illegally manipulate the market for a commodity by such actions as fraudulently reporting price information or cornering the market to artificially increase the price of the targeted commodity. This is of particular concern when it affects delivery of the underlying commodity which may be needed by commercial enterprises for their business activities. For notable examples see the cases of [Lui Qibing](#); [Yasuo Hamanaka](#); the [Hunt Brothers](#); and [Christopher Pia](#).

Whilst some markets appear too big to manipulate, for example the foreign exchange markets, sometimes to the disappointment of Central Banks who are legally entitled and do still try, in order to try to manage their exchange rates, the conventional wisdom that some markets are therefore free of manipulation or rules and regulations, monitoring and surveillance is not required needs a reality check particularly as we see from the [Libor Bid Rigging Scandal](#). For details see Part 2, Section 8, Enforcement Cases below.

Major cases include those best known from history including way back to the [Tulip Bubble](#) bursting in 1634, followed by the bursting of the [South Sea Company](#), [William Duer](#), [London Stock Exchange](#) hoaxes of 1814, NY State Senator [Kimble](#) in the 1840s, the [Robber Barons](#) including [Daniel Drew](#) and [Others](#) and the [Stock Market Crash of 1929](#). More recently also in the 1970s with the [Hunt Brothers](#), Michael Milken in the 1980s followed by [John Kaweske](#), the [Flaming Ferraris](#), the [California Electricity Crisis](#), [Shell](#), [Ken Mahaffey & Others](#), [Simon Eagle](#), [Christopher McQuoid](#), [Dipak Patel & Others](#), [David Mason](#) and [Christopher Pia](#). For more details see Part 2, Section 7, Criminal Cases, Market Abusers below. Most recently the action against [Panther Energy Trading](#) for market manipulation was announced in connection with High Frequency Trading. For more details see Part 2 Section 8 Enforcement Cases below.

Murder & Grievous Bodily Injury

"Murder is unique in that it abolishes the party it injures, so that society has to take the place of the victim and on his behalf demand atonement or grant forgiveness; it is the one crime in which society has a direct interest"

W. H. Auden, English Poet

Murder is perhaps the single most serious criminal offense and is one of the oldest crimes since the beginning of organised society. Every major religious text forbids the act of murder with the exception of warfare, capital punishment, self defence, etc. The threat of violence to a person or their loved ones is a persuasive technique used by Organised Criminal Gangs to run and fund their criminal enterprises and to keep those involved silent on the details. Intimidating and scaring people with the risk of torture and ultimately the loss of their lives is an act of terrorism that is used by Terrorist Groups in the hopes of bringing about religious, political or other changes to society.

Harms

When a person is murdered, the affects are felt immediately by the surrounding community. However, when the victim is a Political Leader, the affects can be felt by an entire society. The murder of a senior public official, is usually described as an assassination (murder with a political motivation).

Since murder can have a profound affect on society, the act of murder on community leaders or public officials is commonly used as a tool to sway public opinion. When an assassination is carried out, it is usually not planned by a solitary individual but rather it is conspired by a group of individuals with a political, religious, ideological or military motive, including Organised Criminal Gangs and Terrorist Groups know and understand the affects on society of murder and use it to further their own criminal or terrorist agendas.

Another particular group of professionals that are threatened with murder or bodily harm are journalists. The International Federation of Journalists reported in 2010 that almost 100 journalists were murdered because of their work.¹ Professionals in this industry, especially investigative journalists, are under constant threat (in certain countries) because of their work. Whether their work focuses on corruption in government or ties to organised crime, their work makes them prime targets for attacks by the criminals and corrupt politicians which they seek to expose.

Statistics

A study by the Geneva Declaration on armed violence and development titled *Global Burden of Armed Violence* includes a chapter that tries to apply a quantitative approach to measuring the affects of "intentional homicide" (as they refer to murder) and the number of intentional homicides that occur each year.² The report admits that statistics on intentional homicide rarely capture the number of actual criminal events that have occurred since these crimes can be reported by relatives and witnesses, but obviously cannot be measured through reports by victims. Statistics should therefore be assumed to be conservative estimates. The latest statistics in that study are from 2004 and it estimates that the world average is 7.6 homicides per 100,000 of the population.³

Murders - by Country

Country	Murders
1 Brazil	43,909
2 India	40,752
3 Mexico	20,585
4 Ethiopia	20,239
5 Indonesia	18,963
6 Nigeria	18,422
7 South Africa	16,834
8 Russian Federation	15,954
9 Columbia	15,459
10 US of America	15,241

Source: UNODC (United Nations Office on Drugs and Crime) 2012

The UNODC produced the 2011 Global Study on Homicide, which is a collection of statistical data covering 207 countries and territories. The Study shows that young men, particularly in Central and South America, the Caribbean and Central and Southern Africa, are at greatest risk of falling victim to intentional homicide but that women are at greatest risk of murder owing to domestic violence. There is evidence of rising homicide rates in Central America and the Caribbean, which are "near crisis point" according to the Study. Firearms are behind rising murder rates in those regions, where almost three quarters of all homicides are committed with guns, compared to 21% in Europe. Men face a much higher risk of violent death (11.9 per 100,000 persons) than women (2.6 per 100,000 persons), although there are variations between countries and regions. In countries with high murder rates, especially involving firearms, such as in Central

America, 2% of males aged 20 will be killed before they reach the age of 31 - a rate several hundred times higher than that in some parts of Asia. Worldwide, 468,000 homicides occurred in 2010. Some 36% of all homicides take place in Africa, 31% in the Americas, 27% in Asia, 5% in Europe and 1% in Oceania. Honduras had the highest rate per any country covered by the Study at 82.1 per 100,000.⁴

who is convicted of murder may be sentenced to many years in prison, a prison sentence with no possibility of parole, or even the death penalty. The stiff penalties for committing the crime have undoubtedly deterred many murders; however the deep emotions that a murder creates can be seen as an effective tool to Organised Criminal Gangs and Terrorist Groups, whereby no penalty is too great.

Grievous bodily injury is the intentional infliction of a life-threatening injury or serious injury of a person, or on an important organ or limb of another, makes an important organ or limb unusable, makes another permanently unfit for work, infirm or mentally ill, or the badly or permanently disfigurement of the face of another. This is the Swiss law definition, but as there is no global definition, each jurisdiction has its own. The FATF defined grievous bodily injury as a predicate offence for money laundering in their 40 Recommendations.

Historical Background / Context

Few events have the capability of changing the course of human history as do the murders (or assassinations), of highly popular politicians, civil rights leaders or other influential figures. The immediate societal impact such high profile murders create is what separates this crime from others. Hopes for the future can be crushed immediately, uncertainty sets-in instantly and the backlash of such murders can have consequences that last for generations, even outcomes that couldn't be foreseen or expected.

Here are some of the best examples, all great moments and times in World History:

When those in the Roman Senate led by Brutus assassinated Julius Caesar, in 44 BC intent on defending the Republic from in their eyes a dictator, they little expected that a civil war would follow and that they as the conspirators would be defeated and then would rise a new Political dynasty under Caesar's nephew Octavian, who would become the great Augustus, which would mark the end of Rome once and for all as a Republic, but led to its greatest successes as an Imperial Nation.

Fast Forward to The French Revolution in 1789, with the French people rising up against an absolute monarch, King Louis XVI, and the assault on the Bastille and the passage of the Declaration of the Rights of Man and of the Citizen culminating in the founding of a Republic in 1792 with King Louis XVI being executed in 1793. These momentous times led to Wars in Germany, Holland and Belgium and Italy

and brought in Robespierre and virtual dictatorship by the Committee of Public Safety during the Reign of "Terror" from 1793 until 1794 during which between 16,000 and 40,000 people were killed, where this early use of the word was most definitely State sponsored. Not long after the fall of the Jacobins and the execution of Robespierre, Napoleon Bonaparte would come to power in 1799. The modern era has unfolded in the shadow of the French Revolution. Subsequent events that can be traced to the Revolution include the Napoleonic Wars, two separate restorations of monarchy (Bourbon Restoration and July Monarchy), and two additional revolutions (1830 and 1848) as modern France took shape.

Most Notorious Assassinations over last 100 years	
1914	Archduke Franz Ferdinand
1918	Tsar Nicholas II
1922	Irish President Michael Collins
1940	Leo Trotsky, Russian Communist Leader
1948	Mahatma Ghandi
1963	US President J F Kennedy
1968	US Civil Rights Leader Martin Luther King
1968	US Senator R Kennedy
1973	Spanish PM Luis Blanco
1975	Saudi King Faisal
1978	Italian PM Aldo Moro
1979	Lord Louis Mountbatten (Queen's cousin)
1981	Egyptian President Anwar Sadat
1984	Indian PM Indira Ghandi
1986	Swedish PM Olaf Palme
1991	Indian PM Rajiv Ghandi
1993	Sri Lankan President R Premadasa
1995	Israeli PM Yitzhak Rabin
2001	Nepalese King Birendra
2003	Serbian PM Zoran Dindic
2005	Lebanese PM Rafic Hariri
2009	Pakistan PM (Fmr) Benazir Bhutto

Source: Author See Part 2, Section 6 below

On 9 April 1865 General Robert E. Lee, General of the Southern Confederate Army, surrendered to the Union Government of America ending the American Civil War. Four days later President Abraham Lincoln was attending a performance at Ford's Theatre when

John Wilkes Booth, a Confederate sympathizer and an opponent of the abolition of slavery, entered the presidential booth and shot Lincoln in the back of the head. President Lincoln died the next morning. His death had an instantaneous effect on the people in both the Northern and the Southern States. His death deepened the hatred and the vindictive attitudes of the North towards the South which legitimized the rational for the extremist sentiment and actions of the President's party who wanted to punish Southern states after the war. In addition to the Congressional backlash in Washington D.C., Lincoln's assassination had direct and devastating affect on the South's reconstruction process. Many historians argue if Lincoln hadn't been assassinated, the reconstruction process would have been quicker and the oppression of African-Americans may have narrowed greatly. President Abraham Lincoln was the first US President to be assassinated and John F. Kennedy was the last US President to be assassinated. Both assassinations had an equally chilling affect on the American people's psyche and caused great uncertainty.

President J F Kennedy was murdered at a pivotal time in US history. The assassination took place in November 1963, a year after the Cuban Missile Crisis, an event that brought the world near the brink of nuclear disaster. The civil rights movement, led by Martin Luther King Jr had gathered momentum and was meeting fierce resistance, especially in the South. The Kennedy administration was also in the midst of an unprecedented war on organised crime, led by his brother Robert who was the US Attorney General. The President had many enemies, many of whom wanted him dead. There was great confusion during the first hour after President Kennedy was shot. Since the shooting took place at the height of the Cold War, theories started to take form that the US was under attack from the USSR. One of the only people who may have had knowledge of 'why' President Kennedy was assassinated was the alleged assassin himself, Lee Harvey Oswald, who was murdered two days after Kennedy's assassination. To this day, the level of uncertainty of who assassinated President Kennedy still exists, giving birth to conspiracy theories that would plague the US for decades. These difficult times for America's were only compounded with the assassinations of Presidential hopeful, Robert Kennedy and Martin Luther King Jr in 1968.

Whilst the assassinations of Lincoln and Kennedy had an enormous impact on the US psyche, they didn't lead to a dramatic change in events in either the US or beyond.

That can't be said for the assassination of little known

Archduke Francis Ferdinand, heir to the Austro-Hungarian Empire, whose murder triggered more devastation and loss of life than any before it or since. In June of 1914, Archduke Ferdinand was killed by an assassin's bullet in Sarajevo. Austria-Hungary was searching for a reason to launch a pre-emptive war against Serbia and with the assassination of Archduke Ferdinand, Austria-Hungary was able to secure the promise from Germany that it would aid in a war with Serbia. Due to the existing treaties between the global powers at the time, Austria-Hungary's declaration of war caused a chain reaction that pulled every global power into the First World War. As a result, over 9 million military personnel lost their lives and over 20 million were wounded. The number of civilians who lost their lives has been estimated to be over 6 million. The First World War precipitated the Russian Revolution in 1917 and the execution of the Tsar Nicholas II, leading to the rise of Lenin and the Bolsheviks, then Stalin in Russia and the Soviet Republics and Mao later in China. Of course the end of the First World War and the terms for German Surrender fed German support for Adolf Hitler and the Nazi's leading to World War 2, where many more millions of lives were lost, and would lead historians to conclude that the Twentieth Century was easily the bloodiest in time immemorial.

Whilst death is of course the most severe injury that can be meted out, other punishments and bodily injuries can cause great harm and have significant effects.

Whilst many organised criminal groups have their own modus operandi, many are based on or reflect traditional state sponsored forms of punishment, for example, the so called Five punishments in China date back to ancient times, and included: tattooing, cutting off the nose, amputation of one or both feet, castration and of course death. Later these changed to penal servitude, banishment, death, or corporal punishment in the form of whipping with bamboo strips or flogging with a stick. Fines could also be administered in addition. For women, they could be forced to grind grain, have their fingers squeezed between sticks, be beaten with wooden staves, sequestration or confinement to a room and to be given permission to commit suicide.

When it comes to death, man has tried many ways, many of them vying to be the most gruesome, many state sponsored including Beheading, Stoning, Boiling Alive, Hanging, Hung Drawn and Quartering, Burning, Crucifixion, Garrotting, Drowning, Electrocution, being Shot, Blown Up and or Poisoning which are copied in various ways by organised crime gangs.

Beyond these most final of punishments, Mutilations and various forms of punishment beatings are commonplace with some gangs having very specific modus operandi, for example the IRA, engage in kneecapping, which is where several men force one individual to the ground and set about him. His legs and arms are held taut, the knees smashed by repeated blows, or else a gunman shoots the pinned victim through the kneecaps, perhaps also the elbows. Occasionally the legs have to be amputated.

Victims are beaten or shot in front of their families, dragged into alley-ways, snatched off the street into passing cars.

Money Laundering

Whilst terror organisations will employ murder as part of their raison d'être so would organised criminal gangs who also may carry out attacks on public officials, community leaders or journalists, perhaps under an illegal contract to carry out the attack. These individuals are referred to as "Contract Killers". The illegal contract is usually given to local criminals who are then compensated with cash. The prices for contract killers varies from some of the cheapest in India and Mexico from US\$35 to, for example, US\$700,000 paid to three ex-soldiers to murder a US DEA agent.

Beyond terrorist organisations and organised crime, there are State sponsors of murder with examples such as was the case of Slobodan Milosevic who ordered the assassination of Serbian President Ivan Stambolic by Special Operations Unit officers and the case of Abdurahman Alamoudi who was contracted to kill the Saudi Crown Prince Abdullah by Colonel Gaddafi of Libya. Of course, many of the dictators described as kleptocrats were also involved in the state sponsorship of murder.

Augusto Pinochet, one of the most corrupt and most prominent money launderers in South America's history was eventually placed under arrest because of allegations of murder rather than of corruption or money laundering. This did lead to the identification of a network of accounts and other assets held at a number of US financial institutions particularly Riggs Bank. The investigation found at least US\$27mio had been illegally obtained and transferred through a network of trust funds and shell corporations.

Organised Crime

"Criminals are motivated by profit: so let us go after their money."

Antonio Maria Costa, Executive Director, United Nations Office on Drugs and Crime in 2010¹

This is a popular refrain which has been at the forefront of global policies to defeat organised crime for more than 20 years. Mr. Costa, also stated that "We must increase the risks and lower the incentives that enable the bloody hand of organised crime to manipulate the invisible hand of competition"

After Osama bin Laden was killed in 2011, the head of an organised criminal gang became the most wanted man in the world. Joaquín Guzmán Loera (El Chapo) is the leader of the Mexican Sinaloa Cartel, that controls a significant part of the drug trade into the US who also earned the title as "the world's most powerful drug trafficker." Whilst the Sinaloa Cartel jealously and violently defends its interests it both competes and works with other Organised Gangs both in Mexico and around the world. The existence of Organised criminal gangs on every continent in virtually every country remains a significant threat to society.

Harms

Organised crime is considered as one of the major threats to society, both in threatening citizens physical security and in the pursuit of serious crimes which undermine legitimate business, corrupt political and legal structures and in so doing undermine the development of and effective functioning of societies worldwide.

Statistics

According to the UNODC Report issued in October 2011, money flows related to transnational organised crime activities represented approximately US\$870bio the equivalent of some 1.5% of Global GDP, 70% which or 1% of Global GDP or US\$580bio is thought to have been available for laundering through the financial system. The largest income for transnational organised crime comes from illicit drugs, accounting for a fifth of all crime proceeds. According to UK authorities,² the total cost of the social and economic harm caused to the UK by serious organised crime is in the region of £30bio a year. Its victims range from those whose lives are ruined by drug addiction, to women who are trafficked for sexual exploitation, to businesses who suffer losses from fraud or are forced to close in the face of illegal competition.

In Italy, organised crime generates up to US\$204bio (turnover) every year according to Conteserati (Italian Employers' Federation) also stated the Italian Mafia has US\$83bio in liquidity. Around 270,000 businesses in the country associated with the Federation reported being subjected to 1,300 crimes a day by organised crime gangs

Definition / Description

Organised crime gangs come in different shapes and sizes, appearing in many forms at different times and in different places, exerting different levels of organisation, geographic coverage and criminal focus. According to the US Organised Crime Control Act 1970, Organised crime is the "unlawful activities of a highly organised, disciplined organisation," and according to the UN Convention against Transnational Organised Crime 2000 (the Palermo Convention) a "structured group of three or more persons, existing for a period of time and acting in concert with the aim of committing one or more serious crimes or offences, in order to obtain directly or indirectly, a financial or other material benefit.³ According to the UNODC, transnational organised crime largely focus on the trafficking of drugs, in persons (including for sexual exploitation), smuggling of firearms, trafficking of natural resources (such as timber, and wildlife, including elephant ivory, rhino horn and tiger parts, product counterfeiting (including counterfeiting of medicines) maritime piracy and cyber crime. Whilst their activities are illegal they do in large part respond to a reasonably large demand for certain services from parts of the community. As globalization has expanded international trade, so the range of organised criminal activities has broadened and diversified to whatever makes them money or where they can gain influence or control. Today's leading organised criminal gangs operate internationally and often with each other, though great enmities and rivalries exist too. Organised Criminal Gangs operate using the clear threat of violence and incentives, also corruption as a persuasive technique both to ensure order within the Gang but also to encourage third party compliance or support when appropriate.

As Organised criminal gangs generate so much money, they need to launder this money on an industrial scale and invest time and effort into disguising and converting it into funds that are then available for investment into legitimate enterprises or into valuable assets that are not traceable back to the original criminal proceeds. The gangs will use violence and the threat of violence and incentives including bribery as persuasive techniques both to ensure order in the gangs but also to protect and to expand their operations.

Historical Background / Context

The term "organised crime" appears to have emerged in Chicago in 1919, gaining traction through the era of prohibition and through the exploits and ultimate demise of one of the Worlds most notorious criminals, Al Capone. But the phenomenon of organised criminal activity far pre-dates this and its manifestations have developed considerably since that time. One of the first recorded were "thugs" or gangs of criminals, who terrorised 13th century India moving from town to town, looting and pillaging and of course later in the piracy on the high seas, highwaymen and banditry were to the pre-industrial world what organised crime is to modern society. Many of today's leading organised criminal gangs also have long histories, many tracing their origins back to feudal times, retaining links and codes from a bygone era whilst at the same time modernizing and expanding their operations far beyond their traditional roots from their homelands across the world.

Money Laundering

Money Laundering theory, based on largely studying Organised criminal activity, suggests that as OC groups generate very large amounts of money, this money becomes much more valuable to them if they can disguise it and convert it into funds that are available for investment into legitimate enterprises or into valuable assets that are not traceable back to the original criminal proceeds. Money Laundering is a three-stage process: Placement: (also called immersion), generally inserting crime funds into the legitimate financial system; Layering: disguising the trail of the monies as they pass through the financial system, so the monies cannot be linked to criminal proceeds and also called 'heavy soaping' and finally Integration (also called 'spin dry'), when the funds make it into legitimate income or assets. As many of the leading organised criminal gangs are involved in a material way in drug trafficking, and indeed many have made their names and branched out following success in trafficking drugs, the methods and networks used by these organised criminal gangs will be largely those used by those drug traffickers.

OCs will use Banks and other Financial Institutions for all manner of services including moving, using and storing and other non-Bank operators such as, for example, Money Services Businesses as well as informal channels such as unregulated money transfer systems, non-financial operators, such as cash intensive businesses, for example, Casinos or retail outlets to launder monies and others such as Real Estate Agents, Precious Metal Dealers and High Value Goods Dealers in items like, Art, Planes, Boats and Cars.

Examples of particular Banking services that are particularly attractive to support organised criminal activity, include of course Private Banking services. This service is attractive in order to manage significant criminal proceeds for investment or privacy purposes usually via various front companies, trusts or foundations established by specialists, for example Lawyers, Fiduciaries and Company Service Providers.

Another service is the cash, cheque and other payment services offered by Banks that enable OC Gangs to move and launder their money, sometimes over great distances internationally, via Correspondent Banking. Good examples would be the cases of Lucy Edwards and Peter Berlin which led to criticism at the Bank of New York, Pedro Allatore working at Casa De Cambio Puebla in Mexico City helping one of the Mexican Drug Cartels launder money via Wachovia Bank and through HSBC.

Money Services Businesses are a frequent target for OC gangs trying to launder money, with Beacon Hill and Lespan as well as Sigue Corporation also good examples. As are Precious Metals and Stones Dealers, with La Mina and Operation Polar Cap and Speed Joyeros very good examples.

A favourite method used in particular by Drug Trafficking Organisations is the Black Market Peso Exchange utilised by the Colombian Cartels as a trade base money laundering system. For details see Drug Trafficking and Smuggling above.

Organised Crime, including gangs, will also smuggle cash. For details see "Smuggling" below.

When it comes to the use of Cash Intensive Businesses few were more useful than Casinos, with the Italian American Mafia sending Bugsy Malone to Las Vegas to establish their first Casino. The Italian American Mafia like many other Organised Criminal Gangs have used many front businesses to launder cash, with cash generating businesses popular, with perhaps the best example being Al Dente's Pizzeria in New York City which was raided by the FBI following the undercover work of the real Donny Brasco and which case became known as the Pizza Connection.

Organised Criminal gangs can be found in most countries in the world with the most successful exploiting key points of interest along the value chain of the most profitable criminal industries whether drugs, people or products and in origin transit and destination countries. Concentrations do appear in many of the Worlds largest and most successful Countries and Cities,

where trade, demand and opportunities abound.

There are no government published lists covering the Worlds Organised criminal gangs, nor are there many rankings of organised criminal gangs where membership size, success in generating proceeds, harms caused etc are collected and made available, though there are many private publications relating to one or more gangs and a number of authors that have tried to collect information on some of the most important. One ranking list was identified as follows:

10 Most Dangerous Gangs in the World	
1	Mara Salvatrucha (MS-13)
2	Latin Kings
3	Aryan Brotherhood
4	Los Zetas
5	18th Street Gang
6	Bloods
7	Yakuza
8	Wah Ching
9	Crips
10	Cosa Nostra

Source: Wiki, National Geographic⁴

The following is a brief summary of the regions and key countries in the world where Organised crime is a significant threat and highlights the most important Organised criminal gangs known to be operating. The gangs and groups include mafia type organisations, street gangs, prison gangs and other gangs that are involved in substantial collective criminality. Profiles for these and other Organised Criminal Gangs are set out in Part 2, Section 5, Criminals & Terrorists.

Africa

Africa is home to only a number of major organised criminal gangs, including the People Against Gangsterism and Drugs and the Numbers Gang in South Africa, the Mungiki in Kenya and in Nigeria, the Nigerian 419 and other Fraud gangs and the Area Boys. The lack of organised criminal gangs, compared to other regions is probably a result of limited opportunities, tribal allegiances and state domination in much of Africa.

Middle East

With the continued struggles and conflict in the Middle East and the number of terrorist organisations calling the Middle East home, organised crime is largely

crowded out or otherwise its these groups that can be considered organised criminal gangs. Classic organised criminal gangs can be found still in Israel, for example, the Abergil Crime Family, the Alperon Crime Family and the Zeev Rosenstein Organisation. And in Turkey for example, the Turkish Mafia and the Ulkucu Hareket.

Golden Crescent

In the region known as the Golden Crescent, in particular centred on opium production in Afghanistan and in neighboring Pakistan, Afghan Warlords still operate, one such group is the Afriди Network but also of note is the Khan Cartel and the Haqqani Network. Of course many of the terrorist organisations in the region including the Taliban also operate as organised criminal groups to fund their activities.

India/Pakistan

In India and Pakistan, the D Company is the most significant of the organised criminal gangs. In Mumbai D Company has competition from Chhota Rajan, Arun Gawli, Late Amar Naik and Chhota Shakeel.

Asia

Golden Triangle

In South East Asia, the area in and around the Golden Triangle, (Thailand, Myanmar and Laos) is particularly attractive to organised criminal gangs as an area that produces large amounts of heroin, including the Khun Sa cartel (see also Mong Tai Army); and the United Wa State Army; The Red Wa operate in Myanmar and originally part of the Burmese Community Party's military. Jao/Chao Pho are ethnic Chinese gangs in Thailand. In the Philippines they have become the second largest producers of Marijuana in the world after Mexico and an important transit point for other drugs in the region and so alliances have been formed that involve the 14K Triad, the United Bamboo, the Heavenly Alliance and the Four Seas gang all of Taiwan, the Big Circle Boys and the Yakuza.

China

In China, the Triads, whose history may go back as much as 2000 years, played a major role in the Chiang Kai-shek regime gradually increasing the scope of their criminal activities, but they were enemies of the Communists and had to flee after the Communists came to power in 1949. The Triads left settling mostly in Hong Kong, but also Macau and in Taiwan and also represented in countries with significant Chinese populations, such as Malaysia, Singapore, the US, Canada, Australia and the UK. There are around 50 known triad societies in Hong Kong alone, the main ones being the Sun Yee On and 14K which are the two

largest and well known but other large gangs include Wo Shing Wo, Wo Hop To and Wo On Lok, are also important. In Taiwan, the United Bamboo is believed to be Taiwan's top Triad gang. Other Taiwanese gangs include Heijin, Heavenly Alliance and the Four Seas. The Dai Huen Jai are not a Triad gang but a Chinese criminal gang and the Tongs are similar to triads except that they originated among early immigrant Chinatown communities independently, rather than as extensions of modern triads.

In Oceania, organised crime has focussed its attentions on the regional economic power of Australia but also New Zealand. Gangs in Australia often form on ethnic lines, and there are Chinese Triads, Japanese Yakuza and Vietnamese gangs, but also include Lebanese, Italian, Romanian and even Colombian Syndicates. Of the Triad groups the 14K is well established in Sydney with branches in the other major cities. Also active are the Big Circle syndicate. In Melbourne as well as those already mentioned are the Sun Yee On and the Wo Yee Tong and the Wo Shing Wo. The latter two are sub-groups of the Wo Group. Outlaw motorcycle gangs are present in Australia, with international outlaw clubs like the Bandidos and Hells Angels and Gypsy Joker as well as locals such as the Coffin Cheaters, the Comanchero, the Nomads, the Notorious and the largest the Rebels. Youth Gangs have flourished throughout many of the large cities of Australia, especially Melbourne and Sydney, but also more recently throughout the outer suburbs of Brisbane as well. There have also been a few cases of Australian gangs imitating American street gangs such as the Bloods, including gangs such as Butch Lesbian Soldiers (BLS), Village People and FLC.

In New Zealand organised crime is largely carried out by motor cycle and street gangs, and criminal elements of the Asian community. The Hells Angels (Auckland) was in fact the first chapter established outside California (1961). Also two other US groups, The Bandidos and the Outlaws also have interests on the Islands. The Asian community in New Zealand has increased dramatically in the last decade as a result of increased immigration and has unwittingly brought with it gangs such as 14K, Sun Yee On and the Wo groups. Other groups emanate from Thailand, Vietnam, Malaysia, Singapore and Japan. The Maoris have also formed organised gangs with the most important being The Mongrel Mob, Black Power and Nomad gangs.

Japan

In Japan, the Yakuza dominates through its main syndicates, the Yamaguchi-gumi; the Sumiyoshi-kai; the Inagawa-kai; the Dojin-kai; and the Kyushu Seido-kai.

Americas

The US and Mexico are homes to some of the worst organised crime problems in the world. The contiguous land border between the two has enabled a significant flow of criminal activity between the two states and organised crime is increasingly penetrating the legitimate business world for both laundering purposes and the movement of merchandise with illicit products hidden within. Canada has also been effected, by its proximity to the US and by its relatively open border.

United States of America

Whilst we are all familiar with the Prohibition era in the US when the fame of gangsters such as Al Capone and Bugsy Malone grew, and since, as Hollywood has portrayed these times as particularly dangerous, the problems of organised crime are today much worse. Al Capone's Chicago has also to a large degree been superseded by New York, Los Angeles, Dallas and Miami not only because of their local mobs but because they are key entry points for the drugs and cash in need of laundering, arriving from Latin America and South East Asia. Whilst classic organised criminal gangs such as the Italian American Mafia, in particularly La Cosa Nostra remain, though much less powerful after continued targeting and successful prosecutions, and the rise of new competitors, they do remain still important, particularly in some Eastern Seaboard cities. They include such groups as the Bonanno, Colombo, DeCavalcante, Gambino, Genovese and Luchese families. The other Italian Mafia groups are also present in the US though not as significant, including the Comora, the Ndranghetta and the Sacra Corona Unita.

The landscape has changed however and the one that exists today includes many important players, including street gangs, prison gangs and other gangs that work closely with Mexican and other foreign organised criminal gangs to supply illegal drugs and other goods and services to the worlds biggest and most wealthy market. Mexican's as well as South American Gangs, including the Colombians as well as Japanese Yakuza and the Chinese Triads, the Russian Mafia and Albanian Mafia as well as home grown Outlaw Motorcycle Gangs. The Triads are considered a major problem, with close 'business' links to the Mafia, they flourish in the 'Chinatowns' of San Francisco, Los Angeles, Portland, Denver, Houston, Phoenix, Chicago, Boston Philadelphia, Atlantic City and New York. As well as the usual crimes it is estimated that with their Hong Kong and Taiwanese links the Triads are responsible for much of the world's forged credit cards. They are also connected to violent street gangs such as the 'Ghost Shadows' or 'Flying Dragons'. The Japanese Yakuza are prominent in Hawaii with significant holdings

in real estate. Jamaican Posses are involved in Drugs distribution as are Nigerians who use a route from Latin America through West Africa to then bring drugs into both Europe and North America.

Perhaps the most troubling though of all the developments is the rise of Russian and Eastern European including the Russian Mafia, Chechen Mafia and Albanian Mafia who are involved in tax and health care fraud, alien smuggling, extortion, drugs, and of course money laundering. As many of these started out in contract killing they are particularly violent groups, with little regard for traditional gangland rules.

Much of the proceeds of crime are generated in cash and a wide variety of methods is used by gangs to launder the money. Much is hidden until it can be smuggled out to another destination where it can be released into the local economy. Increased use is also being made of the casa de cambios of Latin America, the Hui Kwan and Chop Houses of East Asia / Hong-Kong and the Hawala and Hundi systems of South Asia and Middle East. The non-bank system includes insurers, mortgagees, trading companies, gold and precious metal dealers, cheque cashing services express delivery services, etc. Wire transfers can hide criminal proceeds in the vast numbers and amounts going through the financial system and as such is one of the most important instruments for layering illegal proceeds in terms of the volume of money that can be moved and the extent to which transfers occur.

Clearly the US, in a global economy, is facing the globalisation of crime and criminal organisations. Its northerly neighbour Canada and its southerly neighbour Mexico are integral to this global criminal economy, which are part of, as well as being under attack from, foreign criminal groups that easily rival the inheritors of the American mobster. Beyond the classic organised crime gangs lies a more dangerous phenomena, being the American Street and Prison Gangs. Approximately 1.4 million active street, prison gang members, comprising more than 33,000 gangs, are criminally active within the USA. This represents a 40% increase from an estimated 1 million gang members in 2009, with Arizona, California, and Illinois with the highest number of gang members.

The main Prison Gangs in the US are the Aryan Brotherhood, Mexican Mafia, La Nuestra Familia and the Texas Syndicate.

The most notorious American street gangs have been formed from the streets of major cities like Los Angeles, which have spawned the Crips and the Bloods, Mara Salvatrucha -13 or MS-13 and the 18th Street Gang, the

Latin Kings and Wah Ching, and the Black Guerrilla Family (Black Family, Black Vanguard).

Whilst the Hell's Angels are the best known of all the so called "Outlaw Motorcycle Gangs", the Outlaws, the Bandidos and the Pagans, make up the top 4 biker gangs with other gangs the Mongols, the Vagos Motorcycle Club and the Wheels of Soul, each of which stake claim to territory in North America, and in Europe, particularly in the UK, Scandinavia and elsewhere, even in Australia. Membership is as high as 44,000 in the US with approximately 3,000 gangs or sub gangs in total.

Of the far right groups in the US the Ku Klux Klan still remains the most notable.

Mexico

Mexico's geographical position set between the world's largest cocaine producers and one of the world's biggest consumers of cocaine making it a logical transit route for the product. Mexican Drug Trafficking Organisations (DTOs) are essentially transport and logistics organisations who are competing for the business of supplying the US with marijuana and cocaine supplied by indigenous, Central American and South American producers, and, in the case of Ephedra based products; China.

The DTOs are located in specific geographic areas within Mexico. The Cartels are located in those areas along Mexico's border with the US and in its Gulf, Caribbean and Pacific ports. Some are also located on the connecting highway routes between these points.

Mexican criminal gangs include the Sinaloa Cartel, Los Zetas, Gulf Cartel, Tijuana Cartel, Beltrán Leyva Cartel, Juarez Cartel and the Knights Templar Cartel, each control large swaths of Mexican territory and dozens of municipalities. There were no cartels in the 1980s in Mexico, as the entire business was controlled by one man, Félix Gallardo who was known as the "Godfather".

The cartels are currently waging violent turf battles over control of key smuggling corridors through Mexico and defending themselves from government action. The Sinaloa cartel is considered the largest and most powerful drug trafficking organisation in the world and fugitive Joaquín Archivaldo Guzmán Loera is its leader. Known as "El Chapo Guzmán" ("Shorty Guzmán") for his 1.68m (5ft 6in) stature, he became Mexico's top drug kingpin in 2003 and is now considered, "the most powerful drug trafficker in the world," by the US Department of the Treasury. Los Zetas is considered the

most violent.

Mexican cartels are also increasing their relationships with prison and street gangs in the US in order to push market distribution. A US Congressional report noted that gangs such as the Latin Kings and Mara Salvatrucha (MS-13) buy bulk methamphetamine from Mexican drug cartels for resale. Again, according to the FBI, Mexican cartels focus only on wholesale distribution, leaving retail sales of drugs to the street gangs. The cartels will sell to all and any gangs but do not take sides in US gang turf wars.

Caribbean

Of the 16 countries in the Caribbean area four have been identified by President Obama as major drug producing or transit countries. These are Haiti and the Dominican Republic, the Bahamas and Jamaica.

Jamaica

Jamaican organised crime is the most powerful in the region and is present in the cities of the US, Canada and the UK and Canada. The major crime groups are deeply involved in the international drug trade and within Jamaica protection rackets and extortion. They have penetrated the formal economy in both legitimate and illegitimate businesses. They have massive political influence with corruption endemic. The Posse's as they are known in the Americas or Yardies as they are known in the UK are loose groupings of gangs first became involved in drugs and gun-running in the early 1980s and have been described by some as an example of organised disorganised criminals. The most well known is the Shower Posse.

Central America

Central America consists of the seven states of Belize, Honduras, Guatemala, Costa Rica, Nicaragua, and El Salvador with a combined area smaller than Texas. Today organised drug crime has increased its already substantial presence and widened its activities. It is now the main cause of the bloodshed within Central America which is used as a bridge between Colombia and Mexico and from there onwards to the US.

These problems are even more acute in the so called Northern Triangle of Guatemala, El Salvador and Honduras.

Indigenous gangs have existed for decades moving drugs, contraband, humans, and arms but now the Mexican Cartels have moved in as drug flights from South America into Mexico becomes more difficult and seaborne interdiction more effective on the Caribbean and Pacific routes into Mexico and the US.

Most of the organisations that participate in drug trafficking in the Northern Triangle are tasked primarily with the protection and transportation of Colombian or Mexican-owned products. One example of this relationship is the Mexican Sinaloa Cartel's links with Los Perrones Orientales, an organised crime group that transports product by land from the Pacific Coast to Guatemala. Another part of the organised crime structures are youth gangs. There is evidence that the upper echelons of transnational youth gangs, such as the Mara Salvatrucha (MS13 and MS18), provides security, or "muscle," for the Mexican cartels and frequently provide transport services for organisations like Los Perrones Orientales. These upper levels are often made up of former combatants from former conflicts in the region.

The other main Mexican cartel, Los Zetas are attempting to recruit senior Mara 18 members. They also recruit from the notorious disbanded Guatemalan Special Forces known as the Kabilas. Mara 18 is the local name of the 18th Street Gang that originated in Los Angeles in the US and came to the region when gang members were deported from the US back to Central America. There are an estimated 70,000 maras in Central America. These youth gangs are a ready supply of willing teenagers who can ferry drugs, look after kidnap victims and carry out other low-level crimes although they run large scale protection racket.

South America

Of all the Countries of South America Brazil, Colombia and Venezuela have the biggest problems with organised Crime.

Brazil

In Brazil criminal gangs are dispersed and usually based on the favelas with control being exercised by the use of terror. The organisations are directed exclusively at the business of drugs and weapons. Unfortunately this is not all as some sectors of the various Policing groupings are accomplices of organised crime. In Rio de Janeiro, the Blue Command and the Red Command can be found and in São Paulo a group known as PCC or First Capital Command dominates the massively overcrowded prisons and is also a significant threat outside.

Colombia

Colombia has long epitomized drug cartels and decades long terrorist/insurgent struggles. The Country is home to terrorist groups such as FARC, the ELN and the AUC, although the AUC has been largely disbanded although some are said to have reformed or even become part of the Colombian Government forces.

These groups also operate in ways similar to those involved in organised crime. Colombia remains the world's leading producer of cocaine, controlled by the Colombian Drug Cartels. In the late 1990s and into the first decade of the twenty first century, three-quarters of the world's annual yield of cocaine was produced in Colombia, both from cocaine base imported from Peru and Bolivia, and from locally grown coca.

The Colombian Drug Cartels are criminal organisations developed with the primary purpose of promoting and controlling drug trafficking operations. During the 1980s, as demand for cocaine increased, existing Colombian Drug Cartels expanded and organised into major criminal conglomerates usually headed by one or several kingpins as in the case of the Medellin Cartel led by Pablo Escobar and the North Coast Cartel, led by Alberto Orlandez-Gamboa "Caracol" (the snail) along with federation-style groups such as the Cali Cartel (founded by the Rodríguez Orejuela brothers, Gilberto and Miguel, as well as associate José Santacruz Londoño) and the Norte del Valle Cartel (Founded by Diego León Montoya Sánchez, Wilber Varela and Juan Carlos Ramírez Abadía).

With the collapse of many of these major Cartels, a new organisation, Norte del Valle Cartel, became established and inherited much of the drug trafficking operations, though the establishment of a military wing and infighting have produced "Los Rastrojos" as one of the most important drug trafficking groups in Colombia and beyond. Other Cartels, albeit not as powerful, do exist including the Cartels in Bogota, Caqueta, and Llano, as well as more than 300 additional drug smuggling organisations or 'Cartelita's' (baby cartels).

Other organisations in Colombia are also involved in drug trafficking including paramilitary or terrorist groups which use the provides of drug trafficking to finance their activities. These include the AUC, Black Eagles, ELN, FARC, ERPAC, Oficina de Envigado, Los Paisas and Los Urabeños. All the groups currently running the country's drug trade are known collectively by the government as "criminal bands," or BACRIMs

Venezuela

Venezuela's long porous borders with Colombia and Brazil and an island dotted coastline facing the Caribbean Islands has made it a major player in the illicit drugs industry. Whilst Colombian gangs have long since operated in Venezuela, often dominating organised criminal activity, and having a permanent presence in the cases of both the Revolutionary Armed Forces of Colombia (FARC) and the National Liberation Army (ELN), just as Mexicans have eclipsed

their Colombian criminal counterparts over the last decade, there is evidence that Venezuelans are moving in the same direction. For example whilst the Colombians traditionally controlled the flow of cocaine through Venezuela to organisations in Mexico and Europe, they are being replaced by Venezuelan gangs who buy cocaine as it crosses the border then sell it on to transnational criminal organisations, principally the Mexicans, but also the Italian Mafia. Evidence suggests that most of the Venezuelan gangs have ties to, or are directed by, members of the Venezuelan military. The term "Cartel of the Suns" (Cartel de los Soles) is used to describe groups inside Venezuela's military that traffic cocaine.

Eastern Europe

Eastern European gangs include the Russian Mafia including the Solntsevskaya Bratva in Moscow and the Tambov Syndicate in St Petersburg, the Chechen Mafia including the Obshina and the Albanian Mafia, for example Nono Aldo Bare, the Serbian Mafias, and the Pruszkow Mafia in Poland.

Western Europe

Western Europe is home to numerous organised criminal gangs including probably the most infamous of them all, the Mafia in Italy, including the Cosa Nostra in Sicily, the Comorra in Naples, the Ndrangheta in Calabria and the Sacra Corona Unit in Puglia. In the Netherlands, the Bruinsma Drug gang operate, in France, there is the Corsican Mafia and the Horne Gang, in Sweden the Original Gangsters and the Uppsala Mafia and Black Cobra, in Denmark. In the UK the Clerkenwell Crime Syndicate also known as the Adams Family and Curtis Warren, and in Ireland the Gilligan Gang and the Foley Gang.

For more details see Part 2, Section 5, Regions, Countries, Criminals & Terrorists.

Smuggling

"Smuggling organisations are opportunistic and for the right price could knowingly or even unknowingly use their smuggling techniques, routes and methods to smuggle dangerous criminals, weapons, drugs, contraband or worse into this country."

Brian Moskowitz, US Immigration and Customs Enforcement (ICE)¹

Harms

Smuggling severely harms the economy of a country in multidimensional ways. It undermines the local industry, discourages legal imports and reduces the volume of revenues collected from duties and levies by the state. Unfortunately smuggling reaps huge benefits for criminal organisations and terrorists alike. In a report released by the World Customs Report, titled Tobacco and Cigarette Smuggling, it was determined in the case where goods are highly taxed, easily portable and penalties remain relatively light for smuggling, transnational criminal organisations will take advantage of any weaknesses in customs, revenue or other border controls to amass profits.²

Not only is smuggling illegal but certain types such as trafficking for the purpose of modern day slavery or sexual exploitation is also a crime against humanity.

Statistics

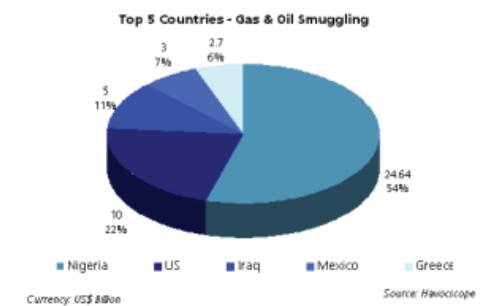

According to Havocscope, the Top 5 Smuggling activities are as follows:³ smuggling, which can take the form of alcohol (US\$5bio), cigarettes (US\$50bio), oil and gas (US\$37.25bio) as well as wildlife (US\$19-32bio), metals and minerals (US\$2.3bio), nuclear smuggling (US\$100mio) and human smuggling (US\$35bio), could amount to almost US\$1.62bio. Nevertheless, wildlife smuggling could be more appropriately included in Environmental Crime and human smuggling in Human Trafficking. Without these, smuggling estimates fall to US\$95bio. This ranks it fourth or fifth as a result in overall black market activities depending upon which is included.

Gas & Oil

In June 2012, officials with oil companies and the Nigerian Government reported that over US\$1bio in oil revenue were being lost to the oil being stolen. In 5 months, security services in Nigeria shut down over 900 illegal oil refineries across the country.⁴ Reuters reported that a legislative committee estimated the annual revenue loss in Nigeria due to the black market smuggling of fuel was US\$4bio.

According to the Maritime Industry Advocacy Initiative in 2011, 600,000 barrels of oil is being lost in Nigeria each year, which puts the annual losses to oil smuggling at around US\$24.6bio. In 2011, the Mexican government-controlled oil producer Pemex reported losing 3.35 million barrels of fuel to oil smugglers. In

2010, the company lost 2.16 million barrels of fuel. The estimated losses for the company in revenue to oil theft and smuggling is around US\$1bio. The oil theft has a severe impact on Mexico's federal budget, as profits from Pemex pays for one-third of the government's federal budget.⁵ The Top 5 Countries for Gas and Oil smuggling are as follows:⁶

Cigarettes

Cigarette smuggling causes US\$50bio in lost tax revenue to governments around the world, according to the World Health Organisation in March 2012. At least 10% of all cigarettes sold in the world were smuggled on to the black market.

In 2011, an estimated 65 billion cigarettes were smoked in the EU that were smuggled and purchased on the black market. The black market cigarettes caused a loss of tax revenue of US\$1.2bio for the EU budget and up to US\$11bio in lost tax revenue for EU member states.

In New York City, where the combined state-local tax rate is US\$5.85 a pack, up to US\$40mio a year in tax revenue is lost to cigarette smuggling. A NYC wide sweep of 1,700 stores licensed to sell cigarettes found that 42% of stores were either selling untaxed cigarettes or packs of cigarettes with counterfeit tax stamps on them.⁷

A similar annual estimate for losses was provided when the head of a domestic cigarette manufacturer in Jamaica said that cigarette smuggling in the country causes the government to lose between US\$34mio and US\$45mio.⁸

The Government of Greece loses up to US\$654mio to cigarette smuggling activities each year as 170mio black market cigarette packs are sold within the country.

Wildlife Smuggling and Poaching

According to Europol, the trafficking of endangered species is worth US\$32bio, with the EU being the foremost destination for these species and Europol and Interpol involved in countering this trade.⁹

Endangered Animals & Wildlife Prices	
Arowana Fish	US\$20,000
Baby Elephant in Thailand	US\$7,000
Baby Tiger in Iran	US\$3,200
Bear Bile	US\$200,000 per pound
Black Cockatoo	US\$31,000 in Australia
Clouded Leopard	US\$5,700 in China
Elephant	US\$28,200
Elephant Tusk	US\$1,800 in Vietnam
Full Dead Bear	US\$2,500 in Taiwan
Geckos from New Zealand	US\$1,300 in Europe
Gorillas	US\$40,000
Iguanas	US\$10,600
Ivory	US\$1,800 per kilo
Komodo Dragon	US\$30,000
Orangutan	US\$45,000
Ploughshare Tortoise	US\$4,000
Polar Bear Skin	US\$7,760 - US\$9,930
Rhino Horn Dagger	US\$14,000
Rhino Horns	US\$97,000 per kilogram
Shark Fins	US\$400 per pound
Snake Venom	US\$215,175 per litre
Snakes (Banded Kraits)	US\$2,190 in India
Snow Leopard Pelt	US\$1,000 in Afghanistan
Tiger (Dead)	US\$5,000
Tiger (Live)	US\$50,000
Tiger Remains	US\$70,000 in China
Tiger Skin	US\$35,000
Tortoises	US\$10,000 in Madagascar
Turtle	US\$20,000 in China

Source: Havocscope¹⁰

The World Wildlife Fund (WWF) estimated the global illegal trade in Wildlife as worth US\$19bio, much of which is used to finance criminal conflicts.

Alcohol

BBC News reported in 2011 that alcohol smuggling leads to US\$1.6bio in lost tax revenue to the UK government. The illicit sales of spirits alone causes US\$490mio in tax revenue losses.¹¹ Frontline reported in 2007 that alcohol smuggling in Iran brings in

US\$2.5mio a day.¹² The Industry Association for Responsible Alcohol Use reported that alcohol smuggling in Canada causes losses of US\$734mio every year.¹³

Top 10 Countries – Alcohol Smuggling		
1	UK	US\$1.6bio
2	Iran	US\$912.5mio
3	Canada	US\$734mio
4	Russia	US\$700mio
5	Thailand	US\$334mio
6	Colombia	US\$300mio
7	Malaysia	US\$268mio
8	Turkey	US\$60mio
9	US	US\$34mio
10	Cambodia	US\$22mio

Source: Havocscope¹⁴

Metals & Minerals

In South Africa, Peru and the Democratic Republic of Congo, illegal gold trafficking creates a yearly loss of US\$2.3bio a year, according to a report by Global Financial Integrity (February 2011).¹⁵

Illegal mining groups in Colombia are reported to be paying 1% of their total production in extortion fees to paramilitary groups such as the FARC, who generate up to US\$1mio a month from illegal mining activities. The Mine Minister of Colombia estimated that at least 40% of all mining activities in Colombia in 2011 were unlicensed.¹⁶ The drug trafficking and paramilitary organisations control at least 30% of the illegal mining activities.¹⁷

Custom officials in India reported seizing 48,600 crates of conflict diamonds in Surat and Mumbai in 2011. The crates of diamonds did not have the proper Kimberly Process Certification and were believed to have been smuggled out of Zimbabwe. The diamonds were worth US\$1.75mio. Up to US\$1bio in potential revenue from the extraction of diamonds in Zimbabwe was reported to be missing as of 2011, according to the country's Finance Minister and civic leaders. 10 out of 11 diamonds sold around the world are cut in India.¹⁸ For more information see Precious Metals & Stones.

Definition / Description

Smuggling is the underground transportation of goods or persons, such as out of a building, into a prison, or across an international border, in violation of applicable laws or other regulations. It also involves the importing or exporting without paying lawful customs charges or duties. Smuggling is also defined as international trade through 'unauthorised route' such as a seaport, airport or land port which has not been authorised by the gov-

ernment for importation and exportation. Smuggling is a cognisable offense in which both the smuggled goods and the goods are punishable.

There are various motivations to smuggle. These include the participation in illegal trade, such as in the drug trade, in illegal immigration or illegal emigration, tax evasion, providing contraband to a prison inmate, or the theft of the items being smuggled.

Historical Background / Content

Smuggling dates back to probably the first time duties were imposed, or any prohibitions were placed on imports or exports. In England it first became a recognised problem in the 13th century, following the creation of a national customs collection system. The export of highly taxed export goods such as wool and hides were smuggled, as well as goods such as grain to circumvent prohibitions or embargoes on particular trades. Imports of wine were also sometimes embargoed during wars to try to deprive the French of the revenues that could be earned from their main export.

Again, taking England as an example, in the mid-16th century, the illicit export of goods like grain and leather represented a significant part of British business, with many members of the civic elite engaging in it. Grain smuggling by members of the civic elite, often working closely with corrupt customs officers, has also been shown to have been prevalent during the later 16th century. Wool was smuggled into England in the 17th century under the pressure of high excise taxes. The high rates of duty levied on tea and also wine and spirits, and other luxury goods coming in from mainland Europe at this time made the illegal import of such goods and the evasion of the duty a highly profitable venture for impoverished fishermen and seafarers. In certain parts of the country, the smuggling industry was more economically significant than legal activities such as farming and fishing. The principal reason for the high duty was the need for the UK government to finance a number of extremely expensive wars with France and the US.

Smuggling in colonial times was a reaction to the heavy taxes and regulations imposed by mercantilist trade policies. After American independence in 1783, smuggling developed at the edges of the US at places like Passamaquoddy Bay, St. Mary's in Georgia, Lake Champlain, and Louisiana. During Thomas Jefferson's embargo of 1807-1809, these same places became the primary places where goods were illegally smuggled out of the nation. Like Britain, a gradual liberalization of trade laws as part of the free trade movement meant less smuggling. In 1907, The Roosevelt Reservation, which was a 60-foot strip of land on the US side of the US-Mexico Border, was established to keep the land "free from obstruction as a protection against the smuggling of goods between the US and Mexico." Smuggling revived in the 1920s during Prohibition, and drug smuggling became a major problem after 1970s. In the 1990s, when economic sanctions were imposed

on Serbia, a large percent of the population lived off smuggling petrol and consumer goods from neighboring countries. The state under President Slobodan Milosevic actually promoted smuggling to fund the wars and to reward Serbian organised crime and Serbian Militias.

In modern times, as many OECD Member countries have struggled to contain a rising influx of immigrants, the smuggling of people across national borders has become a lucrative illegal industry with people-trafficking, especially of women and children effectively enslaved.

Money Laundering

There are various types of smuggling which yield high illegal profits.

Goods

Much smuggling occurs when enterprising criminal merchants attempt to supply demand for a good or service that is illegal or heavily taxed. As a result, illegal drug trafficking, and the smuggling of weapons and humans, as well as the historical staples of smuggling, alcohol and tobacco alongside other highly taxed goods such as Precious Metals & Stones, Wildlife, oil and gas or products used for possible illicit purposes like metals and minerals or cash, are widespread. As the smuggler faces significant risk of civil and criminal penalties if caught, the criminal smuggler can impose a significant price premium. Profits derive from avoiding taxes or levies or restrictions on imported goods. For example, a smuggler might purchase a large quantity of cigarettes in a place with low taxes and smuggle them into a place with higher taxes, where they can be sold at a far higher margin. The following are the main focus of smuggled contraband.

Gas & Oil Smuggling

Gas & oil most profitable smuggling continues to be an issue in countries such as Nigeria, Iran and even Mexico. According to Iranian counter-smuggling authorities, 17% of daily fuel production equivalent to some 40mio liters were being smuggled out of the country every day in 2009. This is while most of the smuggling concerns gasoline and diesel fuel, whereas Iran imports both of these to the tune of 30 million liters every day. Smugglers are using underground pipelines to neighboring countries and oil tankers on the Shatt al-Arab waterway. Iran says its naval security forces have confiscated ten oil tankers smuggling 4,600 tons of Iranian fuel out of the Persian Gulf in 2008. As of 2012, smuggling to Pakistan and Afghanistan continues unabated because of price differentials with these countries. Now about one million liters of fuel is trafficked out of Iran every day.

Another example this time in the US when on 11 August 2009, the US Justice Department reported that US refineries were buying vast quantities of stolen oil from Mexican government pipelines. Criminals, especially drug gangs, tap remote pipelines and sometimes build their own pipelines to siphon off hundreds of millions of dollars worth of oil each year. The US Homeland Se-

curity Department is to return US\$2.4mio to Mexico's tax administration, the first batch of money seized during a joint investigation into smuggled oil.¹⁹

Cigarette Smuggling

Cigarette smuggling is a global problem, which continues to increase in spite of Governments' enforcement strategies. Cigarettes are of high value, highly taxed, readily portable and ideal commodities to be traded illegally. Cigarette smuggling appears to have been developed by organised crime groups as a global criminal business and generates huge profits for those involved.

In 2012 the FATF issued a report titled, "Illicit Tobacco Trade". The report details the affects that smuggling of tobacco has on governments, law enforcement, the tobacco industry, the health industry and others. Specifically, the implications that come from tobacco smuggling are: (1) Deprivation of tax revenues to governments. (2) Redirection of limited government resources to address tobacco smuggling. (3) A disproportionate effect and impact on health services. This is exacerbated by decreases in tax revenue and simultaneously fuels debate to increase taxes on tobacco which in turns stimulates the incentive to increase smuggling activities. (4) Legitimate brand holders struggle to compete in and against a black market created by tobacco smuggling.²¹

The chain of events that must occur for the successful smuggling of tobacco do not include money laundering until the very last step, selling the smuggled tobacco. At that point the illegal money must be laundered. Since organised criminal gangs have a heavy hand in tobacco smuggling it can be assumed that these gangs also have efficient ways and means of successfully laundering the profits of such an operation. See [Organised Crime](#).

Wildlife Smuggling & Poaching

Wildlife smuggling involves the illegal gathering, transportation, and distribution of animals and their derivatives, either internationally or domestically.²² It results from the demand for exotic species and the lucrative nature of the trade. The [CITES \(Convention on International Trade in Endangered Species of Wild Fauna and Flora, 1975\)](#) regulates the movement of endangered wildlife across political borders. Products demanded by the trade include exotic pets, food, traditional medicine, clothing, and jewellery made from animals' tusks, fins, skins, shells, horns, and internal organs.²³ In June of 2012, CITES reported that elephant poaching levels are the worst in a decade and ivory smuggling seizures are at their highest levels since 1989. Smuggled wildlife is an increasing global demand: it is estimated that the US, China, and the EU are the places with the highest demand. Interpol estimates that wildlife smuggling transactions generate between US\$10–20bio annually.

Alcohol Smuggling

Alcohol smuggling has some of the same characteristics in regards to its harms on society as a whole, but is not

as easy to physically smuggle as cigarettes. The smuggling of alcohol is usually done to avoid or circumvent taxation or prohibition laws within a particular jurisdiction. For example, certain Muslim countries, like Iran, forbid the drinking of alcohol therefore Iran has large criminal operations that are involved in the smuggling of alcohol across its borders.

The smuggling of alcohol deprives governments of tax revenues. This is especially true in the UK where authorities reported sales of illegal beer increased by 45% in 2009–2010. The smuggled alcohol was worth US\$1.2bio.²⁴ Smuggling operations also starve law enforcement resources that must be redirected to combat alcohol smuggling operations when the resources could be better used more serious crimes. The smuggling of alcohol also affects legitimate alcohol companies whose products are undercut by cheaper products that are smuggled instead of being purchased on legitimate markets that are legally taxed.

An example of Alcohol Smuggling from Canada to the US is the case of [Pasquantino](#).

Precious Metals & Stones Smuggling

Precious Metals & Stones smuggling remains a significant problem particularly in Africa, the proceeds of which have financed bloody civil wars. For more see [Precious Metals and Stones Dealers](#) later in Part 2, Sub-section 2 below.

Human Smuggling

For details see [Human Trafficking](#) above.

Arms Smuggling

For details see [Illicit Arms Trafficking](#) above.

Cash Smuggling

According to FATF's report in 2006 entitled "Trade-Based Money Laundering", the second of "three main methods by which criminal organisations and terrorist financiers move money for the purpose of disguising its origins and integrating it back into the formal economy" is "the physical movement of banknotes using methods such as cash couriers and bulk cash smuggling." In its paper, "Detecting and preventing the illicit cross-border transportation of cash and bearer negotiable instruments", FATF defines cash couriers as "natural persons who physically transport currency and BNI (bearer negotiable instruments) on their person or accompanying luggage from one jurisdiction to another." Bulk cash smuggling is defined as "the act of making a physical cross-border transportation of currency and BNI in large volumes where the currency/BNI is concealed in order to evade the reporting requirement, often using vehicles or containerized cargo or mail."²⁵

It is estimated that the [Mexican Drug Cartels](#) smuggle approximately US\$20–30bio a year, back from the US, using any of the 417 official border crossings between the US and Mexico, and the many unofficial crossing

points across the border. In 2011, US Immigration and Customs Enforcement reported only US\$150mio in seized cash and 428 arrests in bulk cash smuggling cases.

There are 417 official border crossings between the US and Mexico, and note I said "official" border crossings. One of the methods that the bulk cash smugglers will use is a form of smurfing or structuring where an individual carries approximately US\$5,000–10,000 on his person and crosses the border.

A typical bulk cash smuggling scenario, would look like the following: Money from the sale of drugs for example in New York City, would be taken to what is called a local stash house, or to a central counting location. That money arrives in the form of small dollar bills, usually fives, tens, 20s etc. These need to be refined and turned into larger dollar bills so as to reduce the mass size and make it easier to conceal and to transport. They are then vacuum packed into airtight plastic bags and surrounded with coffee grounds or pepper or other strong substances to thwart drug-sniffing dogs, and the packs are hidden in a vehicle, usually cars or trucks in some sort of hidden compartment. Vehicles are rotated as are drivers, so the same vehicles, drivers and plates are not identified. Further, they use advanced counter surveillance techniques, so they're surveying law enforcement too. They will also be at the border crossings on both sides, using high tech communications and surveillance, watching the border crossing to look to see what lane looks to be the best lane to go through and if there's anybody getting stopped.

Aside from vehicles, one of the methods that the bulk cash smugglers use is a form of smurfing or structuring where an individual carries approximately US\$5,000 to US\$10,000 personally across the border.

Once the cash arrives in Mexico much has traditionally been banked with Mexican financial institutions, including Money Services Businesses such as Casa De Cambios. Mexican Banks and Casa de Cambios would credit an account or wire the monies to a third account, oftentimes abroad, and then send these narco dollars (via armoured truck) back to their affiliates and/or accounts in the US or selling the dollars back to a US bank.

In order to address this problem the Mexican government has announced that it will limit individual bank account holders to deposits of no more than US\$4,000 a month, which should not affect the average Mexican household because the average Mexican household makes far less than US\$4,000 a month.

In response transshipments are being made avoiding direct approaches to financial institutions. According to FATF's 2008 "Terrorist Financing" typology report, "Counter-terrorist operations have shown that cash couriers have transferred funds to a number of countries

within the Middle East and South Asia. Direct flight routes are used for simple transfers; however, indirect routes using multiple cash couriers and changes in currencies take place within more sophisticated schemes."²⁶ Cash couriers are widely used in countries such as Africa and Middle East which have cash-based societies. (see [Money Services Business](#) in Part 2, including [Chop](#), [Fei ch'en](#), [Hawala](#), [Hundi](#) and others).

The FATF developed Special Recommendation IX in 2004 (now Recommendation 32) stating that countries should have measures in place to detect such transportation including a declaration system or other disclosure obligation. The legal authorities should stop or restrain currency or bearer negotiable instruments that are suspected to be related to terrorist financing or money laundering or that are falsely declared or disclosed. Sanctions should be available and measures adopted that enable the confiscation of such currency or instruments.

The higher denomination banknote allows for large sums of money to be smuggled cross-border in less weight and bulk to be carried over and thus avoiding being searched at the border. The high value banknotes are disproportionately used for money laundering such as the CAD1,000 and €500 notes. The Serious Organised Crime Agency claimed that 90% of all €500 notes sold in the UK are in the hands of organised crime. The €500 note is worth in the region of £430 depending on exchange rates (more than eight times the value of the Bank of England's largest publicly-circulated note, the £50 Note and has become the currency choice for gangs to hide their profits. Is it still in existence? It is also dripping with security measures as befits the world's second-highest denomination note (only the little-used 1,000 Swiss Franc has a higher value): watermarks, hologram strip, reflective glossy stripe, EURion constellation, matted surface, bar-codes, ultraviolet ink, perforations, raised printing, colour-changing ink and a serial number, all making it very difficult to counterfeit but still highly desirable to drug traffickers, money Launderers, and terrorists. The notes used to be nicknamed the 'bin Laden', because you knew they were out there, and you knew what they look like, but no one ever sees them. Of course that was before the US finally caught up with bin Laden in 2011.

The introduction of the €500 note in 2002 was a real benefit for the drug dealers as to transport the equivalent of US\$1mio required two suitcases but after the new notes were introduced, the same amount can fit into a backpack. The focus has switched from drugs going from Colombia to the US to drugs flooding Europe, where cocaine sells for roughly twice the amount as in America, and they can hide the money with much less difficulty. The drugs go in through Spain, often via West Africa, and then the euros come back out to the drug traffickers lords in Colombia, in Cali or Medellin or Bogota. Banking regulations in Colombia mean that any deposit over US\$10,000 is notified to the authorities and anyone trying to deposit large amounts

of €500 notes in a Bank would be sure to raise suspicion so instead they use the scores of casa de cambios many unregulated which have sprung up all across Latin America, particularly in Chile, Colombia, Ecuador, Peru and Venezuela. These will exchange foreign currency for local pesos, or courier the notes over to the US to be deposited in a legitimate bank. They then have the money wired back to the drug gang accounts in their home country. As an indication of their importance Colombia's financial regulator, believes 90% of the €500 notes currently in circulation worldwide (outside the EU) are being smuggled into Colombia.

A typical cash smuggling scenario looks like the following; the Euro's will be sent back via smurfs on planes from Spain, first arriving in Venezuela, Ecuador or Peru. Either they change it into pesos at a casa de cambio in those countries, or put it in a backpack to cross into Colombia along the long stretches of the border that are unmanned.

For other Cash Smuggling schemes and techniques and/or vulnerabilities see Hawala, Chop, Hindi etc in Part 1, Section 2, Sub-section 2, Money Services Businesses below and Part 1, Section 1, for Terrorism Finance above and see Part 2, Section 5, Criminals & Terrorists and Section 7, Criminal Cases.

One of the most important is used by Latin American Drug Trafficking Organisations, the BMPE.

Black Market Peso Exchange (BMPE)

Black Market Peso Exchange is a trade-based money laundering system used by Colombian drug cartels. It was discovered in the early 1990s. The Colombian peso brokers purchase illicit funds from criminals from other countries. They often deposit the money into their US bank accounts and sell cheques and wire transfers drawn on those accounts to legitimate business. The Colombian drug dealers export drugs to North America and Western Europe where they get paid in the foreign currency. The dealers convert this foreign currency into Colombian pesos with the help of a peso broker who exchanges the pesos he controls in Colombia for the funds the cartel holds in the foreign countries. The currency broker places these funds into the country's banking system and moves it around. The broker then advertises to Colombian importers that he has foreign funds available for the purchase of foreign products. Contacts of the broker purchase from manufacturers on behalf of the Colombian importers and the broker pays for the products with the drug money. The broker is paid in pesos by the Colombian importers refilling the broker's supply of peso currency funds.

The Black Market Peso Exchange is the largest known money laundering system in the Western Hemisphere, responsible for moving an estimated US\$5bio worth of

drug proceeds per year, from the US to Colombia. Other trade based methods for money laundering include manipulating trade documents to over or under paying for imports and exports and using criminal proceeds to buy gems and precious metals

Terrorism Finance

"Money is the lifeblood of terrorist operations. We're asking the world to stop payment." and "We will starve the terrorists of funding"

Former US President George W. Bush 2001¹

Harms

The major impact of terrorism is not the loss of life, the cost of responding to their activities or even the often times loss of hard won civil liberties, all of which are painful, but on the psychology of a society traumatised by fear and in part terrorised by the atrocities they read and hear about through the media. Whilst this fear is real, the reality remains that a citizen is much more likely to take his own life, be killed in a traffic accident or even drown in a swimming pool than be the victim of a terrorist attack. This is not to minimise the effect of fear and the natural and legitimate desires of societies to protect themselves and to react against deviant and aggressive behaviour. It is also the case that in part the fear is generated by concerns over terrorist's ability to gain access to and use weapons of mass destruction, creating the potential for harm on an almost unimaginable basis. Whilst the traditional view of terrorism was that terrorists would seek to limit casualties so as to make an impact but not to cause an excessive damaging response, the events of 9/11 changed that view. Though the traditional view may still hold for the majority of the major terrorist organisations, Al-Qaeda has clearly departed from that view and only the complacent would consider Al-Qaeda as either a spent force or unwilling if it had the means to use WMD. This is also why Rogue States engaged in developing WMD also cause greatest concern.

Statistics

Terrorist Groups designated by Leading Countries: Australia, Canada, EU, UK, US, India, Russia, China and Turkey include more than 150 groups, though almost none by all, as each country described and designates groups that represent threats to that country but also reflects differences in opinions and, of course, international politics. Paul Ashley in his book the "Complete Encyclopedia of Terrorist Organisations"² lists around 300 terror groups as being perhaps the most important but accepts there are even more that he does not mention. A few are no longer in existence, some have graduated to formal legal opposition, local or government parties, but many remain violent, outlawed and feared by those they oppose. Still most groups are not proscribed as terrorists outside of their borders. Within these 300, all shades of extremism are captured, including religious, nationalist and political,

covering the entire spectrum, from those exhibiting fundamentalist Christian, Jewish and Islamic tenets, minority and separatist groups and extreme right and left wing idealogues and combinations thereof.

Whilst both the US and UK (and EU) include many so called Islamic groups in their limited lists, differences even here exist between two countries with similar attitudes and responses to terrorism. For example, the US list includes, the Shining Path in Peru and the FARC in Colombia, close to home perhaps in South America, both of which are omitted from the UK and EU lists. The US list also includes Hamas and many Palestinian Groups including the Al Aqsa Martyrs Brigade and Lebanon's Hezbollah, whereas the UK and EU mentions only the military wings of both Hamas and Hezbollah and ignores many Palestinian groups like the Aqsa Martyrs Brigade. The UK list includes many Irish Terrorist groups beyond the Provisional IRA.

Whilst Islamic groups certainly appear prevalent in lists of groups designated beyond their immediate borders their significance (beyond Al-Qaeda) internationally is more in the fear they generate than in the true nature of their impact internationally. According to the US Dept of State who last published statistics on the number of known terror organisations by country, in 2004, rated Afghanistan with 13, Pakistan with 12, Lebanon with 10, India with 9, Ireland with 8, UK with 7, Iraq and Israel with 6, Philippines and Turkey with 6 each. According to MPT Terrorism Knowledge Base countries suffering the most fatalities from terrorist attacks (1968-2006) were; Iraq (11,760), US (3,227), India (1,556), Pakistan (1,555), Israel (1,454), Colombia (1,399), Russia (1,356), Lebanon (1,276), Algeria (983) and Afghanistan, (888).

When we think of countries most at risk of terrorist attacks, we usually think of Iraq, Pakistan or Afghanistan. Whilst these countries remain in the top 5 countries at risk, according to a 2011 report from Maplecroft, Somalia is now more at risk than any other country in the world and with the fledgling state of South Sudan also making the top five at number 5.³ The Top 4 countries are believed to sustain over 75% of world's fatalities from terrorism with terrorist attacks are on the increase globally. The 'extreme risk' category also includes: Yemen (6), Palestinian Occupied Territories (7), DR Congo (8), Central African Republic (9), Colombia (10), Algeria (11), Thailand (12), Philippines (13), Russia (14), Sudan (15), Iran (16), Burundi (17), India (18), Nigeria (19) and Israel (20)

Top 5 At Risk Countries for Terrorist Attacks		
1	Somalia	Extreme - 1,385 rating
2	Pakistan	Extreme - 2,163 rating
3	Iraq	Extreme - 3,456 rating
4	Afghanistan	Extreme - 3,423 rating
5	South Sudan	Extreme - 211 rating

Source: Maplecroft 2011

Looking at the year-on-year data, Maplecroft's research also reveals that the number of terrorist attacks rose by approximately 15% globally, with 11,954 incidents between April 2010 and March 2011, compared to 10,394 from April 2009 to 31 March 2010. However, there was a decrease in fatalities falling to 13,492 from 14,478. Significantly the research also reveals that the number of terrorist incidents in Afghanistan increased by over 50% over the same period, rising from 2,246 attacks in 2009/10 to 3,470 in 2010/11.⁴

According to the Global Terrorism Database (GTD),⁵ an open source event database that includes 82,000 domestic and international terrorist attacks since 1970. The GTD shows that Terrorist attacks reached their 20th century peak in 1992 (with over 5,100 attacks worldwide), but had substantially declined in the years leading up to the 9/11 attacks. In fact, total attacks in 2000 (1,351) were at about the same level as total attacks in 1977 (1,307) and worldwide terrorist attacks through the mid-1970s were relatively infrequent, with fewer than 1,000 incidents each year. From 1976 to 1979 the frequency of events nearly tripled. The number of terrorist attacks continued to increase until the 1992 peak, with smaller peaks in 1984, at almost 3,500 incidents, and 1989, with over 4,300 events. After the first major peak in 1992, the number of terrorist attacks declined until the end of the twentieth century, before rising steeply to a 10-year high of nearly 3,300 in 2007 – four years after the start of the Iraq war. Still, total attacks in 2007 were 36% lower than total attacks for the 1992 peak.

Fatal attacks also declined in the years prior to the 9/11 attacks. In fact, fatal attacks in 2000 (580) were considerably lower than they had been more than two decades earlier, in 1979 (832). In general, the number of fatal attacks clearly followed the pattern of total attacks. Fatal attacks rose above 1,000 per year for the first time in 1980. After hovering close to 1,000 attacks annually for most of the 1980s, they more than doubled between 1985 and 1992. Like total attacks, fatal attacks declined somewhat after 1992, bottoming out in 1998 with 426 attacks and then rising again to a global peak of more

than 2,100 fatal attacks in 2007. The peak in 2007 (2,111) was similar to the peak in 1992 (2,178).

In short, in the four years prior to 9/11 worldwide terrorist attacks and fatal attacks were at their lowest level in 20 years. However, both total and fatal attacks have increased considerably since then so that in 2007 total attacks were back to levels they had been at in the mid-1990s and fatal attacks were approaching the peak year of 1992.

Most frequently attacked Countries by Terrorists

1	Colombia	6767
2	Peru	6038
3	El Salvador	5330
4	India	4318
5	UK / NI	3762
6	Spain	3165
7	Iraq	3161
8	Turkey	2691
9	Sri Lanka	2611
10	Pakistan	2536
11	Philippines	2490
12	Chile	2287
13	Israel	2140
14	Guatemala	2023
15	Nicaragua	1986
16	South Africa	1921
17	Lebanon	1913
18	Algeria	1650
19	Italy	1487
20	US	1362

Sources: Global Terrorism Database since 1970

The US has long been perceived as being the target of an inordinate number if not a majority of terrorist attacks, though this is in fact not the case. Indeed Colombia is at the top with the most attacks and Iraq with the most fatalities. Latin America had the largest number of terrorist attacks of any region of the world throughout the 1980s and the first half of the 1990s. Four Middle Eastern or Persian Gulf countries are in the top 20 (Iraq, Turkey, Israel and Lebanon) and four are in South Asia or Southeast Asia (India, Pakistan, Sri Lanka, Philippines). Western Europe contains three countries in the top 20 (UK / Northern Ireland, Spain and Italy).

South Africa and Algeria are the sole countries from Africa in the top 20 most frequently targeted countries.

Most Fatalities by Country from Terrorist Attacks

1	Iraq	17,754
2	Sri Lanka	14,272
3	India	14,434
4	Colombia	13,009
5	Peru	12,496
6	El Salvador	12,496
7	Nicaragua	11,324
8	Algeria	8,545
9	Philippines	6,304
19	Pakistan	5,540
11	Guatemala	5,135
12	Turkey	4,674
13	Burundi	4,080
14	Afghanistan	3,764
15	US	3,394
16	Rwanda	3,200
17	Lebanon	3,093
18	Russia	3,057
19	Angola	2,861
20	UK / NI	2,842

Source: Global Terrorism Database since 1970

The direct international impact of Islamic terrorism on fatalities for example in the last 5 years has been around 5% of the total in North America and less than half a percent in Europe, with the EU only facing one Islamist terrorist attack in 2008. Separatist terrorism remains the terrorism area which affects the EU most. This includes Basque separatist terrorism in Spain and France, and Corsican terrorism in France. Past contacts between ETA and the FARC illustrate the fact that also separatist terrorist organisations seek co-operation partners outside the EU on the basis of common interests. In the UK, dissident Irish republican groups and other paramilitary groups may continue to engage in crime and violence. Nevertheless many of the most well publicized terrorist events carried out in recent memory have been carried out by so called Islamic Terrorists. Al-Qaeda attacks are often ones that are publicised and followed by the International media and where details about the funding of these attacks are available following detailed investigations. Whilst the following

are not exhaustive they are indicative and highlight the relatively small amount of funds required to carry out these significant attacks. These include; 9/11 in 2001 which was estimated to have cost around US\$400,000 -US\$500,000,⁶ the Bali Bombings in 2002 estimated at US\$20,000-US\$35,000, the Istanbul bombings less than US\$40,000, 1998 Africa US Embassy bombings less than US\$50,000, the first World Trade Centre attempted bombing US\$18,000, Madrid Train Bombings US\$60,000 and London underground and transport bombings US\$15,000. Whilst these amounts are not particularly large, denying access to funds will disrupt terrorist activities, in recruitment, in their day to day operations and in being able to carry out lethal activities. In the first few months after 9/11 the US announced that US\$112.2mio had been frozen worldwide which included significant funds of the Taliban regime already frozen since 1999. This increased by 2003 to US\$136mio and by 2005 US\$147mio, with at least US\$36mio frozen by US, US\$24mio by the Swiss, US\$11.9 by the UK, US\$5.5 by Saudi Arabia, and undisclosed amounts by the UAE, Pakistan and Turkey. The amounts frozen relating to the Taliban have since been returned to the Afghan government. Amounts frozen or interdicted for non-Al-Qaeda groups (including the Taliban) or beyond Hamas or Hezbollah remain minuscule.

Definition / Description

There is no single, universally accepted, definition of terrorism, though most agree that it involves the unlawful use of force and violence against persons or property to intimidate or coerce a government or the civilian population, to achieve political or social change.

Many attempts have been made but no final consensus has yet been reached. The Iranians in 1987 suggested, "Terrorism is an act carried out to achieve an inhuman and corrupt objective, and involving a threat to security of any kind, and violation of rights acknowledged by religion and mankind,"⁷ the US in 1989, "premeditated, politically motivated violence perpetrated against non-combatant targets by sub-national groups or clandestine agents,"⁸ the UN in 1992, simply, "Act of Terrorism equals Peacetime Equivalent of War Crime,"⁹ and in 2002 the EU, "given their nature or context, acts which may seriously damage a country or an international organisation where committed with the aim of seriously intimidating a population."¹⁰

The terms terrorism and terrorist are sometimes used to denote opposition to another and to justify this opposition. Existing regimes will often claim that separatists or insurgents are terrorists and now more than ever, with the label of terrorist being one which

should justly ensure all opposition. The phrase one man's terrorist is another man's freedom fighter is a well worn one but often apt. Take a look at the Assad regime's claims in Syria, that the opposition to dictatorial rule is by terrorists, which was a similar refrain from Colonel Gaddafi in Libya and President Ben Ali in Tunisia shortly before the opposition led successful strategies to throw these illegitimate rulers out. Whilst this difficulty exists in countries and against regimes that are plainly undemocratic, the challenge on defining a terrorist should be easier in countries enjoying representative democracy. In reality the term terrorism and terrorist is used by many but only gains real traction against those who challenge the order of the International Community at large. It also is worth noting that there can be a change in view over time, for example, in the 1850s, John Brown was a US abolitionist who advocated and practiced armed opposition to slavery. Brown led a series of attacks between 1856 and 1859, the most famous in 1859 against the armoury at Harper's Ferry. Local forces soon recaptured the fort and Brown was tried and executed for treason. A biographer of Brown has written that his purpose was "to force the nation into a new political pattern by creating terror." More recently, Nelson Mandela was for a time by some considered a terrorist and now greatly respected as one of the world's greatest statesmen, Osama bin Laden, considered a freedom fighter and liberator when fighting the Soviets in Afghanistan and a terrorist once he turned on the West and Yasser Arafat, a Terrorist as head of the PLO, earlier the Al-Fatah faction, then a Statesman after signing the Oslo Peace Agreement with the Israelis and then later as a de facto terrorist once more, once it was clear Oslo was not being implemented. Terrorist financing refers to financing of terrorist groups and their activities.

State Sponsorship of Terrorism

Whilst in some States, its institutions such as the Army, Police or Security Agencies or their proxy militias or thugs may effectively terrorize opposition elements within the State, however, its perpetrators are rarely identified as terrorists. Such actions are criticized but largely disputed and seen by many as an internal matter for the State and its citizens and not for third parties to decide. When, however, States get involved directly in terror operations beyond their borders or where they provide material support to a terror organization then a State may be described as a State sponsor of Terror. When terror is officially sanctioned by a State, government personnel will organize and arrange and carry out the terrorist operation, although such official sanction will rarely be acknowledged. This was the case of Libya, which authorized and carried out the downing of a Pan Am transatlantic flight in 1998.

over Lockerbie in Scotland. Libya also authorised and arranged for the attempted assassination of the Saudi Crown Prince Abdullah in 2003. For details see the case of Abdulrahman Alamoudi in Part 2, Section 7. State sponsorship of terrorism or "state supported" terrorism, is somewhat different and involves a State providing supplies, training, and other forms of support to non-state terrorist organizations, for example a safe haven, false documentation, financing and weapons or the extension of diplomatic services to the terrorists. Examples of state sponsorship is the Syrian government's support of Hamas in Palestine and Hezbollah in Lebanon. Syrian resources and protection enable the huge training establishments in the Bekaa Valley. Another example was the Taliban in Afghanistan who provided a safe haven to Al-Qaeda. On a smaller, more discreet scale, the East German Stasi provided support and safe-haven to members of the Red Army Faction (RAF or Baader Meinhof Gang) and neo-fascist groups that operated in West Germany. Wanted members of the RAF were found resident in East Germany after the fall of the Berlin Wall in 1989.

The Convention on Offences and Certain Other Acts Committed on Board Aircraft, 1963,¹¹ (commonly known as the "Tokyo Convention") was the first of its kind to recognize certain powers of the aircraft commander to restrain anyone believed to pose a safety risk to other passengers. It was followed in 1970, by the Convention for the Suppression of Unlawful Seizure of Aircraft and in 1971,¹² by the Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation.¹³ Supplementary protocol was added to the 1971 convention detailed in the Protocol for the Suppression of Unlawful Acts of Violence at Airports Serving International Civil Aviation (1988).¹⁴ In 2005, Protocol to the Convention for the Suppression of Unlawful Acts against the Safety of Maritime Navigation¹⁵ was adopted to ensure that appropriate action is taken against persons committing unlawful acts against ships. Also in 2005, Protocol to the Protocol for the Suppression of Unlawful Acts against the Safety of Fixed Platforms located on the Continental Shelf¹⁶ was produced in order to reflect amendments to the 1988 protocol of the same name. In 1997, the International Convention for the Suppression of Terrorist Bombings¹⁷ was designed at the UN's Terrorist Bombings Convention. Further to this, in 1999, the International Convention for the Suppression of the Financing of Terrorism¹⁸ was adopted.

Historical Background / Context

Terrorism is hardly a new phenomenon, and has affected the established order throughout time. An early example in the 1st century AD were the Jewish Zealots in Judea (today's Israel), who rebelled against Roman rule, attacking both Jewish "collaborators," including temple priests, and other wealthy elites. The Zealots hid

short daggers under their cloaks, mingled with crowds at large festivals and murdered their victims, then disappearing into the panicked crowds. Their motive was an uncompromising belief that they could not remain faithful to the dictates of Judaism while living as Roman subjects. Eventually, the Zealot revolt became open and the groups were finally besieged and committed mass suicide at the fortification of Masada. The Assassins were the next group to show recognizable characteristics of terrorism, as we know it today. A breakaway faction of Shia Islam called the Nizari Ismailis adopted the tactic of assassination of enemy leaders because the cult's limited manpower prevented open combat. Their leader, Hassan-I Sabbah, based the cult in the mountains of Northern Iran. Their tactic of sending a lone assassin to successfully kill a key enemy leader at the certain sacrifice of his own life (the killers waited next to their victims to be killed or captured) inspired fearful awe in their enemies. Both the Zealots and the Assassins can be seen as forerunners of modern terrorists, with similar motivation, organisation, targeting, and goals. Secondly, although both were ultimate failures, the fact that they are remembered hundreds of years later, demonstrates the deep psychological impact they caused.

Other examples could include the Gunpowder Plot, in the 17th Century, an attempt to destroy the English Parliament in 1605 and in the 18th Century, the Boston Tea Party which preceded the American Revolution. The French Revolution provided the first uses of the words "Terrorist" and "Terrorism", however conversely the use of the word "terrorism" began in 1795 in reference to the "Reign of Terror," initiated by the government, who became known as the "Terrorists". The French Revolution provided an example to future states in how to oppress their populations. It also inspired a revolutionary reaction which started by opponents who employed terrorist tactics such as assassination and intimidation. The Parisian mobs also played a critical role at key points before, during, and after the Revolution, killing prominent officials and aristocrats in gruesome spectacles. The tactics of the French State were not new and would be followed by the new Russian State in 1918 as the Bolsheviks sought to concentrate power and authority and later by Nazi Germany's Gestapo in the 1930s and 40s. Incidentally, it was the Nazi occupiers of Europe during the Second World War who characterized the work of the French, Czech, Polish, and other resistance movements, supplied and fomented by Britain's Special Operations Executive, as "terrorism."

After the Second World War, a series of anticolonial movements for example the Viet Minh against French rule in Vietnam, used the wartime tactics of resistance to attack the French with classic terror tactics, in order to undermine French rule and morale. Similar tactics

were used against the British in Palestine by Israeli groups freedom fighters / terrorists like the future prime ministers Menachem Begin and Yitzhak Shamir leaders in the The Irgun and Stern Gangs who blew up civilians in hotels, assassinated British troops, and ambushed British patrols, in order to achieve the founding of the State of Israel. Following on, the National Liberation Front of Algeria fought French rule with a ruthless terror campaign. The French fought back ferociously and whilst the Battle of Algiers was a military victory, it was a political defeat, leading to the collapse of the French government and returning to power wartime hero Charles de Gaulle, who eventually launched negotiations that led to Algerian independence in 1962.

Airline Attacks

The age of modern terrorism might be said to have begun in 1967-8, with the Arab-Israeli Six Day War of 1967 and the worldwide student movements of 1968. The devastating Arab defeat and the Israeli occupation of the West Bank and Gaza Strip inspired the Palestine Liberation Organisation, too weak to fight an orthodox struggle, to adopt terrorist tactics. Other pro-Palestine groups imposed their demands on a global audience by hijacking airliners and kidnapping Israeli athletes at the 1972 Olympic Games in Munich. Young militants in Europe, Japan, and the US turned to similar tactics for different reasons. In Northern Ireland, a Protestant backlash against the campaigns of the Roman Catholic civil rights movement revived the Irish Republican Army. West Germany's Red Army Faction, Japan's Red Army, and Italy's Red Brigades made common cause with the PLO. They used their training camps and cooperated with each other conducting operations, such as kidnappings and killings against as they saw it fascist capitalism that had taken over their countries.

In Latin America, Castro's Cuba showed many a communist alternative attractive to some and repugnant to others. The left-right battles that waged led to the rise of the Shining Path, Tupac Amaru in Peru, the Movement of the Revolutionary Left in Chile and the FARC and ELN in Colombia amongst many others. Increasing prosperity and a move to greater democracy has diminished many groups though some remain.

With the ending of Soviet support with the end of the cold war, and increased international co-operation, most of these terrorist groups have been defeated or marginalized. Those that survived, the PLO and the IRA, ETA, and the FARC perhaps sustained by a degree of popular legitimacy that stemmed from their origins as national liberation movements have all sought and entered into dialogue with differing levels of success.

Today the rise of Al-Qaeda and other Islamic groups, presents new challenges but also familiar ones. History predicts that they will either be defeated or exhausted or seek to compromise and enter a dialogue and move away from terror tactics. History also predicts the continued existence of States that in one way or another inflict fear and terrorize their citizens. The age of modern terrorism might be said to have begun in 1968 when the Popular Front for the Liberation of Palestine (PFLP) hijacked an El Al airliner en route from Tel Aviv to Rome. While hijackings of airliners had occurred before and already in 1963 The Tokyo Convention (see above) had already been passed, this was the first time that the nationality of the carrier (Israeli) and its symbolic value was a specific operational aim. Also a first was the deliberate use of the passengers as hostages for demands made publicly against the Israeli government. The combination of these unique events, added to the international scope of the operation, gained significant media attention. The founder of PFLP, Dr. George Habash observed that the level of coverage was tremendously greater than battles with Israeli soldiers in their previous area of operations. "At least the world is talking about us now."

In response The 1970 Convention for the Suppression of Unlawful Seizure of Aircraft was passed followed in 1971 by the Convention for the Suppression of Unlawful Acts against the safety of Civil Aviation. Despite International action the internationalisation of terrorism and the cooperation between extremist organisations in conducting terrorist operations intensified. Cooperative training between Palestinian groups and European radicals started as early as 1970, and joint operations between the PFLP and the Japanese Red Army (JRA) began in 1974. Since then international terrorist cooperation in training, operations, and support has continued to grow, and continues to this day. Motives range from the ideological, such as the 1980s alliance of the Western European Marxist-oriented groups, to financial, as when the IRA exported its expertise in bomb making as far afield as Colombia. Whilst flying remains one of the safest forms of travel, incidents when they occur are more likely to result in fatalities. The first fatal aviation accident occurred in 1908, when Orville Wright crashed his Wright Model A aircraft during testing killing his passenger. It wasn't until 1933 that the first 2 Aeroplanes were destroyed intentionally first by fire and then by a bomb and is thought to be the first proven acts of air terror in the history of commercial aviation. Passenger airliners as well as cargo aircraft have been the subject of plots or attacks ever since.

Many early bombings though were suicides or schemes

for insurance money, but in the latter part of the 20th century, political and religious militant terrorism became the dominant motive for attacking large jets, either by hijacking, to publicize a cause or to make demands or by bombing to cause mass casualties. Whilst the political and religious motives are varied, many of the worst incidents, involve so called Islamic or Middle East Terrorists, from Pakistani based groups targeting India and supporting secession from India of Kashmir and Jammu provinces, Palestinian Groups fighting for their State, State sponsored terror from Libya, Chechens for Independence and Al-Qaeda for an Islamic Caliphate.

Whilst dynamite was first used, plastic explosive is the preferred form of bomb as it is both harder to detect and has greater explosive power. Whilst the most common form of terrorist attack was carried out by smuggling explosives into baggage, detonating the bomb once the Plane is in the air usually by timers, more recently with Al-Qaeda representing the most active threat the modus operandi has changed. Al-Qaeda have attempted numerous new ways of bringing down airplanes, including using suicide bombers to either directly crash the Planes or to explode bombs concealed on board or chemicals carried which when mixed can produce an explosion with devastating affects. Most recently Al-Qaeda have targeted cargo planes with bombs

The deadliest aviation-related disaster, considering fatalities on both the aircraft and the ground, was the attack on America on 9/11/2001, killing almost 3,000 people. The deadliest pure Aircraft disasters were not terrorist events. The first occurred in Tenerife when two Boeing 747 aircraft collided when a KLM Boeing 747 attempted take-off without clearance, and collided with a taxiing Pan Am 747 killing 583 people. The second was the crash of Japan Airlines Flight 123 in 1985 which resulted in the highest number of fatalities for a single aircraft. The Boeing 747 aircraft suffered an explosive decompression from an incorrect repair resulting in the death of 520 on board. The first recorded aircraft hijack took place in 1931, in Peru, when a pilot was approached on the ground by armed revolutionaries. Hijackings increased between 1948 and 1957, to 15 and climbed to 58 between 1958 and 1967. A shocking 38 deaths from hijackings occurred in 1968 followed by 82 in 1969, the largest number in a single year in the history of civil aviation. During the period between 1968 and 1977, there were 414 hijackings and between 1988 and 1997, there were 180 hijackings, the number dropping to 98 between 1998 and 2007. Since 2001 to the present day the numbers have fallen considerably to only 43 incidents.

World's Worst Airline attacks by Terrorists (causing 100 or more fatalities)

Deaths	Details
100	1973 - Aeroflot TU-104 exploded over Siberia after hijackers demands not met
110	1989 - Avianca Flight 203 exploded in Colombia, Pablo Escobar responsible
100	1977 - A hijacked Malaysian Boeing 737 airliner downed
112	2002 - China Northern Flight 6136 crashed in China after passenger suicide insurance attack
106	1993 - Transair Georgian Airlines TU - 154B downed by a missile in Georgia
112	1983 - Gulf Air 771, Boeing 737 downed from Pakistan by Abu Nidal Organisation
115	1987 - Korean Air Flight 858 downed by North Koreans
127	1996 - Ethiopian Boeing 767 crashed following hijacking by Ethiopians
132	1990 - Chinese Boeing 737 hijacked & crashed in China
171	1989 - French UTA Flight 772 DC - 10 destroyed over Niger by Libyans
217	1999 - Egypt Air Boeing 767 crashed off Massachusetts after pilot intentionally downed it
259	1988 - Pan Am Flight 103 downed over Lockerbie, Scotland by Libyans
331	1985 - Air India Flight 182 from Montreal downed by extremist Sikhs
2997	2001 - Attack on America on 9/11 by <u>Al-Qaeda</u>

Source: Author (See Part 2, Section 6 below)

As far as hijackings are concerned perhaps the most well known occurred in 1976 when Air France, with 139 passengers on board, was hijacked by Palestinian hijackers. A daring raid by Israeli special forces who landed at Entebbe Airport, Uganda, led to the rescue of almost all Israeli hostages and the killing all Palestinian hijackers (Popular Front for the Liberation of Palestine). However three passengers and one commando were killed. Whilst there are more than 85 cases related to airline attacks, with more than 50 of them resulting in deaths 34 of these are perhaps the most shocking mass casualty events and of greatest importance, indicating new threats and or targets or methods. For a summary of 34 of these attacks targeted at Airlines see Part 2, Section 6 below. Of these 34 there are 14 cases resulting

in 100 or more fatalities. Whilst the last decade has proven to be one where fatalities have been one of the lowest on record, this is due more to foiled and failed attempts, rather than any reduction in threat levels. Whilst Airline attacks have been a preferred method of attack, bombings and shootings are also common, both in the form of mass casualty events and of assassinations, the largest act of international terrorism occurred on September 11, 2001 in a set of co-ordinated attacks on the US where Islamic terrorists hijacked civilian airliners and used them to attack the World Trade Centre towers in New York City and the Pentagon in Washington, DC and attempted to destroy the US Congress building or the White House. In this way the terrorists had wanted to use Airlines as bombs and to cause both mass casualty and assassination at the same time. For details about this attack and more than 100 other major terror attacks see Part 2, Section 6.

Major Fatalities / Terrorist Attacks

202	2002 - Bali Bombings in Indonesia by <u>Jemaah Islamiyah</u>
233	1987 - Bus attacks in Sri Lanka by <u>Tamil Tigers</u>
300	1990 - Attack in mosques in Sri Lanka by <u>Tamil Tigers</u>
301	1983 - Truck bombings of US Marine & French barracks, Beirut by <u>Hezbollah</u>
301	1999 - Bombings of apartment buildings in Moscow Russia by <u>Chechen Terrorists</u> over 12 days
303	1998 - Truck bombings of US embassies in Nairobi, Kenya & Dar es Salaam, Tanzania by <u>Egyptian Islamic Group & Al-Qaeda</u>
317	1993 - 15 bombings in Bombay, India by <u>D-Company</u>
339	2004 - School Hostage Crisis, Beslan Russia by <u>Chechen Terrorists</u>
477	1978 - Cinema Rex Arson Abadan, Iran by <u>Iranian Revolutionaries</u>
2997	2001 - Attack on America on 9/11 by <u>Al-Qaeda</u>

Money Laundering

Terrorist Groups tend to flourish where they can find either a safe haven or where there is sufficient instability or where strong government control is missing. Safe havens include ungoverned, under-governed, or ill-governed physical areas where terrorists are able to organise, plan, raise funds, communicate, recruit,

train, transit, and operate in relative security because of inadequate governance capacity, political will, or both. Whilst Al-Qaeda and Al-Qaeda affiliates are the most well known there are many others that deserve attention and can be found in most regions of the world. What follows is a short summary of the most important. Individual Profiles of many of the terrorist groups can be found in Part 2, Section 5 below.

Africa

In Africa, Somalia. With its long unguarded coastline, porous borders, continued political instability, and proximity to the Arabian Peninsula, provides opportunities for terrorists and is considered a major safe haven, particularly for Al-Shabaab. Sudan remains a US designated State Sponsor of Terrorism since 1993, with elements of several terrorist groups including Al-Qaeda (AQ)-inspired terrorist groups remaining in Sudan, links to Palestinian groups and to Iran. South Sudan attained independence on July 9, 2011, becoming the world's newest country following a long struggle by the Sudan People's Liberation Army, and like its neighbours Uganda, the Central African Republic and the Democratic Republic of Congo (DRC) faces threats from The Lord's Resistance Army (LRA). Earlier similar struggles to that of the SPLA were undertaken by the National Union for the Total Independence of Angola (UNITA) and by the Mozambique National Resistance Movement (RENAMO) with both being effectively defeated. In the DRC which is a vast country bordered by nine neighbours, the Government continues to lack complete control over some large swathes of its territory, especially in the East in and around the Rwandan border where various groups operate, including the Rwandan Patriotic Army (Tutsi) and the Army for the Army for the Liberation of Rwanda (Hutu). In North Africa, in the Maghreb and Sahel regions, the primary terrorist threat is from Al-Qaeda in the Islamic Maghreb (AQIM), particularly until very recently operating from safe havens in Northern Mali and moving to other areas in the Maghreb and Sahel, such as Libya, Niger, and Mauritania, and also from Ansar Dine, a militant Tuareg group in Mali. Following the overthrow and killing of Libyan Leader Muammar Gaddafi in October 2011, an interim national government assumed power in Libya, though there remains a great deal of instability with rival armed groups maintaining control of local areas. It was rumoured that Al-Qaeda leader Zawahiri dispatched AQ fighters to eastern Libya and they remain operational, and that former terror group the Libyan Islamic Fighting Group, had reformed into a success organisation and joined the new coalition administrations. Elsewhere in the region the Armed Islamic Group in Algeria; the Moroccan Islamic

Combatant Group and the Tunisian Combatant Group are active. In West Africa, in Africa's most populous state, Nigeria, the extremist Islamic group, Boko Haram continues to create havoc across the north of the country and in the capital, Abuja, whilst the Movement for the Emancipation of the Niger Delta (MEND) does the same in the Niger Delta.

Middle East

Iraq was until the demise of Saddam Hussein a US designated State sponsor of terror. Whilst the successor governments and coalition forces have faced strong resistance from Sunni insurgency groups, they also faced attacks from Al-Qaeda in Iraq. As such Iraq was considered until recently a safe haven for some terrorist actors though improvements by the government and security forces and the inability to win support from the local Sunni community in Iraq has marginalized Al-Qaeda in the land of the two rivers or otherwise known as Al-Qaeda in Iraq (AQI). Also of note are Abdullah Azzam Shaheed Brigades, Ansar al-Islam, Jamaat Ansar al-Sunna and Khata'ib Hezbollah. Elsewhere in the Middle East, for example in the Lebanon, Hezbollah militias control access to parts of the Country as the Lebanese government does not exercise complete control over all regions. The areas outside the control of the government, some parts of Beirut, much of the South, near its borders with Syria and Israel are controlled by Hezbollah. Palestinian refugee camps are also used as safe havens by Palestinian terrorists and armed groups and are used to house weapons and shelter criminals and terrorists. Gaza more so but also including the West Bank are also safe havens for Palestinian terrorists. Also of note are Amal, Jund al-Sham and Asbat al-Ansar. In the Gulf region, where Saudi Arabia dominates, the government is fighting Al-Qaeda in the Arabian Peninsula and has largely been successful, though the southern province of Jazan adjacent to the Yemen is still an area where AQAP operates and has its base. Yemen's lack of a governmental presence in much of the country and its porous borders were exacerbated in 2011 by political instability, allowing Al-Qaeda in the Arabian Peninsula (AQAP) to retain existing safe havens in Yemen and establish new ones. In a tactical change, AQAP captured territory near Aden, in spring 2011.

Designated as a US State Sponsor of Terrorism in 1984, Iran remains an active state sponsor of terrorism increasing its terrorist-related activity, likely in an effort to exploit the uncertain political conditions resulting from the Arab Spring, as well as in response to perceived increasing external pressure on Tehran. Iran also continued to provide financial, material, and logistical support for terrorist and militant groups throughout the Middle East and Central Asia. Iran provides weapons

and training to assist the Asad regime in the current Syrian Civil War as well as providing weapons, training, and funding to Hamas and other Palestinian terrorist groups, including the Palestine Islamic Jihad and the Popular Front for the Liberation of Palestine-General Command. Since the end of the 2006 Israeli-Hezbollah conflict, Iran has assisted in rearming Hezbollah. Iran has provided hundreds of millions of dollars in support of Hezbollah in Lebanon and has trained thousands of Hezbollah fighters at camps in Iran. Whilst it is believed that Iran has detained senior AQ members it refuses to publicly identify them or take any public action against them. It is thought to allow AQ members to operate a corridor through Iranian territory, enabling AQ to carry funds and move facilitators and operatives to South Asia and elsewhere. In Iran itself the Mujahideen-e Khalq and Jundallah are threats and in Saudi Arabia and Yemen, the threat is from Al-Qaeda in the Arabian Peninsula as well as from an off-shoot, Ansar al-Sharia. Designated in 1979 as a State Sponsor of Terrorism, Syria continues its political support to a variety of terrorist groups affecting the stability of the region and beyond, even amid significant internal unrest. Syria provided political and weapons support to Hezbollah in Lebanon and continued to allow Iran to resupply the terrorist organisation with weapons. The external leadership of Hamas, the Palestine Islamic Jihad (PIJ), the Popular Front for the Liberation of Palestine (PLFP), and the Popular Front for the Liberation of Palestine-General Command (PFLP-GC), among others, were based in Damascus and operated within Syria's borders though Hamas began leaving the country in late 2011 over disagreements regarding Syria's use of violence against protestors. Statements supporting terrorist groups like Hamas and Hezbollah consistently permeated government speeches and press statements. The Syrian Baathist regime provides Iraqi exiled individuals safe haven in Syria, including Iraqi Baathists, with some of them calling for violence against the Iraqi government, Iraqi civilian targets, and American and coalition forces within Iraq. Syria also continues its strong partnership with fellow US state sponsor of terrorism, Iran. Since the outbreak of the Syrian Civil War groups have emerged to fight government forces who the Syrians call terrorists, including the Syrian Islamic Front; the Syrian Islamic Liberation Front; the Al-Nusra Front or Jabhat al Nusra and the Islamic State of Iraq and Syria, the latter believed to be close to or an off-shoot of or successor to Al-Qaeda in Iraq.

In Egypt, Islamic Jihad groups, for example, Egyptian Islamic Jihad and Gama'a al-Islamiyya, were aggressively targeted by the Mubarak government, with EIG's leader Ayman Zawahiri merging his group into bin Laden's Al-Qaeda and since his death succeeding him

as the leader of AQ. Gama'a al-Islamiyya (IG), was Egypt's largest militant group, originally formed by the coming together of militant student cells following the renunciation of violence by the Muslim Brotherhood, whose leader Mohammed Marsi became Egypt's President following democratic elections after the ouster of Mubarak, before being ejected again recently.

The Israel/Palestine conflict continues despite much of the leadership of the Palestine Liberation Organisation including Fatah, renouncing violence and signing up to peace treaties. Still parts of the West Bank and Gaza Strip are home to terrorist groups, in particular some groups that have splintered from the PLO such as, the Aqsa Martyrs Brigade, Tamzin Fatah, Palestinian Islamic Jihad, Popular Front for the Liberation of Palestine and also the Democratic Front for the Liberation of Palestine; the Palestine Liberation Front; the Army of Islam and to Hamas which originated as the Palestinian branch of the Muslim Brotherhood, founded in Egypt. The region was also home to legendary and notorious groups including Black September and the Abu Nidal Organisation as well as Jewish groups the Irgun and more recently Kahane Chai. Whilst sometimes considered part of Europe and at other times part of Asia, Turkey straddles the two and can also be considered part of the Middle East with its southern borders neighboring Syria and Lebanon, and its Eastern border neighboring Iraq. Separatist ambitions have long been held by the Kurds who live in Eastern Turkey and Northern Iraq, though both the Turkish government and the Iraqi governments have long since fought to prevent the establishment of "Kurdistan." The Kurdistan Workers Party (PKK) is the main terrorist group continuing the struggle for the establishment of a State for Kurds with others such as the Kurdistan Freedom Falcons and the Revolutionary People's Liberation Party-Front also included.

Asia

In South East Asia, the numerous islands in vicinity of the Sulawesi Sea and the Sulu Archipelago and around Mindanao in the Southern Philippines, Indonesia and in Eastern Malaysia make it a difficult region for authorities to monitor, and a range of licit and illicit activities occur there which pose additional challenges to countering the terrorist threat in the region. Terrorist organisations such as Jemaah Islamiya and the Abu Sayyaf Group constitute the primary terrorist presence although the New People's Army the Moro Islamic Liberation Front, the Free Papua Movement and Jemah Anshorut Tauhid are also present too. In Southern Asia, Afghanistan and Pakistan remain the two principal countries of concern, with the Taliban, the Hezb-e-Islami Gulbuddin, Al-Qaeda (AQ), the

Pakistan Taliban, Lashkar I Jhangvi, the Islamic Jihad Union Sipah-e-Sahaba, Jamiat-e-Islami, Tehreek-e-Nafaz-e-Shariat-e-Mohammadi and other groups who continue to use these territories to plot and launch attacks within the region and beyond. Portions of Pakistan's Federally Administered Tribal Areas (FATA), Khyber Pakhtunkhwa (KPK), and Baluchistan, in particular remain a safe haven for terrorist groups seeking to conduct domestic, regional, and global attacks. Given the inability of Pakistan's security agencies to fully control portions of its own territory, the Haqani Network and the Quetta Shura exploit the country to plan and direct operations. As far as Kashmir and Jammu are concerned this remains a hot spot and groups like Lashkar-e-Tayyiba continue to operate behind and across the Line of Control (the border along Jammu and Kashmir) between Pakistan and India. Other groups include Jaishe-Mohammed, Harkat-ul-Jihad-al-Islami, Harakat-ul-Mujahideen, Al-Umar Mujahideen, Dukhtaran-e-Millat, Hizb ul Mujahideen and the Balochistan Liberation Army. Whilst historically and until recently the terrorism from Pakistan, and the Civil War in Sri Lanka have been the greatest terrorist threats to India, according to Prime Minister Singh it is Maoist/Naxalite violence in other parts of the country which he calls "India's greatest internal security threat," coming from groups such as the Communist Party of India-Maoist. These groups are allied with The Communist Party of Nepal-Maoist and the Akhil Bharat Nepali Ekta Samaj that operates over the border in Nepal each with the goal of establishing communism and replacing the existing regimes. Sikh Terrorism is also a problem in India with Indian Sikh groups determined to carve out an independent Sikh state called Khalistan (Land of the Pure) from Indian territory. Many of these groups operate under umbrella organisations, the most significant of which is the Second Panthic Committee. Other active Sikh groups include Babbar Khalsa Int, Azad Khalistan Babbar Khalsa Force, Khalistan Liberation Front and Khalistan Zindabad/Commando Force. In Sri Lanka, the once mighty Tamil Tigers operated out of the North of the Island, particularly in the Jaffna Peninsula until their recent defeat by Government forces and in part financed by the World Tamil Movement of Canada and similar organisations elsewhere. Also active were the Tamil Nadu Liberation Army and the Tamil Rehabilitation Organisation both operating in Tamil Nadu in India. In Bangladesh, Islamist fundamentalist groups such as Jamaat-ul-Mujahideen and Harakat ul-Jihad-i-Islami are also active. India's so-called "Seven Sisters" region of small north eastern states has many active secessionist groups. The Kanglei Yawol Kanna Lup, the People's Liberation Front and the Revolutionary People's Front, the United National Liberation Front and the People's

Revolutionary Party of Kangleipak are all "mete" groups fighting for an independent state of Manipur. A number of groups are also active in Garoland including the Achik National Volunteer Council (ANVC), the Garo National Liberation Army, and the Hynniewtrep National Liberation Council (HNLC). Other groups active in Assam, Bodoland and Tripura respectively include the United Liberation Front of Assam, the National Democratic Front of Bodoland and the National Liberation Front of Tripura.

In China, terrorism is focussed on incidents of violence committed in Xinjiang province by separatist groups. Xinjiang, literally "new frontier," is a provincial-level autonomous region situated in the northwest of China. Attacks have increased by members of the largely Muslim Uyghur ethnic group, who identify more closely with the cultures of Central Asia and still resist attempts at assimilation with Han Chinese culture. Organisations identified by the Chinese government as having involvement in violent attacks include the East Turkistan Islamic Movement (ETIM), East Turkistan Liberation Organisation (ETLO), the World Uyghur Youth Congress and the Eastern Turkistan Information Centre. Members of these groups are believed to have received training in Afghanistan and Pakistan. This North West Region of China borders the Central Asian Republics, (CAR States), where the threat from Islamic groups particularly in Tajikistan and Uzbekistan is increasing. Tajikistan is unable to control the 900 mile Tajik-Afghan border, which is where many of the groups are trained and are based. The Islamic Movement of Uzbekistan (IMU) remains a threat, though is still mainly fighting in Afghanistan along with the Taliban. It is feared that many of the fighters in Afghanistan are closely linked to the IMU and will eventually turn their attention from Kabul to Tajikistan. The main terrorist threats in the region come therefore from the Islamic Movement of Uzbekistan, and its offshoots or affiliates Hizb ut-Tahrir al-Islami, Hizb-an-Nusra; Akromiya; Jama'at al-Jihad al-Islami also known as the Jamaat of Central Asian Mujahideen (JCAM), and Islamic Jihad Group (IJG), all of whom are seen as Islamic terrorist organisations affiliated with Al-Qaeda that operates in the Central Asian Region. Other groups relevant also include, the Kurdistan Workers Party, Lashkar-e-Toiba, Aum Shinrikyo and the East Turkestan Liberation Organisation, as each are banned in one or more of the CAR states.

Americas

In Central America, terrorist activity has subsided following the resolution of civil wars in past decades where, particularly El Salvador and Nicaragua, were hardest hit with groups such as the People's Liberation

Forces and Farabundo Marti National Liberation Front in El Salvador then active and the Nicaraguan Democratic Force also known as the "Contras" also then active in Nicaragua. Elsewhere in South America, similar groups operated during past trouble, for examples, in Argentina with the People's Revolutionary Army and the Anti-Communist Alliance, in Uruguay with the Tupamoros, in Bolivia with the National Liberation Army, in Chile with the Movement of the Revolutionary Left (MIR) and the Manuel Rodriguez Patriotic Front (FPMR). In Colombia which borders with Venezuela, Ecuador, Peru, Panama, and Brazil, rough terrain and dense forest cover which coupled with low population densities and historically weak government presence, have often allowed for potential safe havens for insurgent and terrorist groups, particularly the Revolutionary Armed Forces of Colombia (FARC) and the National Liberation Army (ELN) and before them the April 19th Movement and in response the United Self-Defence Forces of Colombia (AUC) and the Popular Revolutionary Anti-Terrorist Army of Colombia (ERPAC) including successor organisations such as the Black Eagles. The Tri-Border Area (Argentina, Brazil, and Paraguay), is also an area of concern. Whilst no credible information has showed that Hezbollah, Hamas or other Islamist extremist groups used the Tri-Border Area for terrorist training or other operational activity, there are concerns that these groups used the region to raise funds from local supporters. The Argentine, Brazilian, and Paraguayan governments have long been concerned with arms and drugs smuggling, document fraud, money laundering, trafficking in persons, and the manufacture and movement of contraband goods through the Tri-Border Area. Peru's primary counterterrorism concern remains Sendero Luminoso (or Shining Path). Although Peru eliminated the Tupac Amaru Revolutionary Movement, and almost eliminated SL in the 1990s, SL remains in tact and involved in and funded through narcotics trafficking is still a threat. Venezuela remains a concern not so much for the existence of the Bolivarian Liberation Forces largely inactive now but because of its close ties to US states sponsors of terror, Iran and Syria as well as North Korea and Cuba. Cuba in the Caribbean has been designated by the US as a State Sponsor of Terror since 1982. Current and former members of Basque Fatherland and Liberty (ETA) continue to reside in Cuba and the Cuban government is thought to provide medical care and political assistance to FARC in Colombia. The Cuban government also continues to permit fugitives wanted in the US to reside in Cuba and also provides some support for these individuals.

Europe

The major terror threat on the European continent comes from Al-Qaeda and mainly AQ inspired acts of terrorism, though the authorities appear to have the upper hand in this confrontation the spectre of the Abu Hafs al-Masri Brigade looms. In Eastern Europe, Russia and its regions, particularly the North Caucasus continue to be concerned with Chechen Terrorists, for example, the Caucasus Emirate and other Islamic separatist terrorist groups. During the Kosovo war the Kosovo Liberation Army was considered by some a terrorist outfit but by others a liberation movement. Beyond AQ and AQ inspired, individual atrocities are possible for example, the attacks in which Anders Behring Breivik, a Norwegian right wing fanatic, bombed government buildings in Oslo, killing eight, and then shot dead 69 people at a Labour Party youth camp on a nearby island. With Europe in the grip of austerity and countries like Greece in economic difficulties, terrorist reactionary groups have emerged for example so called anarchists in Greece continue to launch attacks against symbols of the state, for example, Revolutionary Struggle which followed the Revolutionary Organisation 17 November and Conspiracy of Fire Nuclei. In past decades in Europe, terrorist groups that were active included in Corsica, France, the Corsican Patriotic Front and Action Directe in France itself. In Germany the Baader-Meinhof Group also known as the Red Army Faction, the Communist Combatant Cells in Belgium and the Red Brigades in Italy. Elsewhere in Europe the peace process is holding up in Northern Ireland with only sporadic non-compliance by a small number of Provisional IRA diehards, like the splinter groups the Continuity IRA and the Real IRA other groups involved in the troubles were the Saoir Eire, the Irish National Liberation Army, the Cumann na mBan and Fionn Eireann and in response, on the other side, the Ulster Defence Association/Ulster Volunteer Force. ETA in Spain seems closer to embarking on a similar journey to that of the Provisional IRA, though this will appear to take longer to achieve.

Terrorism Finance

Terrorism Finance is like money laundering in someways but the underlying motives of those undertaking this activity is distinctly different even if the actual process is similar to those used by other criminals. Unlike criminal groups who primarily seek monetary gain, terrorist groups have non financial goals, such as publicity, dissemination of an ideology, the destruction of a society or regime, or simply spreading terror and intimidation. Terrorist groups may also compete with governments regarding their legitimacy and therefore are often unconcerned that their existence

and operations are visible to the public. Indeed this is one of the primary objectives behind their operations. In other respects terrorism financing aspects may mirror traditional Money laundering activity in that terrorist groups will co-mingle legitimately sourced funds with those sourced from criminal acts. The term “terrorism finance” is commonly used to describe a number of distinct types of activity and is best viewed along the lifecycle of money's involvement with terrorists. First, it can consist of the “raising” of initial funds for the ultimate benefit of the terrorist group itself or for a particular operation or type of terrorist activity. Secondly, once raised, the money's will need to be “moved” and then “stored” in a secure place and under the control of trusted persons connected to or acting on behalf of the terrorist group. Finally the funds will then be “used” to further the terrorist groups aims, which may include longer term investment, expenditure on day to day operations or in carrying out planned terrorist attacks.

The above chart seeks to illustrate by utilising this

Lifecycle view of terrorism finance how many of the more successful and well known terrorist groups have sought to “raise” funds largely through either, State sponsors, illicit activity (drug, weapons & tobacco trafficking, through precious metals and stones dealing, and through fraud, including credit card and similar and by kidnap and ransom, extortion and even by Bank Robbery as well as through charitable fund raising, funds moved through the use of wire transfers, money services businesses, informal value transfer services, charities & bulk cash smuggling, “store” monies by using precious metals and stones and bulk cash and “use” monies, via wire transfers, money services business, informal value transfer services & using bulk cash.

The chart provides a composite picture and does not reflect each terrorist groups terror financing activities per se. The way each is undertaken will be influenced by the culture and society within which the particular terrorist group operates and the skills and knowledge of those involved, against the activities of those seeking to interdict and disrupt those activities. For example, [Hamas](#) and [Hezbollah](#), both receive State and semi State support, usually in bulk cash and well as relying on charitable monies, [Al-Qaeda](#) has received funds disguised as charitable donations and has become involved in drug and weapons trafficking, precious metals and stones dealing, kidnapping and ransom. [Tamil Tigers](#) have relied upon charities but also extortion to obtain needed cash to support their activities. The [Irish Republican Army](#) were engaged in weapons dealing, extortion and bank robbery. The [FARC-ELN](#) trafficked in weapons and drugs as well as committed kidnapping and ransom in regions where there is a very formal banking sector, for example in North America and Europe, terror groups operating there have used banks to conduct wire transfers, in Central and South America, where money service businesses are tapped to assist in transferring funds between entities. In the Middle East and the greater Indian sub continent informal transfer systems such as hawala are regularly used to move money cross borders. Where precious metals and stones can still be traded and exchanged for example in Africa and some part of the Middle East and the Indian sub continent, terror groups operating there have used such valuables to conceal their money movement and the proceeds of their illicit activities. Perhaps the most common means to finance terrorist activities is simply cash, the most ubiquitous of products and the most useful in obtaining the goods and services needed to support their terror objectives. For more see Part 2, Section 5, Regions, Countries, Criminals & Terrorists and Part 2, Section 6, Terrorist Attacks.

Theft, Robbery & Trafficking

“A man who has nothing can whistle in a robber's face.”

Juvenal, Roman Poet active in the 1st and 2nd Century AD and author of “Satires”¹

Harms

Theft not only affects those who the crime is committed against but it affects the economy as a whole driving up prices of all goods. For example, a person walks into a grocery store and steals infant formula for her hungry baby. Weeks later the store owner conducts an audit of the inventory and discovers the theft that went unnoticed. In order to recover the losses from the theft, the store owner has no choice but to raise the price of baby formula thereby affecting all consumers.

Robbery, which is simply theft by force or the threat of force, has the same affects on society as theft. For example, a person is driving their car at night and comes to a red light. A criminal approaches the car with a weapon and demands the driver exit the car. The criminal enters the car and drives away robbing the individual of their personal property. However, all is not lost for the victim since auto insurance will most likely reimburse the victim of their stolen property. All consumers of auto insurance are victims since the insurance company will incur the loss. In order for the insurance company to recover the loss they raise the rate of insurance for all consumers.

Raising prices on common goods and services that people rely on because of theft and robbery obviously harms all consumers. Embezzlement is a type of theft that has a negative affect on the general public, especially when the funds being embezzled are public funds. A public official who is in a position of trust with public funds who embezzles robs all citizens from needed maintenance of public service infrastructure and necessary public projects that increase the standard of living of the community.

Statistics

The UNODC compiles statistics at the national level related to serious crimes including theft, robbery and motor vehicle theft. The statistics related to theft, robbery and motor vehicle theft are mostly comprised of developed countries with modern judicial systems and competent law enforcement, which would suggest accurate police reports and therefore accurate criminal statistics. The UNODC does not receive these statistics from many developing countries since in many

developing countries theft goes unreported to law enforcement resulting in statistics that are non-existent, greatly inaccurate or misleading.

The data below shows the US with the most occurrences of theft, more than three times the amount of the second country on the list, Germany. The US is also at the top of the list regarding motor vehicle theft. This may be a result of the amount of vehicles per capita in the US, which is one of the highest in the world, giving thieves a target rich environment to commit their crime. When looking at robbery statistics Mexico sits at the top of the list, which maybe a derivative of the escalating drug war in Central America.

Theft: (excludes burglary; housebreaking; robbery; and theft of a motor vehicle)

Of all the thefts reported to police, identity theft is one of the most prominent types of theft in the world. According to a report by the UN Office on Drugs and Crime (UNODC) The Globalization of Crime: A Transnational Organised Crime Threat Assessment, more than 1.5 million people a year suffer the theft of their identity for an economic loss estimated at US\$1bio.⁴

In the US, identity theft has been the number one consumer complaint at the Federal Trade Commission (FTC), resulting in 19% of consumer complaints. Regarding the type of identity thefts that are reported to the FTC, government or benefit fraud is the number one type of identity theft. Credit card fraud is second on the list where identity thieves steal credit card numbers or open credit card accounts with stolen identities. For more details see Fraud above.

However shocking these statistics can be, the statistics related to retail theft can be just as shocking.

A report conducted by the UK-based Centre for Retail Research titled 2011 Global Retail Theft Barometer attempts to measure the cost of shrink (or leakage), which is a reduction in inventory due to shoplifting, employee theft, paperwork errors and supplier fraud. The study also attempts to measure how shrink affects the consumer. The 2011 report puts the global cost of shrink at US\$199.89 per family. When the cost per family is broken down by country, the statistics become much more staggering. For instance, shrink added US\$423 to the average American family's shopping bill in 2010 and US retailers lost almost US\$40bio in stolen goods, or 1.5% of the US retail sales in 2010.⁵

Definition / Description

Legal systems based on common law traditionally distinguish between theft (taking without consent) and fraud (obtaining with consent through deception), a distinction still preserved in many jurisdictions around the world. The two crimes are rarely regarded as mutually exclusive, and it is generally accepted that a crime may involve both theft and fraud (i.e., the theft and subsequent sale of an automobile).

There is no accepted, universal definition of theft or robbery. The UNODC defines each, however these definitions are used for statistical purposes. The generic definition of theft is when a person intentionally and fraudulently takes personal property of another without permission or consent and with the intent to convert it to the taker's use (including potential sale). Since tangible items can be stolen, intangible items can also be stolen, for example a person's identity.

Robbery is the same as theft but is an aggravated form of theft that involves violence or the threat of violence against a victim in his/her presence. Many criminologists have long regarded statistics on robbery to be one of the most accurate gauges of the overall crime rate. Robbery takes many forms, from simple crimes such as muggings to major ones, for example, art theft, jewel thefts and bank and other so called secure facility robberies.

Other terms must be acknowledged and defined to understand the full, criminal portrait of theft and robbery. As the theft and robbery of goods becomes more sophisticated, additional roles are incorporated in the crime. For instance, a person who knowingly initiates, organises, plans, finances, directs, manages, or supervises the theft of property for sale to others, or who knowingly traffics in stolen property, is guilty of trafficking of stolen goods. The term given to a person who traffics or buys stolen goods is commonly known as a fence. A fence is an individual who knowingly buys stolen property for later resale, sometimes in a legitimate market. The fence thus acts as a middleman between thieves and the eventual buyers of stolen goods who may not be aware that the goods are stolen. E-fencing is the sale of stolen or shoplifted items on the Internet (for example, a person who receives stolen goods from a thief and sells those stolen goods on eBay). Thieves commonly use fences to avoid the hassle and suspicion of selling directly to the final buyers of stolen goods.

Theft is also usually distinguished from embezzlement, in which the offender carries away goods the possession of which had been legally entrusted to him or her. As with fraud, theft is a separate crime from embezzlement,

but the two offenses are not mutually exclusive. Embezzlement may be one of the most detectable forms of theft since the individuals in a position to embezzle funds commonly do so via electronic fund transfers leaving paper trails for auditors to discover and law enforcement to follow.

History Background / Context

Theft and robbery are unfortunately as old as human history itself, are condemned in the ten commandments.

Punishment for theft and robbery was severe, with capital punishment or amputation, assault or imprisonment regularly meted out throughout the ages across many different cultures, and some of the first crimes to be noted in modern English law, in the twelfth century, to be one of a crime, made punishable by the state rather than through compensation of the injured party or through private vengeance. Robbery today, more often than not, carries more serious punishment since robbery involves violence or the threat of violence when stealing property.

In recent times thefts and robberies that have caught the most attention have been this carried out against Banks and secure establishments in order to steal Cash or other valuables such as jewellery and art. Some perpetrators have become notorious, others never caught but ball capture the public's imagination. Of course these include Butch Cassidy who in the US made headlines for robbing trains and ranches as well as Banks, for example, in 1889 at the San Miguel Valley Bank he made off with US\$20,000 in stolen cash.

In 1911, the world's most famous painting, the Mona Lisa, painted by Leonardo Da Vinci, was stolen from the Louvre in Paris by an employee and only recovered 2 years later. Vincenzo Peruggia had hidden in a broom closet, later taking the painting out of the frame and leaving after the museum was closed. Paruggia was an Italian patriot who believed the Mona Lisa should be returned to Italy, who was finally caught trying to sell the painting to the Uffizi Museum in Florence. Peruggia was still hailed as a hero in Italy, serving only 6 months in prison. The painting first toured Italy before being returned to the Louvre where it remains behind a protective and secure bulletproof glass.

In the 1930s arguably the most infamous bank robbers in history, Bonnie and Clyde, (Bonnie Parker and Clyde Barrow) carried out, according to the FBI a "violent crime spree across the Midwest that included auto theft, bank robbery, theft from the federal government, and the murder of more than a dozen people, including many law enforcement officers." following a national

manhunt both were gunned down and killed in 1934. The same year, another infamous bank robber John Dillinger was killed by Police after he and his gang robbed two dozen banks and four police stations. Since the gangsters and the gangs of the 1920s in the US caught the imagination, the limelight since has been shone on the biggest thefts and robberies since, carried out by organised gangs or terrorists, or professional thieves.

The following are considered the largest robberies by amount stolen.

Top Ten Robberies by amount stolen				
	Entity	Co	Date	Amt Stolen US\$mio
1	Central Bank of Iraq	Iraq	2003	US\$1bio
2	City Bonds Robbery	UK	1990	US\$400
3	Boston Museum	US	1990	US\$300
4	Baghdad Bank	Iraq	2007	US\$282
5	Schiphol Airport Heist	NL	2005	US\$118
6	Harry Winston / Jewellery Store	Fr	2008	US\$108
7	Antwerp Diamond Centre	Belg	2003	US\$100
8	Knightsbridge Security Deposit	UK	1987	US\$98
9	British Bank of Middle East	Leb	1976	US\$20-50
10	United California Bank	US	1972	US\$30 est

Source: <http://listverse.com/2009/12/01/10-largest-robberies-in-history/#comments>⁶

Whilst these are all large and significant the following are brief summaries of the top 10.

In what is now considered the largest bank robbery or theft in recorded history, Saddam Hussein's regime conducted a massive raid on **Iraq's central bank**. The day before Coalition forces began bombing Iraq, he sent his son Qusay to make a withdrawal on his behalf with a handwritten note. Qusay oversaw the withdrawal of boxes filled with US\$100 bills in a five-hour operation which is estimated at more than US\$1bio. Approximately US\$650mio was later found by US troops hidden in the walls of one of Saddam's palaces, though the remaining US\$350mio has never been recovered and is considered lost.

Second place involved John Goddard, a 58 year old messenger working for London financial intermediary, who was mugged whilst carrying a briefcase delivering £292mio in bearer bonds; Bank of England Treasury bills or equivalent to cash. Police believe that the **City Bonds Robbery** mugging was carried out by a low level thief brandishing only a knife on an insignificant back street, though that thief was found dead of a gunshot wound to the head before he could be charged and all but 2 of the bonds were recovered soon afterwards.

In third place, and also considered the biggest art robbery in history, was the robbery carried out at the Gardner **Boston Museum** in 1990, when two men dressed as police officers convinced 2 inexperienced security guards at the Gardner Museum that they were responding to a disturbance called in and in the process handcuffed the guards and then after selecting 12 pieces of art with a combined value of over \$300 million, they departed, never to be heard from again. Among the paintings stolen were 3 Rembrandts and a Vermeer.

In fourth place is another robbery in Iraq, this time post Saddam, at the **Baghdad Bank**, where it is believed that 3 guards at the bank made off with a US\$282mio. The culprits were never caught nor the money recovered.

In equal fifth place, at both just over US\$100mio, is first the largest diamond robbery in history, known as the **Schipol Airport Heist** where the thieves stole Dutch airline, KLM cargo truck and KLM uniforms and in February, 2005 took off with a KLM truck that was carrying a large haul of uncut diamonds intended for delivery to Antwerp. The thieves got away with an estimated haul of approximately US\$118 million. As many of the stones were uncut, this made them much harder to trace. In equal place, comes the robbery at **"Harry Winston" Jewellers** in Paris, where in December 2008, four armed men stole approximately US\$108mio of jewellery.

In seventh place is the robbery at the time dubbed the "heist of the century". The robbery took place in 2003 in the **Antwerp Diamond Centre**, by a 5-man Italian team known as "the school of Turin". Safe deposit boxes were forced open and gold, diamonds and other jewellery was looted, valued at more than US\$100mio. The gang was caught using DNA evidence from a found half eaten sandwich.

In eighth place, is the theft of safe deposit boxes in 2003 known as the **Knightsbridge Security Depot**, looting US\$98mio by Italian bank robber Valerio Vicci, who was later caught and sentenced to 22 years imprisonment, later shot and killed.

In ninth place, this time involving a terrorist group, is the **Palestine Liberation Organisation**, who in 1976 stole US\$20-\$50mio worth of jewels, gold, stocks and bonds from the **British Bank of the Middle East** in Beirut, a HSBC affiliate. This is not the first or last time that a terrorist organisation resorts to Robbery, for example see Part 2, Section 7, robbery of the **Northern Bank** by the **IRA**.

In tenth place, in 1972 the safe deposit vault at the **United Bank of California** was broken into by professional burglars led by Amil Dinisio, looting an estimated US\$12-30mio, being caught when a similar robbery with fingerprints left was linked.

Other famous robberies also include Stanley Rifkin's 1978, US\$10.8mio theft, described by TIME Magazine as "the ultimate heist", following the robbery at the **Security Pacific National Bank**, which at the time, stood as the biggest US bank robbery in history. This was topped by Allen Pace, in 1997 who stole US\$18.9mio and criminal mastermind behind the infamous, **Dunbar Armored Robbery**, the largest then cash robbery in US history. Pace was eventually captured and was sentenced to 17 years in prison.

Possibly the most famous robbery in UK history became known as the Great Train Robbery, here in 1963, 15 robbers attacked a mail train making off with £2.6mio (the equivalent of £46mio today).⁷

One of the most notorious specialized operations is known as the **Pink Panthers** international jewel thief network which is responsible for some of the most audacious thefts in criminal history, including the robbery of the jewellery store Harry Winston in Paris, in December 2008, where they escaped with more than €80mio worth of jewellery. They are responsible for what have been termed some of the most glamorous heists ever, with their crimes being thought of as "artistry" even by criminologists. They have targeted several countries and continents, and include Japan's most successful robbery ever amongst their thefts. Interpol believes that the group are responsible for more than 341 cases since 1999 worth in excess of €330mio.

Money Laundering

High value theft or robbery, for example, the theft of high valued art, precious metals or stones or large scale bank robberies, usually involve organised criminal gangs, terrorist organisations or sophisticated criminals who have access to or methods of disposing of their theft and exchanging it for less traceable assets.

Of the largest robberies and thefts, those that were well

planned and highly organised have been successful and much of the loot remains unrecovered. It is extremely unlikely that robbers and thieves would try to bank their ill-gotten gains, with immediate red flags being raised and the consequences for them as a result. For more simple, thefts, cash or property is more likely used and or exchanged via online auction sites though most often on the black market, using intermediaries and or contacts or known "fences."

Aside the grand robberies and major thefts and the petty thefts, are a number of systematic thefts that generate significant criminal proceeds and attract organised and criminal gangs as well as the more opportunistic criminal. These are Identity Theft and Motor Vehicle Theft.

Bank Robbery

Whilst, bank robbery methods are as novel and varied, the most common approach is to step up to a bank teller and make a demand verbally, with a written note, or both, at least in the US, according to the FBI. In the USA for 2008, this technique was used in 3,833 of the 6,700 bank robberies that year. Weapons were threatened in roughly a third of robberies and used in about one in four. Interestingly, again according to US data, robberies most often occur on Fridays and between 9 and 11 a.m. The FBI have a clean up rate of approx 50%

Identity Theft

There are many types of Identity theft including those targeted towards obtaining bank account or credit and debit card details (See Fraud above for details). Nevertheless the most pervasive type of identity theft fraud relates to benefit and entitlement fraud. This fraud occurs when identity thieves use a stolen social security number or similar ID and apply for government benefits or entitlements.

Motor Vehicle Theft

Criminal gangs are known to find cars, particularly attractive and have developed intricate operations, with multiple layers and multiple individuals who participate in the crime. The first layer of the criminal operation is the actual theft of the motor vehicle. The stolen vehicle is then sold to a fence who has the VIN (vehicle identification number) altered and creates a fraudulent Certificate of Title for the stolen vehicle so that it matches the altered VIN. This is done to avoid detection by law enforcement. The fence then sells the stolen vehicle, either domestically or overseas, to a buyer. The funds of these transactions must be laundered in order for the fence to be successful. This may be done by using shell companies or co-mingling the funds from the

criminal racket with a legitimate, cash intensive business the fence may own or have access to. Those stealing the cars and the fence and the buyer may in many cases be closely or more loosely connected or affiliated to a particular criminal gang. Major markets for car thefts include the UK, Netherlands and Germany with then transit routes east including through the Baltic States and the Balkans elsewhere to Eastern Europe and from the US through Mexico and into Latin America.

Beyond theft and smuggling to new markets, commercial Vehicle theft operators may also engage in Stripping Operations, to respond to the demand for cheap used component parts to repair damaged vehicles, where the supply of salvage vehicles available is outstripped by demand. For some the desire to shortcut the process by obtaining parts etc that are already the right color increases their profit margin. Thefts based on orders for specific parts by make, model, and color are not unusual.

And then there is Insurance Fraud, with some estimates that 30% or more of all insurance claims involve some type of fraud. Offenders in this category range from individuals that inflate their claim to organised rings that dispose of vehicles or stage auto accidents among themselves or involving innocent drivers. Inflated and fraudulent insurance claims cost the average driver dearly in premiums.

Other reasons that cars are stolen include joyriders, those about to commit another crime, for example criminals use stolen vehicles for everything from transporting drugs and transportation for robberies and drive-by shootings.

WMD Proliferation Finance

"Proliferation of nuclear weapons to terrorist organisations is far more dangerous than proliferation of nuclear weapons to states, even states like North Korea."³

John Bruton, Irish Prime Minister from 1994-1997¹

Harms

There is little dispute that Weapons of Mass Destruction, or WMD, pose a grave threat to global security and to human life if they fall into irresponsible hands. Whether nuclear, chemical or biological, the consequences could be devastating and so ensuring non-proliferation is essential.

Furthermore it is where Terrorism and WMD Proliferation come together that the real prospect potential for actual harm on an almost unimaginable basis provides greatest concern.

This is why Rogue States engaged in developing WMD cause great concern. Whilst the traditional view of terrorism was that terrorists would seek to limit casualties so as to make an impact but not to cause an excessive damaging response, the events of 9/11 changed that view. Though the traditional view may still hold for the majority of the major terrorist organisations, Al-Qaeda has clearly departed from it and only the complacent would consider them as either a spent force or unwilling if it had the means, to use WMD.

As Rogue States are the most likely conduit to Terrorists getting their hands on such weapons it is essential that a strong WMD proliferation Finance regime is in place and is fully supported.

Statistics

Estimates of casualties from chemical weapons in the First World War vary but were likely almost 90,000 dead and 1.2 million injured.²

To appreciate the devastation of nuclear weapons, the examples of Hiroshima and Nagasaki are the only ones available. Over 185,000 people were killed more than half instantly and the rest over time through the effects of the blasts and the effects of radiation.³

The Halabja poison gas attack was a massacre against Iraqi Kurds by the regime of Saddam Hussein, during the closing days of the Iran Iraq war. The attack is estimated to have killed between 3,200-5,000 and injured around 7,000-10,000 more.⁴

According to the IAEA Illicit Trafficking Database, between 1993 and 2007 there was 1,340 confirmed incidents of nuclear and radioactive material trafficking in the world.⁵ Also IAEA have reported 2,200 recorded attempts of smugglers attempting to steal uranium between 1995 and 2012. In order to create a dirty bomb, at least 55 pounds of highly enriched uranium is needed.

Definition / Description

Proliferation Financing refers to the act of providing funds or financial services which are used, in whole or in part, for the manufacture, acquisition, possession, development, export, trans-shipment, brokering, transport, transfer, stockpiling or use of nuclear, chemical or biological weapons and their means of delivery and related materials (including both technologies and dual use goods used for non-legitimate purposes), in contravention of national laws or, where applicable, international obligations (provisional FATF definition). Without safeguards such funds and services can become accessible to individuals and entities seeking to profit from the acquisition and resale, or even reach terrorists. Proliferators mask their acquisitions as legitimate trade and exploit global commerce for example by operating in countries with high volumes of international trade or utilising free-trade zones, where their illicit procurements and shipments are more likely to escape scrutiny. Proliferation networks work to conceal the end-user of traded goods, the goods themselves as well as the entities involved and associated financial transactions. To ensure that the real end-use of sensitive goods being exported is not detected by authorities, the networks may use intermediaries and front companies to arrange the trade or export of goods and those may use fraudulent documents, such as false end-use certificates, forged export and re-export certificates. Facilitators such as couriers may be used to ensure that the transfer of goods avoids inspection to ensure the safe entry of the goods.

The FATF established Typologies Report on Proliferation Financing providing further details and listing elements that may indicate proliferation financing. The FATF also established a status report on the policy development and consultation of Combating Proliferation Financing.⁶

Weapons of Mass Destruction are essentially those weapons that are designed to release chemical toxins, biological agents or nuclear radiation that can kill indiscriminately or can endanger significant numbers of lives, or cause a major impact on property and/or infrastructure. WMD proliferation is the illegal transfer and export of nuclear, chemical or biological materials

and/or weaponry and/or their means of delivery.

There are currently 8 or perhaps 9 States that possess nuclear weapons or have nuclear weapons capabilities. These are the 5 permanent members of the UN Security Council, US, Russia, UK, France and China, as well as more recent acquirers, India and Pakistan, the Rogue State of North Korea and almost certainly Israel, though it has refused to confirm or deny this. It is also widely suspected that Iran is close but has not yet acquired nuclear weapons, that South Africa had but no longer maintains the capabilities and that Iraq and Libya unsuccessfully attempted to acquire nuclear weapons.⁷ Iraq certainly tried to build a nuclear weapons programme though by the time of the lead up to the second Gulf War it had given up its attempt, though western intelligence agencies famously got this wrong. Libya seeing the writing on the wall after 9/11 brokered a deal to close its programme in exchange for normalising relations with the West.

Nuclear States	
1	US
2	Russian Federation
3	China
4	France
5	UK
6	India
7	Pakistan
8	Israel (Israel still refuses to confirm);
9	North Korea

Source: Inst for Science and Int Security

The Nuclear Non-Proliferation Treaty 1970 (NPT), is based on a central bargain that the NPT Non nuclear weapon States agree never to acquire nuclear weapons and the NPT nuclear Weapons States agree in exchange, to share the benefits of peaceful nuclear technology and to pursue disarmament aimed at the ultimate elimination of their arsenals.

Countries Sought / Seeking Nuclear Weapons	
1	South Africa (dismantled)
2	Libya (Sought & dismantled)
3	Iran (Seeking)
4	Syria (unclear)

Source: Inst for Science & Int Security

Whilst in the area of nuclear weapons, the Nuclear Non-Proliferation Treaty 1970 applies, other treaties apply to biological and chemical weapons. The Biological Weapons Convention 1972 was the result of prolonged efforts by the international community to extend the prohibition already on use of biological weapons, contained in the 1925 Geneva Conventions, to cover also possession and development. The Chemical Weapons Convention 1993 essentially mirrors the BWC, but also provides for the destruction and verification thereof of all Chemical stockpiles.⁸

As of November 2011, around 71% of the declared stockpiles⁹ of Chemical Weapons had been destroyed. Several countries, that are not members are suspected of having Chemical Weapons, especially North Korea and Syria, whilst others including Sudan are accused by some of not declaring accurately their stockpiles. Russia & the US, the 2 countries with the largest declared stockpiles, are in the process of destroying them, with the former at around 57% and the latter at 90% completed.¹⁰

Historical Background / Context

Simple forms of biological warfare have been used throughout history, for example during the 6th Century BC, the Assyrians poisoned enemy wells with a fungus. Hannibal, the great General and scourge of Rome in 184 BC, filled pots with snakes to throw onto the decks of enemy ships during close battle. In the Middle Ages, during the time of the plague, Mongol and Turkish armies were reported to have catapulted disease ridden corpses into besieged cities, later copied in 1710 by the Russians against the Swedes in Tallinn.¹¹

The British tried to use smallpox as a weapon when they gave contaminated blankets to the Native Americans during hostilities in 1763.

At the end of the 19th Century, with the development of science and the increasing understanding and expertise of chemists, concerns about the potential use of Chemical Weapons were raised resulting in the signing of the Hague Convention in 1899 where signatories agreed not to use projectiles whose sole purpose was the diffusion of toxic gas.

With the onset of the First World War in 1914 the Convention would get its first major test. With the battle deadlocked in France, Germany contemplated using Poison Gas to break the stalemate. Not wanting to be the first to break the Convention however they first blamed the French, who they claimed were using a new type of weapon, essentially gas grenades which once exploded giving off lethal fumes. In response and using

this pretext as justification the Germans launched a chlorine ("Mustard Gas") attack at Ypres in 1915, causing general outrage and shocking the world. The Allies would soon respond in kind but throughout the war were generally lagging behind the Germans in the development of new and more dangerous chemical weapons. Estimates of casualties from chemical weapons vary but likely resulted in 90,000 deaths and 1.2 million injured.¹² The largest attacks by far were inflicted by the Germans on the Russians who accounted for around half in each category, though in context this was still a relatively small amount, approximately 4% of the total dead or injured. The Germans also tried to use anthrax to little effect during the First World War.

In World War 2, Japan used biological weapons on Chinese soldiers and civilians, deploying plagued foodstuffs which may have infected over 500,000 people. In response to Nazi Germany which was suspected of developing biological weapons, the Allies produced but never deployed biological weapons, including anthrax toxins, which were tested and left one Scottish Island contaminated for the next 50 years.

In order to finish the Second World War, to avoid the loss of further Allied lives preparing to invade Japan and to persuade the Japanese Military to surrender, the US dropped atomic bombs on Hiroshima Japan on 6 August 1945, instantly killing 60,000-80,000 Japanese citizens, Koreans who had been forced to come to Japan as labourers, and American prisoners-of-war who were imprisoned in Hiroshima. The blast destroyed more than ten square kilometers (six square miles) of the city. The intense heat of the explosion then created many fires, which consumed Hiroshima and lasted for three days, trapping and killing many of the survivors of the initial blast. In all 135,000 would lose their lives with many dying from radiation sicknesses. On 9 August 1945, the Americans dropped a second, more powerful atomic bomb, on Nagasaki, an important Japanese port, which killed 40,000 people instantly and another 10,000 from radiation sicknesses. On 14 August 1945, Japan agreed to the Allies' terms of surrender. At midday on the following day, Emperor Hirohito broadcast the news to the Japanese people. It was the first time his voice had been heard on the radio.¹³

Whilst the US hoped to maintain a monopoly on its new weapon and to keep secret the methods for making nuclear weapons, it took only four years before the Soviet Union detonated its first nuclear device. The UK followed in 1952, France in 1960 and China in 1964. Seeking to prevent the nuclear weapon ranks from expanding further, the US and other like-minded states negotiated the nuclear Non-Proliferation Treaty (NPT).

1970.¹⁴

In the decades since, several states have abandoned nuclear weapons programmes, but others have defied the NPT. India, Israel, and Pakistan have never signed the treaty and possess nuclear arsenals.¹⁵ Iraq initiated a secret nuclear programme under Saddam Hussein before the 1991 Persian Gulf War. North Korea announced its withdrawal from the NPT in January 2003 and has tested nuclear devices since that time. Iran and Libya have pursued secret nuclear activities in violation of the treaty's terms, and Syria is suspected of doing the same. Still, nuclear non-proliferation successes outnumber failures and dire forecasts decades ago that the world would be home to many dozens of states armed with nuclear weapons have not been realised.

The Halabja poison gas attack in 1988 was a massacre against Iraqi Kurds by the regime of Saddam Hussein during the closing days of the Iran-Iraq war. The attack is estimated to have killed between, 3200 and 5000 and injured between 7,000 - 10,000 more. This genocidal act remains the largest chemical weapons attack directed against a civilian population in history. The Iraqi regime dropped bombs by fighter planes on the Kurdish Town of Halabja, with numerous cocktails of chemicals. It is believed that mustard gas as well as sarin and other chemical weapons were used, inflicting terrible deaths and injuries on its victims.

In 1995, during the morning rush hour in Tokyo, sarin gas was released on 3 subway trains, affecting 5,000 passengers, injuring hundreds and killing 8. No one claimed responsibility for the attack, which completely terrorized Tokyo residents, though soon Japanese investigators began carrying out raids on a strange religious group called Aum Shinrikyo which had believed the world was coming to an end. Investigations uncovered several tons of chemicals, some of which could be used to create sarin, gas masks and approximately US\$7mio in cash. At one location, officials found fifty drums containing phosphorus trichloride, a required ingredient for making sarin gas. It was estimated that Aum Shinrikyo had enough chemical materials to kill more than 4 million people.¹⁶

After the September 11 terrorist attacks, where the attacks themselves caused massive loss of life, there were increased concerns about Rogue States as well as black market networks and terrorist groups obtaining WMD and related components, particularly from ex-Soviet countries where controls over stockpiles and materials were considered by many to be negligible.

According to Pulitzer prize winning author, Ron

Suskind in his book "The One Percent Doctrine,"¹⁷ published in 2006, he ascribes to Vice President Dick Cheney an operating principle articulated shortly after 9/11. According to Mr. Suskind, "if there was even a 1% chance of terrorists getting a weapon of mass destruction — and there has been a small probability of such an occurrence for some time — the US must now act as if it were a certainty," and argues that this conviction effectively sidelined the traditional policymaking process of analysis and debate, making suspicion, not evidence, the new threshold for action and as the basis for the decision to invade Iraq in 2003. Mr. Suskind's book also revealed that Al-Qaeda operatives had designed a delivery system (which they called a "mubtakkar") for a lethal gas, and that the US government had an Al-Qaeda source who said that plans for a hydrogen cyanide attack on New York City's subway system were well under way in early 2003, before the attack was called off. The book also reports that Al-Qaeda had produced "extremely virulent" anthrax in Afghanistan before 9/11 which "could be easily reproduced to create a quantity that could be readily weaponised."

In September 2007, Israel conducted an airstrike on what US officials have alleged was the construction site of a nuclear research reactor. Subsequent International Atomic Energy Agency (IAEA) investigations into the US claims uncovered traces of undeclared man-made uranium particles at both the site of the destroyed facility and Syria's declared research reactor. Syria is thought to have obtained crucial nuclear information from North Korea.

In its 2008 report World at Risk, the Commission on the Prevention of WMD Proliferation and Terrorism¹⁸ stated there is a high likelihood of some type of WMD terrorist attack by the year 2013.

In 2012, Syria admitted to possessing a stockpile of chemical weapons and has been accused of deploying these weapons in the course of the Syrian Civil War that rages on. Syria is one of five states that have not signed and seven that have not ratified the Chemical Weapons Convention, which prohibits the development, production, stockpiling, transfer, and use of chemical weapons. Syria is thought to have the third largest stockpile of Chemical weapons. In the area of Ghouta an alleged Assad government chemical weapons attack caused the deaths of hundreds to 1,400 people. Western intelligence agencies have long accused the Syrian regime of using chemical weapons on numerous occasions since 2012 with the latest in August 2013, in the area of Ghouta.¹⁹

Money Laundering

FATF issued a well publicized Proliferation Financing Report in 2008 which discussed the link between financial services and the transfer of WMD. As FATF points out in its report, the complexity of procurement networks has increased, and the number of actors involved in transactions has also increased. Transactions involving multiple parties and transfers of ownership may disguise the true nature of a transaction. While proliferation rings operate globally, government controls are by no means uniform, creating weaknesses that can be exploited. Companies have used a variety of means to evade export restrictions and sanctions filters. Front companies can be used to hide the ultimate end user of a product. One method is the use of a front company to receive the goods and reroute them. Intermediaries are also used. Where goods are transported to a front company in a third jurisdiction, an intermediary is used to obtain the required export licenses for further transport to a proliferator, often by forging an end user statement, falsifying shipping documents or through bribery.

The FATF report discussed a trend toward selling more elementary components – many of which could have multiple uses and might not even be controlled by export authorities. Even if detailed information on a goods shipment is available, highly specialized knowledge is needed to determine if a good is used in proliferation. Finally, transaction parties can conceal the nature of the good shipped and its ultimate application/use by creating fraudulent descriptions.

Some of these disguises and manipulations can be found in the activities of Abdul Qadeer Khan, a Pakistani Nuclear Scientist credited with providing Pakistan with its nuclear weapons. In 2004 Khan confessed to heading a clandestine group that supplied Pakistani nuclear technology to sanctioned countries. Khan admitted to having provided Iran, Libya, and North Korea with designs and centrifuge technology to aid in nuclear weapons programmes. Another example is the case of Li Fang Wei (aka Karl Lee), a Chinese citizen, and his company who helped supply Iran with goods needed for its nuclear and WMD development. The Manhattan District Attorney's Office, working closely with OFAC, charged Lee with misuse of Manhattan banks and the proliferation of illicit missile and nuclear technology to the Government of Iran. In doing so, the MDA drew parallels to its earlier pursuit of financial institutions engaged in payment stripping.

Money Laundering Risks Identified

Whilst all financial institution customers, products and services, channels of distribution and geographies present some kind of inherent money laundering risk, there are particular ones that present increased inherent risks. There are also others where risks can be considered as reduced.

FATF and others, including the US, the EU and the Wolfsberg Group have identified particular customer categories or situations, products and services including the channels by which they can be accessed and geographies that may pose additional inherent money laundering risks, as well as some that may present lower risks.

This Sub-section contains specific information from FATF, the US and the EU and then from the Wolfsberg Group before a summary of the responses developed by UBS both to the specific risks identified, UBS Customer/Product Risk Methodology and Response and the most important measures employed in response, for first Customers and then Products and Services.

Then Sub-section 2 focuses on the main customer types that pose increased risks and Sub-section 3 analyses the core products and services via the main business operations conducted by financial institutions. For each of these major lines of business, the most important risks are identified as well as potential channels or distribution risks as appropriate alongside key scenarios identified that pose the greatest risks and should be considered to be addressed.

Sub-section 4 deals with geographies or country risks, looking at methodologies, examples and many of the most important sources, in order to identify relative risk classifications between countries.

Financial Action Task Force/FATF

The customer segment that has a high inherent risk not usually due simply to itself but its own customers and is most highly regulated are of course financial institutions themselves, including **banks, brokerages, insurance companies, credit, mortgage and other finance houses**. FATF identify in particular **correspondent banking** including **wire transfers** and **money or value transfer services** and **cash couriers**, who move cash and other bearer negotiable instruments cross border, as demonstrating particular risks and requiring additional preventative measures, as well as requiring financial

institutions to consider the risks and take appropriate measures with respect to new products and/or new technologies for both pre existing and new products. These financial institutions are charged to maintain the integrity of the financial system.

Beyond financial institutions, FATF have identified other Categories of increased risks, most notably **Politically Exposed Persons**, who are seen as particularly at risk of Corruption and **Charities and Not for Profit Organisations** at risk for Terrorism Finance.

FATF mentioned risks or risk categories to be addressed	
1	Banks and other FIs incl MSBs / Correspondent & Private Banking
2	PEPs
3	Charities and NPOs
4	Lawyers, Accountants and Company Service Providers
5	Real Estate Agents
6	Precious Metals and Stones Dealers
7	Casinos

Source: Author

FATF have also identified another class they call, **Designated Non-Financial Professions and Businesses (DNFPBs)** being professions and businesses that are seen as being attractive to money launderers and these are: **casinos**, (when their customers engage in financial transactions above US\$3,000), **lawyers, accountants and trust and company service providers, dealers in precious metals and stones** (when their customers engage in cash transactions above US\$15,000) and **real estate agents**.

Beyond DNFBPs FATF have also identified other groups or situations where the risk of money laundering or terrorist financing is potentially higher, and enhanced measures have to be taken, in particular by financial institutions where customers (i) **conduct their business relationship in unusual circumstances** (got example, significant unexplained geographic distance between the financial institution and the customer); (ii) are **non-resident customers**; (iii) are **legal persons or arrangements that are personal asset-holding vehicles**; (iv) are **companies that have nominee shareholders or shares in bearer form**; (v) are **businesses that are cash-intensive**; (vi) have an

ownership structure with a company that appears unusual or excessively complex

given the nature of the company's business; and (vii) have **significant country or geographic risk factors**, in particular

- (a) Countries identified by credible sources, such as mutual evaluation or detailed assessment reports or published follow-up reports, as not having adequate AML/CFT systems and/or where counter measures have been called for
- (b) Countries subject to sanctions, embargoes or similar measures issued by, for example, the UN;
- (c) Countries identified by credible sources as having significant levels of corruption or other criminal activity; and
- (d) Countries or geographic areas identified by credible sources as providing funding or support for terrorist activities, or that have designated terrorist groups operating within their country. For more details about Country Risks see Part 1, Section 2, Sub-section 4 below; Section 4, Sanctions and Embargoes as well as Section 5, Criminals and Terrorists by Region and Country; Section 6, Terrorist Attacks and Section 7, Criminal Cases which have significant country connections.

FATF mentioned risks or risk categories that MAY need to be addressed	
1	Customers conducting business in unusual circumstances
2	Non-resident customers
3	Personal investment company customers
4	Nominee companies or bearer share companies
5	Unnecessarily unusual or complex customer ownership
6	Customers with significant country risk exposure
7	Non-face-to-face relationships/transactions
8	Payments received from unknown or third parties

Source: Author

Where once the visit to the bank would have required a visit to a market square, where the customer could find his banker sitting at a bench or counter (In Italian 'banco' and German 'bank'; both meaning bench or counter), today, customers have a plethora of alternatives to access their bank, including visit to traditional bricks and mortar branches, to use of mail and other physical delivery options, ATM machines, telephone banking, video banking, mobile and online banking. For VIP Customers, private bankers for example or business banking, will often visit customers at their homes or businesses. For other customers or those wishing a less intimate experience, new methods

to access products and services and indeed the design themselves of certain products and services may present risks as a result and therefore FATF go beyond specific customer types and have identified the following as posing potential increased risks: (i) **Private Banking**; (ii) **Anonymous transactions** (which may include cash); (iii) **Non-face-to-face business relationships or transactions** and (iii) **Payments received from unknown or unassociated third parties as particular product, service, transaction or delivery channel risks**.

Finally FATF through its typology, trends and ad hoc other work has focussed on some of the above as well as additional areas of perceived money laundering and terrorism financing risks (beyond predicate offences themselves) and published reports which validate and/or indicate new areas of potential increased risks in the following customer related areas: 2010 - "**Money Laundering Using Trust and Company Service Providers (TCSPs)**"; "**Money Laundering Using New Payment Methods**," which compared the "potential risks" described in the 2006 report on New Payment Methods to the "actual risks" based on new case studies and typologies; "**Money Laundering through Money Remittance and Currency Exchange Providers**," which set out identified money laundering and terrorist financing methods and techniques involving money remittance and currency exchange providers; and "**Money Laundering vulnerabilities of Free Trade Zones**," where concerns have been raised about illicit actors taking advantage of more relaxed oversight to launder the proceeds of crime and finance terrorism highlighting the vulnerabilities of free trade zones.

2009: "**Money Laundering and Terrorist Financing in the Securities Sector**", which studied (i) how criminals might be able to use securities firms to launder money and finance terrorism and (ii) how illicit funds can be generated through fraudulent activities; "**Money Laundering through the Football Sector**", where several case examples of areas that could be exploited by those wanting to invest illegal money into football were described with concerns raised about the risks facing the football sector in particular and the sports industry in general to misuse by criminals; and "**Vulnerabilities of Casinos and Gaming Sector**", which included typologies and also considered vulnerabilities. 2008: "**Money Laundering & Terrorist Financing Vulnerabilities of Commercial Websites and Internet Payment Systems**", which focused on mediated customer-to-customer websites as the most vulnerable to abuse because of their popularity, accessibility (to the public), and high volume of cross border trade transactions, including a number of case studies 2007: "**Money Laundering and Terrorist**

Financing Through the Real Estate Sector”, exploring how illicit money may be channelled through the sector to be integrated into the legal economy and identifying some of the potential control points that could combat this; “**Laundering the Proceeds of VAT Carousel Fraud Report**”, which investigated the characteristics of the money laundering cycle from the proceeds of the fraud to investment into the legitimate economy as well as potential methods of prevention; and “**The Misuse of Corporate Vehicles, Including Trust and Company Service Providers**”, which used cases studies to illustrate the misuse of corporate vehicles, showing key elements and patterns. 2006: “**Report on New Payment Methods**” which reviewed a number of payment methods to identify trends and assess the vulnerabilities to money laundering and terrorist financing. 2004: ‘**Combating the Abuse of Alternative Remittance Systems (SR VI) Best Practice, alternative remittance**”, which provided guidance on how to detect alternative remittance systems outside the conventional financial sector, and “**Best Practice, cash couriers, bearer negotiable instruments, SR IX**”, which provided best practices for the areas that have proven most challenging. 2002: FATF issued “**International Best Practices: Combating the Abuse of Non-Profit Organisations (SR VIII)**”, which included guidance that would best aid authorities to protect non-profit organisations that engage in disbursing funds.

According to FATF (Interpretative Note on Recommendation 10 - Customer Due Diligence) there are circumstances where the risk of money laundering or terrorist financing may be lower, for example: (i) **financial institutions and DNFBPs** – where they are subject to requirements to combat money laundering and terrorist financing consistent with the FATF Recommendations, have effectively implemented those requirements, and are effectively supervised or monitored in accordance with the Recommendations to ensure compliance with those requirements; (ii) **Public companies** listed on a stock exchange and subject to disclosure requirements (either by stock exchange rules or through law or enforceable means), which impose requirements to ensure adequate transparency of beneficial ownership; (iii) **Public administrations or enterprises** though there may be product, service, transaction or delivery channel risk factors; (iv) Life insurance policies where the premium is low (for example, an annual premium of less than US\$1,000 or a single premium of less than US\$2,500); (v) **Insurance policies** for pension schemes if there is no early surrender option and the policy cannot be used as collateral (vi) A pension, superannuation or similar scheme that provides retirement benefits to employees, where contributions are made by way of

deduction from wages, and the scheme rules do not permit the assignment of a member's interest under the scheme; (vii) Financial products or services that provide appropriately defined and limited services to certain types of customers, so as to increase access for **financial inclusion** purposes.

FATF - mentioned excessive risks or risk categories	
1	Shell Banks
2	Unregulated MSBs
3	Iran/North Korea
4	Anonymous Transactions
Source: Author	

United States

Outside of FATF, the US, as can be seen in the FFIEC Bank Secrecy Act/Anti-Money Laundering Manual, have identified the following customer types as posing special risks, requiring financial institutions to take these risks into account in their money laundering prevention programmes. These are: (i) **Foreign financial institutions**, including **banks and foreign money services providers** (for example, casas de cambio, currency exchanges, and money transmitters); (ii) **Non-bank financial institutions** (for example, money services businesses; casinos and card clubs; brokers/dealers in securities; and dealers in precious metals, stones, or jewels); (iii) **politically exposed persons (PEP)**; (iv) **Non-resident alien (NRA)** and accounts of foreign individuals; (v) **Foreign corporations and domestic business entities**, particularly offshore corporations (such as domestic shell companies and **Private Investment Companies (PIC)** and **international business corporations (IBC)** located in higher-risk geographic locations; (vi) **Deposit brokers**, particularly **foreign deposit brokers**; (vii) **Cash-intensive businesses** (for example, convenience stores, restaurants, retail stores, liquor stores, cigarette distributors, privately owned ATMs, vending machine operators, and parking garages); (viii) **Non-governmental organisations and charities (foreign and domestic)** and (ix) **Professional service providers** (e.g. attorneys, accountants, doctors, or real estate brokers).

According to the US Bank Secrecy Act/Anti-Money Laundering Manual, a number of products and services offered by banks may pose a higher risk of money laundering or terrorist financing depending on the nature of the specific product or service offered. Such products and services may facilitate a higher degree of anonymity, or involve the handling of high volumes

of currency or currency equivalents. These include: (i) **Electronic funds payment services — electronic cash** (for example, prepaid and payroll cards), **funds transfers (domestic and international)**, **payable upon proper identification (PUPID) transactions**, **third-party payment processors**, **remittance activity**, **automated clearing house (ACH) transactions**, and **automated teller machines (ATM)**; (ii) **Electronic banking**; (iii) **Private banking (domestic and international)**; (iv) **Trust and asset management services**; (v) **Monetary instruments**; (vi) **Foreign correspondent accounts** (e.g. bulk shipments of currency, pouch activity, payable through accounts (PTA), and US\$ drafts); (vii) **Trade finance**; (viii) **Services provided to third party payment processors or senders**; (ix) **Foreign exchange**; (x) **Special use or concentration accounts**; (xi) **Lending activities**, particularly loans secured by cash collateral and marketable securities; and (xii) **Non-deposit account services** (for example, **non-deposit investment products and insurance**). FINCEN in the US also issue regular “Advisories” to domestic US financial institutions on money laundering and terrorist financing risks, on for example: 2012: **Third Party Payment Processors; Foreign Located Money Services Businesses**; 2010: **Informal Value Transfer Systems**; 2009: **Casino Patrons and Personnel**; 2008: **Casinos and Card Clubs; Foreign PEP's**; 2003: **Informal Value Transfer Systems**; 1999: **Black Market Peso Exchange**.

US mentioned risks or risk categories (Federal Exam Manual)	
1	Foreign FIs incl foreign banks and MSBs
2	Non-bank FIs incl MSBs
3	Casinos and card clubs
4	Brokers/Dealers in securities
5	Precious metals, stones or jewels
6	PEPs
7	Non-resident aliens
8	Foreign Corps/Domestic Shell companies - PICs / IBCs in higher risk locations
9	Deposit Brokers, particularly foreign deposit brokers
10	Cash Intensive Businesses
11	Charities and NGOs
12	Professional Service Providers (attorneys, accountants, doctors or real estate brokers)
Source: Author	

European Union

The EU in its Third Money Laundering Directive 2005 also include a broad category of dealers who trade in goods (but not services), where payments in cash are made in excess of €15,000, which are now known as **High Value Goods Dealers**, which was intended to cover some of the above FATF requirements on DNFBPs and others for example, art dealers and auctioneers, plane, boat, automobile, wine, watch and other high end **dealers**. Switzerland in its Anti Money Laundering Ordinance 2009 also includes “**Professional Banknote Dealers**”, non-banking institutions (companies or individuals) either within or outside Switzerland, which are engaged in buying or selling Banknotes and earn significant income or revenues from such activities.

Other Countries

Some other countries are also of interest, where there may not be a specific mention in legislation/regulation about heightened risks of an industry. In Switzerland, for example, whilst a number of industries are highlighted as being of higher money laundering risk, there is no specific mention of Charities, Auction Houses, Art Dealers, Cash Intensive Businesses or, for example, Sovereign Wealth Funds. **Canada** takes a similar approach to **Switzerland** with the exception of Canada not recognising complex structures specifically as an area of heightened risk but recognising Cash Intensive Businesses as being of heightened risk. Also, Canada mentions the issuance of bearer shares and companies using trade finance services as presenting increased money laundering risk. **Hong Kong**,

Singapore and **Australia** share a similar view on risks, with some notable exceptions: Australia does not specifically recognise Money Services Businesses or Intermediaries as being of increased risk; and Singapore does not specifically recognise Complex Structures as potentially increasing risks. The **UK** goes further than the EU in some respects by considering auction houses, art dealers, arms dealers as presenting increased risks unlike the EU.

The Wolfsberg Group

The Wolfsberg Group in its “Guidance on a Risk Based Approach for Managing Money Laundering Risks,” identified a number of customer groups that may pose higher risks. These are: “**Armament manufacturers, dealers and intermediaries; Cash (and cash equivalent) intensive businesses including: money services businesses (remittance houses, exchange houses, casas de cambio, bureaux de change, money transfer agents and bank note traders); casinos, betting and other gambling related activities, or businesses that while not normally cash intensive,**

generate substantial amounts of cash for certain transactions; Unregulated charities and other unregulated “not for profit” organisations (especially those operating on a “cross-border” basis); Dealers in high value or precious goods (for example, jewel, gem and precious metals dealers, art and antique dealers and auction houses, estate agents and real estate brokers); Accounts for “gatekeepers” such as accountants, lawyers, or other professionals for their clients where the identity of the underlying client is not disclosed to the financial institution. Accounts for clients introduced by such gatekeepers may also be higher risk where the financial institution places unreasonable reliance for KYC and AML matters on the gatekeeper and the use or involvement of intermediaries within the relationship. Also included were customers that are **politically exposed persons or “PEPs”** were also included and financial services, particularly; **International Correspondent Banking** services, and **International Private Banking** services and services involving **Banknote and Precious Metal trading and delivery**.

According to the Wolfsberg Group, certain variables may increase or decrease the perceived risk posed by a particular customer or transaction and may include: (i) **the level of assets** to be deposited by the particular customer or **size of transactions undertaken**. For example, unusually high levels of assets or unusually large transactions compared to what might reasonably be expected of customers with a similar profile may mean that customers not otherwise seen as higher risk should be treated as such. Conversely, low levels of assets or low value transactions involving customers that would otherwise appear to be higher risk mean that a financial institution may decide to treat such customers as lower risk within an overall risk based approach; (ii) **the level of regulation or other oversight** or governance regime to which a customer is subjected. A customer that is a financial institution, for example, regulated in a jurisdiction recognised as having adequate Anti-Money Laundering (AML) standards (or is part of a group that implements a group standard where the parent is subject to adequate AML regulation and supervision and the parent of the customer exercises appropriate oversight over the customer) poses less risk from a money laundering perspective than a customer that is unregulated or subject only to minimal AML regulation; (iii) companies and their wholly owned subsidiaries that are **publicly owned and traded** on a recognised exchange pose minimal money laundering risks. Even though it may become substantially more difficult to distinguish between legitimate and illegitimate transactions, these companies are usually from jurisdictions with an adequate, recognised

regulatory scheme, and therefore, generally pose less risk due to the type of business they conduct and the wider governance regime to which they are subject. In addition, the necessity to have a specific understanding of each of the transactions conducted by these companies is mitigated by the nature of the company (publicly owned and traded from jurisdictions with adequate controls). Moreover, these entities may not need to be subjected to as stringent account opening due diligence or transaction monitoring during the course of the relationship; (iv) **regularity or duration of the relationship**: long standing relationships involving frequent client contact throughout the relationship may present less risk from a money laundering perspective; (v) **the familiarity with a jurisdiction**, including knowledge of local laws, regulations and rules, as well as the structure and extent of regulatory oversight, as the result of an institution’s own operations within the jurisdiction. Greater familiarity will enhance the ability of the institution to assess the client. Note: use by clients of intermediate corporate vehicles or other structures that have no clear commercial or other rationale or that unnecessarily increase the complexity or otherwise result in a lack of transparency for the financial institution. Such vehicles or structures will increase the risk unless the rationale is understood and the structure is sufficiently transparent to the institution.

Additional Sources

From elsewhere (including see Part 2), customers potentially of additional concern and/or worthy of note or possibly on watchlists to consider in the future to money laundering professionals may include, **Embassies, Sovereign Wealth Funds or other State Bodies or State Owned Enterprises**, particularly where country risks are significantly elevated; **Private Military Firms**; companies dealing successfully in Countries where again risks are significantly elevated and the particular industry is more exposed to in particular corruption risks (see Part 1, Section 1, Bribery and Corruption); **Founders of major public companies** where the company is still run and effectively controlled by a founder or founders family where there are concerns over governance and/or transparency; individual **insiders**, senior business leaders trading in their own or related stock ahead of announcements or during restricted periods or without adequate market disclosure; **hedge funds and/or hedge fund managers** including successfully profiting ahead of public announcements, or Funds producing too regular or too predictable positive results, suggesting possible fraud; **Import and export companies** involved in trading items regularly smuggled, for example alcohol or tobacco; and **carbon credit traders**.

Arms Dealers

"You know who's going to inherit the world? Arms dealers. Because everyone else is too busy killing each other."
The character Yuri Orlov in the movie "Lord of War"

Introduction

The defence industry has undergone significant change following the end of the arms race and the Cold War. Defence production and weapons procurement are no longer the epicentre of foreign policy or defined as state assets. Military spend has reduced and the industry has globalised, accelerated in part by modernisation and the need for cutting edge technology. This has left a relatively small number of legitimate giant suppliers with transnational supply chains. Stockpiles of old Soviet weapons and arms related unemployment have also had an impact. It is estimated that for 2010 US\$1.735 trillion was spent annually on military expenditures worldwide.² This represents 2.5% of World 2011 GDP – a decrease from the 1990s when the figure was closer to 4%.

Whilst the industry has globalised and modernised over the past 20 years, the industry is prone to corruption. According to Transparency International, the defence industry is the most corruption-prone of all international businesses. In the US, it is estimated that the defence sector accounted for almost 50% of all bribery allegations in 2006. It is not surprising then, that many of today's leading global defence contractors such as Lockheed, BAE and Thales have been embroiled in some sort of corruption scandal. In the US, the widespread practice by defence contractors in the 1970s of bribing foreign government officials to win business, led directly to the enactment of the FCPA.

Corruption can in part be attributed to the heavy reliance placed by defence contractors on intermediaries who are handsomely rewarded and often engaged only because of their connections. Cases such as BAE, Bofors, Thomson CSF and Lockheed all involved complex webs of commission payments, offshore bank accounts and intermediaries. Middlemen such as Adnan Khashoggi attained notoriety for his role in arms deals and openly flaunted his wealth and close relationships with key decision makers.

Although a legitimate industry may have globalised, regulation and controls have not, leading to a highly profitable black market. Since the end of the Cold War, there has been a proliferation of opportunistic individuals involved in the arms business, particularly those in trafficking to Africa, creating a black market

estimated at US\$1bio a year.³ For more details see Part 1, Section 1, Illicit Arms Trafficking and Part 2, Section 7, Criminal Cases; Illicit Arms Traffickers; Mohamed al-Kassar, Viktor Bout, Tomislav Damjanovic, Pierre Falcone, Adnan Khashoggi, Simon Mann, Leonid Minin and Basil Zaharoff.

Definition/Description

Arms dealers are individuals or companies involved in the manufacture, provision, sale, purchase, distribution or hire of defence, arms or war related materials (arms, aircraft, ships, tanks, military equipment, weapons systems spares, ammunition explosives etc). Research and development, technology and electronic systems plus ongoing support and service are increasingly important products and services. There are a range of actors who might fall within this definition or be involved in transactions. For example, a large defence company such as global giants Lockheed or BAE Systems; a company or individual who acts as a facilitator, intermediary or other service provider on behalf of a contractor or end customer; an end customer (traditionally a government); or a government official or other PEP, who is in a position of influence (or closely associated with) with respect to defence spending, procurement and awarding contracts. Private military firms are considered in further detail in their own right later in this Sub-section 2.

The top ten countries with the highest defence budgets for 2010 are set out below.

Countries Top 10 Defence Budgets 2010			
Country	Spending US\$bio	World Share (%)	% of GDP 2011
1 US	711	41	4.7
2 China	143	8.2	2

Human Rights Groups and charitable organisations such as Oxfam campaign⁶ widely for the need to regulate the supply of arms and have complained that UN efforts to establish a global arms trade treaty have been unsuccessful due to opposition from countries which are major arms exporters. However, recently the UN passed an Arms Treaty, The Arms Trade Treaty 2013, which provides for common international standards for the import and export and transfer of conventional arms. Arms embargoes imposed by the UN though are regularly contravened with little enforcement action, let alone successful convictions. In Angola for example, the French Government assisted

the procurement of arms on behalf of the ruling party in direct contravention of the UN Embargo via Pierre Falcone and others.

Money Laundering/Terrorist Financing Risks

Conflict zones and instable political environments, where arms dealers often operate, have weak infrastructures, little or no accountability or rule of law, one party leadership and opposing rebel groups. Weapons once legally manufactured and traded may be later purchased in cash or countertraded for oil, diamonds or other commodities on the blackmarket. Leonid Minin, for example, supplied Liberian, President Charles Taylor, helping him commit genocide in neighbouring Sierra Leone. Tomislav Damjanovic and, of course, Victor Bout also traded arms with many others including Jonas Savimbi, the leader of the UNITA rebel group in Angola in exchange for diamonds. Arms dealers operating in the black market are also likely to be involved in or facilitate murder, drug trafficking and other organised crimes.

The market characteristics of the defence industry also make it easy for illegal trade to flourish. Traditionally, the industry has been highly concentrated, with a small number of customers (usually governments) who have a monopoly as sole purchaser. Power and decision making is further concentrated in a small number of individuals who are public officials or PEPs and therefore such agreements can pose Grand Corruption risks for example see Bofors; Lockheed Martin; BAE Systems and Thomson CSF-Thales. On the supply side, there are a relatively small number of manufacturers or contractors: contracts are usually long term (sometimes decades) with highly lucrative fees in the billions of dollars; offset arrangements are usually built in to contracts which are opaque and not clearly defined; and, there is a general lack of transparency around arms contracts, sales and commissions, usually on the proclaimed basis of national interest and state secrecy.

Cash flows involved are usually complex, making identification of the true originators and recipients sometimes impossible to establish. Flows of money are often channelled through multiple shell companies, into various offshore accounts and via numerous handling agents and nominee companies and via intermediaries. Examples of intermediaries, particularly of note, include Adnan Khashoggi and Pierre Falcone, but also Andrew Wang (see Thomson CSF-Thales). Legitimate businesses often pay secret commissions to offshore companies or agents without taking appropriate due diligence steps to identify the true purpose behind the payments. The obfuscation is of course often deliberate, such as was the case with BAE Systems and Thomson CSF-Thales.

Banks & other Financial Institutions

"Cause that's where the money is." Willy Sutton

Allegedly in response to the question, "Willie, why do you rob banks?" posed by a journalist, serial US Bank Robber Willie Sutton, also known as "Slick Willie", answered this phrase that is now considered an urban legend.

Introduction

Paradoxically, whilst the odd bank robbery is still carried out the proceeds of crime and the laundering of criminally derived funds are a much greater threat to a bank. Criminals use banks at each stage of the money laundering process, trying to disguise the criminal origin of the funds in the mass of other people's monies that Banks are responsible for looking after.

Definition/Description

FATF as per Recommendation 1 of their 40 AML/CTF Recommendations, expect all countries to require banks and other financial institutions, "to identify, assess and take effective action to mitigate their money laundering and terrorist financing risks," and then through Recommendations 10-21 provide specific measures that apply to financial institutions.⁷ For details see Part 1, Section 3, Laws and Regulations, FATF below. The underlying rationale for these Recommendations is due to the fact that, as Willie Sutton ruefully supposedly replied, banks are where the money is. Additionally, banks operate as intermediaries between savers and borrowers, both individuals and businesses and also operate the global payment system; and as such are the fulcrum of the international financial system. For more details on the workings of the international payment system see Part 1, Section 2, Sub-section 3, Products and Services Risks; A Brief History of Banking and Correspondent Banking.

Banking in the modern sense of the word can be traced to medieval and early Renaissance Italy, to the rich cities in the north like Florence, Venice and Genoa. The Bardi and Peruzzi families dominated banking in 14th century Florence, establishing branches in many other parts of Europe. One of the most famous Italian banks was the Medici Bank, set up by Giovanni di Bicci de' Medici in 1397. The earliest known state deposit bank, Banco di San Giorgio (Bank of St. George), was founded in 1407 at Genoa, Italy. The oldest bank still in existence is Monte dei Paschi di Siena, headquartered in Siena, Italy, which has been operating continuously since 1472.

It is followed by Berenberg Bank of Hamburg (1590) and Sveriges Riksbank of Sweden (1668). The word bank was borrowed from "banque" in French, "banca" in Italian and "bank" in German which means bench or counter. Benches were used as desks or exchange counters during the Renaissance by Florentine bankers, who used to make their transactions atop desks covered by green tablecloths. The term bankrupt is a derivative and was used to denote the destruction of the counter and the end of business for a banker that had lost money and could no longer operate. For more details see Part 1, Section 2, Sub-section 3, Products and Services Risks and in particular "A History of Banking" below. The Worlds largest banks by assets size are:

Source: www.relbanks.com - Setember 2013			

There are more than 10,000 banks that use the SWIFT international payment network, representing 212 countries.

The US has the most banks in the world in terms of institutions 7,085 (at the end of 2008) with Germany in second place with 2,400 (at the end of 2006 according to the Centre for Economic Research) and Russia in third place with 1,200 (at the end of 2006 according to the Centre for Economic Research).

No other country in the world has more than 1,000 banks, for example Japan had 129 banks (at the end of 2008). Assets of the largest 1,000 banks in the world were US\$96.4 trillion in the 2008/2009 financial year with profits of US\$115bio.

EU banks held the largest share of the total, 56% in 2008/2009, Asian banks 14% and US banks 13%. Assets of the largest 500, were US\$62mio and of the largest 25, Fee revenue generated by the top ten global investment banking totaled US\$72.1bio in 2011.

Banks' activities can be divided into retail banking, dealing directly with individuals and small businesses; commercial banking, providing services to mid-market business; corporate banking, directed at large business entities; private banking, providing wealth management services to high net worth individuals and families; correspondent banking, providing banking services to other banks; and investment banking, relating to activities in the financial markets. Banks are also acting as credit card companies or issuers and brokerages providing access to the financial markets, including securities such as equities. For more details see Part 1, Section 2, Sub-section 3, Products & Services Risks below.

Banks offer many different channels to access their banking and other services including by automated teller machines, in retail branches, call centres and telephone banking; by mail: most banks accept cheque deposits via mail and use mail to communicate to their customers, for example, by sending out statements; by mobile banking, by using a mobile phone to conduct banking transactions; by video banking, by performing multiple transactions, payments etc. over the internet; by relationship managers, mostly for private banking or business banking, often visiting customers at their homes or businesses; banking used for performing banking transactions or professional banking consultations via a remote video and audio connection.

Money Laundering / Terrorist Financing Risks

Banks and other financial institutions have been and continue to be targeted by criminals, money launderers, terrorists and terrorist financiers in many ways. The services that banks and other financial institutions offer can be abused by these people, exploiting the vulnerabilities of some products and services, and seeking to disguise themselves and their actions alongside millions of other legitimate transactions. In particular, inherent vulnerabilities and or attractiveness to criminals in wealth management/private banking and correspondent banking are probably the most obvious, though other products and services have also been abused too, including banknotes trading, precious metals dealing, trading, securities brokerage, credit cards, retail and commercial. In fact there is probably no area of banking that has or does not suffer from targeted abuse from criminals and their funds.

For a comparison of the inherent risks presented through the offering of banking products and services, see Part 1, Section 2, Sub-section 3, Products and Services Risks and in particular in Risk Assessment in Part 1, Section 4 below.

Sometimes criminals will come from the ranks of the bank's own staff, in the form of rogue trading, employee fraud, or corruption, or be working with or for external criminal gangs, though this is thankfully rare, banks are known to be targeted and their impact can be devastating.

Banks posing the greatest inherent risk are those with significant customer, country, product and services and channels risk exposures. These banks may still not be considered high risk provided they have designed and implemented effective comprehensive Money Laundering Prevention Programmes as they are required to do.

For more details see Part 1, Section 4, Money Laundering Prevention Programmes for details.

Additionally a number of banks, bank types and bank products and services have been highlighted as posing very high risks and these should be identified and appropriate action taken. For example, banks in countries where FATF has recommended counter-measures be applied, banks sanctioned or designated by relevant authorities and so called shell banks.

Cash Intensive Businesses

"Organised Crime in America takes in over US\$40bio a year and spends very little on office supplies"

Woody Allen, Comedian

Introduction

With cash being generated by many profitable crimes, such as drug trafficking, counterfeit and piracy, smuggling, human trafficking and illegal gambling, businesses are used as a cover in order to launder these criminal proceeds. Businesses that are particularly established or taken over are those that are cash based anyway, such that the taking and deposit of large amounts of cash into a business bank account is not unusual. As such cash intensive businesses can provide a cover for depositing additional, illegally earned cash into a bank account, and the payment of suppliers, both domestically and internationally, provides a good excuse for transfers of amounts of all sizes.

For some the term money laundering was coined to describe the actions of US mobsters during 1920s and early 1930s era of Prohibition. Their activities, which included sale of alcohol, illegal gambling and prostitution, generated large amounts of physical cash, much of which was in coins, so they owned and operated both slot machine and laundromat businesses, both of which took coins to operate the machines, and the coins could therefore be deposited without suspicion into front company bank accounts appearing legitimate. For more details see 'What is Money Laundering' in Part 1.

Cash intensive businesses may also be used to facilitate money transfers acting as an intermediary between sender and recipient, in much the same was as a money transfer business, with the potential for underground banking taking place and the potential vulnerability of facilitating terrorist finance either unwittingly or unwittingly.

Definition/Description

According to the BSA Exam Manual, "cash-intensive businesses and entities cover various industry sectors. Most of these businesses are conducting legitimate business; however, some aspects of these businesses may be susceptible to money laundering or terrorist financing. Common examples of cash-intensive businesses: convenience stores; restaurants; retail stores; liquor stores; cigarette distributors; privately owned automated teller machines (ATM); vending machine

operators and parking garages. The US BSA Exam Manual also highlights risks with those involved in bulk shipments of cash. According to UK Guidance, (JMLSG) the focus is on high cash turnover businesses, they include: casinos, bars, clubs, taxi firms, launderettes and takeaway restaurants.

Money Laundering/Terrorist Financing Risks

Whilst cash remains significant as a mode of payment for criminal products and services, the need to launder that cash will require the establishment or takeover of cash-intensive businesses.

Retail Type Outlets

Examples are numerous, but include The Pizza Connection, where Al Dente's Pizzeria in New York, was used by the Italian American Mafia, to launder drug trafficking proceeds, jewellers identified in the La Mina/Operation Polar Cap case and Speed Joyeros, who laundered for Colombian drug traffickers and Carnival French Ice Cream, which operated as an unlicensed money transfer business in New York via an Ice Cream Parlour. It is perfectly legitimate and understandable why many businesses operate mainly in cash, or take cash regularly. In many parts of the world, cash is still the dominant medium of exchange and even in many highly industrialised countries, many people do not have credit or debit cards. Nevertheless, where cards are readily available, the traditional benefits of accepting cash are diminishing, though good reasons remain. For example, with cash, the business receives payment immediately, with no waiting for a cheque to process or a card transaction to show up in the businesses account, avoiding concerns about fraud, bounced cheques or bogus credit/debit cards. Also there are no fees for card payments, which can reduce profit on each business transaction, particularly an issue when the transaction is small.

When establishing and maintaining banking relationships with these cash-intensive businesses, whilst most will be simple and straightforward and operate legitimately, there may be exceptional cases where there is an increased need to understand the customer's business operations; the intended use of the account; including anticipated transaction volume, products and services used; and the geographic locations involved in the relationship. In particular areas of increased risk may include factors or more likely a combination of factors which could include: the KYC information available and updated; the volume, frequency, and nature of cash and cash related transactions; the use of products and services and the Geographic footprint of the business, its customers and suppliers. For example, whilst documentary evidence may have been collected as to the

business owner, is the owner personally known, a long standing customer and/or the owner of a business that has been visited by the bank. A cash-intensive business that purports to be successful may, upon visiting the premises be obviously bogus, if the business is, for example, run-down or empty of customers, particularly at busy times. A business that has a high cash turnover may stand out versus equivalent businesses especially in that area or region so comparing businesses that can be clustered and identifying those that stand out may also be useful. For example, in the case of Carnival French Ice Cream, an ice cream parlor in New York City, filed approximately US\$185,000 which were the receipts from the legitimate business. Nevertheless, during the period 1996-2003 the business also acted as an illegal money transmitter, making payments to the Middle East and in particular Yemen of almost US\$22mio. Payments were also made to Saudi Arabia, UAE, Thailand, Canada and China which were unlikely to appear to have anything to do with the ice cream business.

Another risk area to consider is the use of other products and services. Illicit cash-intensive businesses are probably less likely to apply for credit, utilise non-face-to-face business channels to communicate and transact and are well aware of bank reporting thresholds and so avoid triggering these.

As a result for those customers deemed to be particularly higher risk, banks should consider additional periodic on-site visits, interviews with the businesses' management, and/or closer reviews of transactional activity and product and service usage. Most cash-intensive businesses, the use of cash registers or POS (point-of-sale) machines to record sales is common place, so cash sales should still be recorded and the use of invoices and other paperwork can also substantiate a cash transaction. Where necessary this additional substantiation of a customers business activities could be requested, along with tax filings and the like.

Private Automated Teller Machines (ATMs)

Whilst bank owned ATM machines have become ubiquitous, the growth in private owned ATMs also known as "white label" cash machines in many countries, now outnumber those owned and offered by Banks, being a lucrative industry, placed in hotel lobbies, bars and food courts, they provide quick access to cash, albeit with a hefty charge, either owned by the retailer or by private non-bank businesses such as Independent Sales Organisations (ISO). Although all privately owned ATMs are not high-risk, they are particularly susceptible to money laundering and fraud related activities.

A Report from Canada by the Canadian Police, the RCMP, claims that the Hells Angels biker gang control at least 5% of the private ATM business in Canada, with at least C\$315mio a year possibly being laundered through these white-label ATMs. For example, the Hells Angels are suspected of arranging to have an ATM placed in a club. The owner of the club, a front person chosen for their lack of criminal record, would apply for the necessary security clearance and, after receiving it, could stock the machine with a mix of bar proceeds and criminal drug proceeds. As long as the machine stayed under a safe limit, say C\$5,000 a day, it would be unlikely to draw attention.

Key to risk mitigation is effective KYC, on the owner if a private retail owned ATM or on the ISO, for example, obtaining information from the ISO regarding due diligence on its sub-ISO arrangements, such as the number and location of the ATMs, transaction volume, currency volume, and evidence regarding the source of any replenishment currency, for example evidence as to the sources of currency for the ATMs by obtaining copies of armored car contracts or lending arrangements. In addition scrutiny of transaction activity to identify excessive unusual usage and reviewing expected ATM activity levels, including currency withdrawals.

Bulk Cash Shipments

Bulk shipments of cash are made legitimately by land, sea and air. Those involved may be individuals or businesses that generate currency from cash sales of commodities or other products or services (including monetary instruments or exchanges of currency). Shippers also may be "intermediaries" that ship currency gathered from their customers or other intermediaries, normally banks, central banks, non-deposit financial institutions, or agents of these entities. Still as cash smuggling is one of the major mechanisms used by organised criminal gangs to move illicit funds out of countries, those that receive the smuggled bulk cash must find ways to re-integrate the currency from where it comes. Bulk shipments of currency come from shippers, usually Bank's that are presumed to be reputable but the cash may nevertheless originate from illicit activity. The monetary proceeds of criminal activities, for example, often reappear in the financial system as seemingly legitimate funds that have been placed and finally integrated by flowing through numerous intermediaries and layered transactions that disguise the origin of the funds. Layering can include shipments to or through other jurisdictions.

Casinos Including Internet Gambling

"For every dollar of revenue generated by gambling taxpayers must pay at least three dollars in increased criminal justice costs, social welfare expenses, high regulatory costs and increased expenditures."⁹

John W Kindt, Professor of Bus Admin, University of Illinois

Additional quotes from John Kindt include:
"Although crime and corruption decreases within a one mile radius of a casino, it increases 10% within a 35 mile radius by the third year the casino is open".

"The ABCs of legalised gambling - addictions, bankruptcies and crime".

"Gamblers spend 10% less on food, 25% less on clothing and 35% less on savings".

"Every slot machine takes US\$60,000 out of the local economy".

Introduction

Gambling in one form or another is as old as recorded history, though it has never been as popular as it is today. According to FATF,⁹ statistics from 2007 show that over 150 countries participate in some kind of legal gambling and 100 of these countries have legalised casinos. Over 100 countries offer some kind of lottery product and over 60 countries participate in the racing and sports betting industry.

Whilst the size of the gambling market conducted through legalised casinos was approximately US\$100bio in 2009 according to PWC,¹⁰ casinos despite regulation, are high-volume cash businesses and Casinos are still susceptible to money laundering.

Of even greater concern are illegal gambling operations which exist outside of the formal regulated sector and internet gambling sites. The illegal gambling market is estimated by Havocscope at US\$140bio.¹¹

Whilst the US has been the world's largest casino gaming market, this is set to change in 2013 according to PWC who predict that Asia will take over the number one spot.

Major Casino Markets by Revenues		
1	US	US\$57bio
2	Asia	US\$21bio
3	EMEA	US\$17bio
4	Canada	US\$3bio
5	LATAM	US\$425mio

Source: PWC 2009

Asia is no stranger of course to gambling. The Chinese recorded the first official account of the practice in 2300 BC, but it is generally believed that gambling in some form or another has been seen in almost every society in history. From the ancient Greeks and Romans to Napoleon's France and Elizabethan England, much of history is filled with stories of entertainment based on games of chance. The first known European gambling house, not called a casino although meeting the modern definition, was the Ridotto, established in Venice, Italy in 1638 to provide controlled gambling during the carnival season. It was closed in 1770 as the city government perceived it to impoverish the local gentry. In American history, early gambling establishments were known as saloons. The creation and importance of saloons was greatly influenced by four major cities; New

Orleans, St. Louis, Chicago and San Francisco. It was in the saloons that travellers could find people to talk to, drink with, and often gamble with. During the early 20th century in America, gambling became outlawed and banned by state legislation and social reformers of the time.

However, in 1931, gambling was legalised throughout the state of Nevada, along with Las Vegas and Reno. America's first legalised casinos were set up in those places. In 1978 New Jersey allowed gambling in Atlantic City, now America's second largest gambling city.

As high-volume cash businesses, casinos were the ideal businesses to be owned, controlled or used by money launderers, particularly organised crime and taking advantage of the change in the law in Nevada that legalized gambling, the *Italian American Mafia* via one of its most colorful lieutenants, Benjamin "Bugsy" Siegel. Before Bugsy focused on Las Vegas, Las Vegas was nothing more than a desert town inhabited by cowboys and a few slot machines. After Bugsy and fueled by Mob money, Las Vegas grew and grew. Before Las Vegas, American tourists looking for a good time had to travel all the way to Cuba, so Las Vegas was much closer to home and only a little over a decade after the first casino opened in Las Vegas, Fidel Castro's Cuban Revolution led to the closure of the Cuban Casinos.

Monaco is also a longstanding, well known location for casinos and gambling.⁷

Definition/Description

FATF have identified a class of businesses they call, "Designated Non-Financial Professions and Businesses (DNFPBs)" being professions and businesses that are seen as being attractive to money launderers and these are: casinos, (when their customers engage in financial transactions above US\$/€3,000), lawyers, accountants and trust and company service providers, dealers in precious metals and stones (when their customers engage in cash transactions above US\$/€15,000) and real estate agents. Casinos are the only form of gaming or gambling explicitly covered by the FATF standards however the FATF standards do not define casino or gaming, nor do they set out the activities undertaken by casinos. Casinos were the first non-bank financial institutions required to develop AML compliance programmes.

In addition to gaming, casinos offer a variety of financial services including accounts, credit, funds transfers, cheque cashing, and currency exchange often operating 24 hours a day with high volumes of cash transactions

taking pace very quickly.

The term "casino" is of Italian origin, the root word being "casa" (house) and originally meant a small country villa, summerhouse or pavilion. The word changed to refer to a building built for pleasure, usually on the grounds of a larger Italian villa or palazzo. Such buildings were used to host civic town functions – including dancing, music and gambling. In modern day Italian, this term designates a bordello (also called "casa chiusa", literally "closed house"), while the gambling house is spelled casinò with an accent. During the 19th century, the term "casino" came to include other public buildings where pleasurable activities, including gambling, and sports took place.

Casinos usually involve customers gambling by playing games of chance, in some cases with an element of skill, such as roulette and craps, card games such as blackjack and poker and of course lottery, fruit or slot machines. Casinos may also provide facilities to place bets on sports, traditionally on horses but now more generally across various sports and not just on the result. Most games played have mathematically-determined odds that ensure the Casino has at all times an advantage over the players, known as the house edge. In games such as poker where players play against each other, the house takes a commission called the rake. Casinos sometimes give out complimentary items to gamblers.

Money Laundering/Terrorist Financing Costs

Casinos have long been recognised as vulnerable to money laundering abuse, largely due to the volume of cash involved and through the process of gambling, proceeds of crime can become effectively laundered into legitimately acquired funds, albeit likely at a cost. As casinos also provide services similar to those provided by financial institutions, including accounts, credit, funds transfers, cheque cashing, and currency exchange, they face similar risks to financial institutions.

Today casinos are in many parts of the world highly regulated but in others regulation is developing, patchy and in some effectively non-existent. Even in well regulated jurisdictions, casinos report high incidences of money laundering.

Money laundering schemes involving casinos usually start with the purchase of casino chips using illicit cash. The chips then can be used in the following ways. After de minimis gambling, chips are: i) cashed in for a casino cheque or wire transfer that is deposited

into a bank account, ii) used as a form of currency for goods and services, particularly illegal narcotics, so that others ultimately cash in the chips; and iii) used for gambling to generate certifiable winnings.

Whilst criminals will structure transactions at banks and MSBs to avoid transaction records or reports that draw attention to them, they use casinos for the opposite purpose. Having a CTR filed on a casino payout has the effect of making the money appear legitimate. Criminals also use casinos to launder counterfeit money, as well as large currency notes that would be conspicuous and difficult to use elsewhere. For example, Australia's hotel poker/slot machines are increasingly being used by criminals to launder millions of dollars each week. Criminals deposit A\$10,000 at a time and once a few bets have been made cash out and collect a casino cheque for the portion of the remaining funds. The trick is so well known to criminals that the hotels offering poker machines are referred to as "LLs" - Local Laundries.

Of particular concern outside of well regulated jurisdictions and casinos, are those experiencing significant growth, poorly regulated jurisdictions, particularly those located in geographic areas characterised by poor governance, political instability or bordering regions with significant crime or terrorist problems. Additional concern areas include illegal casinos and gambling houses, high seas casinos, junkets, and VIP rooms and internet gambling.

Whilst it is conceivable that casinos could be used in connection with terrorist financing there are no reported examples, and any such activity would look like possible money laundering and not terrorism finance in any event.

Significant Growth and Emerging Markets

Singapore is significantly expanding as is Papua New Guinea. Macau continues to grow, with a new push since 2004 when the opening of the Sands Macau ushered in a new era of American brands opening in the Chinese enclave. In the US, tribal casinos have moved rapidly from relative obscurity within the US casino industry to a position of prominence in the past 15 years. Tribal casinos now surpass Nevada revenue by more than two-fold.

Significant activity in emerging markets can be seen in Asia and Africa. A number of developing countries with cash based economies and weak AML frameworks are looking at casinos including Palau and East Timor. The poor regulation or existence of casinos in countries with weak AML regimes are attractive venues for criminals,

particularly organised crime groups who seek to control or own casinos or aspects of casino operations. Criminals attempt to infiltrate or influence casinos to facilitate theft, fraud, money laundering, loan sharking and other crimes. Loan sharking is prevalent in casinos in a number of jurisdictions and indeed many junket operators (see Junkets below) extend credit as part of their service package. It is believed that organised crime groups work with the junket operators to extend "credit" at rates beyond any legal maximum to gamblers. Persons in debt to loan sharks are then vulnerable to coercion strategies to assist money laundering schemes in casinos.

Illegal Casinos and Gambling

Illegal casinos and gambling generate more than the total revenue from the formal regulated sector at over US\$140bio a year. Not surprisingly the involvement of organised crime is prevalent. From the early days in Las Vegas the *Italian American Mafia* and in Asia with Chinese organised crime gangs such as the Triads operate to either control or use casinos, both legal and illegal as appropriate to generate and launder criminal proceeds. One of the countries where illegal gambling is particularly prevalent is Thailand. Following a detailed study by the Thai Government it was revealed that there were between 200-300 illegal casinos or gambling houses in Bangkok with up to US\$17bio generated through illegal gambling in the country both in the cities and close to the border, particularly with Myanmar. Whilst Thailand has tried to tackle the problem, including by arresting over 100,000 people a year, illegal gambling shows no sign of being curtailed. The business is fuelled by Thai junket operators offering and providing casino tourism services to mostly Asians, particularly Chinese, providing transportation accommodation and moving money from for example China to Thailand and providing local or foreign currency in which to play. As many of the illegal casinos and gambling houses are located close to borders and/or require movements of people and monies across borders, it is thought that, especially where organised crime is involved that networks and connections with smuggling, human and drug trafficking are made.

High Seas Casinos

High seas gambling (also called boat gambling or floating casinos) involves gaming vessels that travel to international waters to conduct gaming/casino activities. These may be long-distance cruises that have gaming/casinos as side entertainment, or short distance trips that are directed solely at gaming. Gambling on the high seas boasts many attractions. For one, with rare exception it is tax-free and out of government supervision. The prevalence of gambling in international waters is an

issue for all countries with cruise ships registered or operating within their jurisdiction. While many countries prohibit casinos on ships from operating in territorial waters, cruise ship gambling in international waters is not well regulated.

Few jurisdictions have regulatory oversight over cruise ship casinos registered to their jurisdiction and fewer have AML/CFT controls over cruise ship casinos. Since cruise ship casinos, with only minor exceptions, are allowed to operate only when in international waters the casinos are largely unregulated. Whilst some steps have been taken within the cruise line sector to self regulate via the International Council of Cruise Lines (ICCL), it is unknown what general record-keeping or due diligence processes, if any, are carried out by cruise lines or if they report suspicious activities to appropriate authorities.

There are not many studies about the level of risk presented by gambling that is undertaken in international waters. For example, it is not readily apparent what methods are used to transfer funds to and from the cruise ship and any associated money laundering risks.

Regulatory control over "high seas gambling" raises complex questions of international law. If AML/CFT laws were to apply, it is not clear which jurisdictions would have oversight; the jurisdiction from which the ship is operating from, or the jurisdiction where the vessel is registered.

Some jurisdictions impose tax and AML regulations on cruise ship lines, such as the US. Ships registered in the US are subject to income tax and money laundering legislations, meaning that US citizens and permanent residents must declare any income from cruise-ship gambling with customs on returning to the US and through yearly tax returns. The cruise line is also required to file tax notices for jackpots of over US\$1,200. However, there is some question as to whether all US registered ships comply with these requirements, and it is unknown the nature or level of oversight by US authorities.

High seas gambling is an issue for many jurisdictions, for example Hong Kong where a number of cruise ships or large luxury vessels, operate from their harbours, with the sole or primary purpose of providing casino gaming in international waters. These vessels sail under foreign flags, so port jurisdictions have difficulty in imposing AML/CFT controls on these "foreign" vessels due to the limitation of extra-territorial jurisdiction. In very few cases do the AML/CFT rules of the "flag flying"

jurisdiction apply to the high-seas casino. The lack of supervision of casinos operating in international waters leaves port jurisdictions exposed to casino related money laundering risks.

Jurisdictions have raised the challenges faced by the issue of extra-territorial jurisdiction over gambling activities beyond flag-flying vessels, as per the current status of international law. There appears to be a need for further consideration of the issue and possible multilateral solutions.

Government bans on police officers patronising casinos further exacerbates the lawless culture on board a gambling boat. The Chinese Government has banned officials from gambling and tightened policies on tours to Macao, making casinos on the high seas even more popular. Government officials have frequented high sea casinos since the 1990s. One of the most infamous gamblers, Ma Xiangdong, former Vice Mayor of Shenyang City, visited Macao casinos 17 times and the Oriental Princess casino four times. He once allegedly lost tens of millions yuan within three days.

In 2008, mainland Chinese authorities arrested Lian Chao, nicknamed "Gambling King of the High Seas," for alleged money laundering for Huang Guangyu, the founder of home appliances chain Gome.¹³ Huang was taken into custody in late December 2008. Lian, one of the investors behind the Neptune fleet of casinos, often invited Chinese officials and businessmen aboard to gamble. Huang was one of his clients, and Lian is alleged to have helped him launder money through gambling. The Neptune is a five-star luxury ship in Hong Kong, nine stories tall, and with a capacity to accommodate 500 people.

Junkets

The largest money laundering loophole in certain jurisdictions is the fact that the AML regulation applicable to casinos may not cover "junket" operators. A junket is an organised gaming tour for people who travel to the casino primarily to gamble. The term Junket has its origins in Chinese where Jin literally means introducing and Ke means customers. It is a method of casino marketing developed in the late 1930s for introducing customers to the expanding Macau gaming industry. The junket may include transport, accommodation, incentives to play at the casino and the movement of funds to and from the casino. The junket may be run by the casino itself or an independent operator. Junkets appear to be common in casino jurisdictions in the Americas, Caribbean and Asia, but are less common in European Casinos. Operators of junkets account for more than half of Macau's gaming

revenue. As of January 2009, Macau had 153 licensed junket operators.

Junkets are also a convenient way for China's mainlanders to evade China's strict capital control requirements. Chinese law forbids its citizens from taking more than 20,000 renminbi (£1,800) over the border so wealthy mainlanders deposit their money with junket operators. China also has an annual cap of US\$50,000 on conversion of RMB to foreign currency further incentivising junket use.¹⁴ Once in Macau, the junkets dispense the money back to individuals, and extend credit, often two to three times the amount originally deposited with them. They bring the VIPs to the Casinos, and are paid huge commissions. Back on the mainland, gamblers who fail to pay up face menacing debt collectors. The other rather less acknowledged factor is money laundering. The junkets take in Chinese Renminbi (which cannot be converted on the world's money exchanges) while the casinos can pay out in dollars. Suitcases of dollars take the quick trip from Macau to Hong Kong, much of it pouring into the city's property market. Even bigger sums are believed to head into offshore tax havens. Whilst AML laws require application of KYC regulations to casino customers, the junket operators are able to circumvent this requirement by acting as an agent between the gambler and the casino. The junket operators have the ability to move large amounts of money across borders and through multiple casinos on behalf of their clientele and may use wire transfers to move funds on behalf of their clients. The identity of the junket client may be unknown to the sending and receiving financial institution or the receiving casino.

Relatively few casino jurisdictions regulate junkets. Whilst the US has a long history of regulating junkets, Macau has only recently taken steps toward clear regulation. Macau's efforts to strengthen enforcement in this area are evident. The Macau Public Prosecutions Office announced in October 2011 that the number of criminal cases handled by the office had increased 10% between January to August of 2011.¹⁵ The Office highlighted a growth in the number of AML cases connected with the gaming industry, mainly with illegal gambling in VIP rooms.

Whilst this enhanced enforcement is important, the Office should also focus on legal gambling in VIP rooms where authorised junket operators facilitate money laundering by allowing gamblers to shield their identity and hide behind the junket operator. The pressure for law enforcement to turn a blind eye cannot be overlooked. The Casinos are a huge cash cow for the Chinese state, too, which levies tax at 39% and, as

noted above, Hong Kong benefits from inflows from Macau.

VIP Rooms

Every casino in every gaming jurisdiction in the world has to deal with both substantial players ("VIP players") and regular players ("mass market customers"). The approach that Macau has taken is significantly different from the rest of the world. These two categories of players are ushered into two different casino systems and so make Macau's traditional casino industry a dual system, a VIP system and a "mass market" system.

The operational style of the mass market system of Macau's traditional casino industry is similar to what one would find in Nevada casinos. The unique part in Macau has been the VIP system. Macau's VIP-room contractual system began in the 1930s, and slowly evolved due to the special cultural and geographic conditions affecting Macau and southern China, and matured by the mid-1980s. Since the mid-1980s, Macau's casino industry has been dominated by the VIP sector; in terms of gross gaming revenues, VIP rooms captured about 70% of market share in 2004.

The VIP Room "contractual system" means the casino contracts with a VIP Room operator or promoter to operate a VIP Room at the casino.¹⁶ The VIP promoter enters into a contract with the casino company that outlines the rights and responsibilities of both parties. The documents are worded on room-by-room basis. The agreement usually sets out minimum dead chip sales (see below), rewards for over-selling, revenue sharing agreements and deposits promoters must pay.

The VIP promoter plays a pivotal role within the VIP-room system between the casino and junket operators. He is the organiser and maintainer of the interpersonal web of junket operators. He also serves as a lender to junket operators and occasionally to customers. The VIP promoter is also the one who bears major risk in terms of credit transactions within the VIP-room contractual system. VIP promoters can either be natural persons or legal persons. Whereas, a junket operator is typically a self-employed person who earns dead-chip commissions by selling his customers to a VIP promoter.

There are three major elements that construct the VIP room system: Dead Chips, VIP Rooms, and VIP Room Contracts. The dead chip, also called junket chip, non-negotiable chip, or clay chip, is a kind of casino chip which is sold or lent by the casino to VIP promoters or junket operators for betting purposes only. Dead chips are not cashable or refundable by customers, but are only usable in making wagers in the VIP room where

they were purchased or borrowed. Since the dead chip is financially less flexible, logically its price should be cheaper than regular casino chips. The dead chip's normal price is discounted by a certain percentage but face value remain the same. The difference is known as "dead chip commission" and functions as a payment vehicle for the casino to reward the marketing efforts of VIP promoters and junket operators. Customers cannot purchase or borrow dead chips directly from VIP room casino cages. The casino only sells or lends dead chips to VIP promoters and junket operators. VIP promoters and junket operators can only buy or borrow dead chips from the VIP room's cage, and VIP customers can only buy or borrow dead chips from VIP promoters or junket operators. Dead chips designed to guarantee the chips will actually be wagered on the gaming tables in that VIP room rather than going back to be cashed out at the cage without having been put into action. The customer is assured complete confidentiality via this arrangement.

The VIP room itself is an individual room or set of rooms within a larger casino specifically designed and designated for VIP customers' usage only. All properties of the VIP room still belong to the casino; the dealers and the gaming managers are employees of the casino; and the gaming operations of a VIP room are run by the casino. Often there are no documented contracts between VIP promoters and junket operators, whose cooperation and transactions are based on convention and oral agreements or, sometimes, simple bookkeeping. Furthermore, there was as of 2006 no regulatory requirement for the VIP contracts to be reviewed by regulatory authorities. If a VIP promoter is unable to meet his minimum sales in a particular period, then other VIP promoters who have exceeded their targets may shift some of their sales to help them out or, more commonly, the VIP operator "loans" the room to VIP promoters who have no contractual relationship with the casino. There is a general lack of transparency in who ultimately controls the VIP rooms behind the public face on the contract. VIP Rooms are widely known to be the domain of organised crime also offering loan sharking and prostitution services on top of anonymous gambling to the VIPs.

As more casinos operate in Macau, the competition for VIP customers increases causing profit margins to quickly get squeezed. Additionally, the casinos offering contracts to VIP Room operators do not play on a level playing field. Most of the new entrants into the Macau market that have significant casino operations in other jurisdictions - the American gaming companies Las Vegas Sands, Wynn Resorts, and MGM and the Australian company PBL - must adhere to stricter

standards than the Macau-owned casinos with respect to business practices of VIP promoters and junket operators. Therefore there will be ongoing competitive pressures to modify or change the VIP system in ways that are more compatible with their business models and regulatory sensitivities. After winning one of the original concessions, Wynn Resorts refused to break ground on its Macau casino until the legislation was changed that would allow the casino itself to grant credit, rather than being dependent on VIP promoters and junket operators for such services. An important consideration for this demand was the concern of being at the mercy of these independent contractors - many of whom might not be licensable by international regulatory standards - rather than agents employed directly by the casino for this important segment of the market.

Internet Gambling

Before the 1990s, individuals who wanted to place a casino or sports-type bet in the US basically had two choices: they could travel to a legitimate brick-and-mortar gaming establishment or place an illegal wager through a bookmaker. However, with the emergence of the internet in the mid-1990s, a new form of gambling appeared - on-line gaming casinos and sports wagering. Internet gambling involves any activity that takes place via the internet and that includes placing a bet or wager. Courts generally have defined a bet or wager as any activity that involves a prize, consideration, and chance. A prize is anything of value. Chance is usually determined by assessing whether chance or skill predominates. Consideration is what the person must pay to enter and must be something of value, such as money.

The first online gambling began in 1994 when Antigua and Barbuda passed the Free Trade & Processing Act, allowing gaming licenses to be granted to organisations applying to open online casinos. Online casinos would not have been possible without the development of gambling software paired with online security software to allow for secure transactions over the internet.

In 1996 the first regulation for online gaming activity came about through the establishment of the Kahnawake Gaming Commission (KGC).¹⁷ KGC regulates online gaming activity from the Mohawk Territory of Kahnawake and issues gaming licenses to many of the world's online casinos and poker rooms. This is an attempt to keep the operations of licensed online gambling organisations fair and transparent.

Internet gambling is a growing industry. During 1997 and 1998, online gambling gained popularity. Internet gambling websites increased from just 15 websites

in 1996, to 200 websites in 1997.¹⁸ According to a 2002 US GAO report,¹⁹ internet gambling operators established approximately 1,800 e-gaming websites in locations outside the US, and global revenues from Internet gaming in 2003 were projected to be US\$5bio. In 2008, H2 Gambling Capital estimates worldwide online gambling revenue at US\$21bio. Internet gambling has become one of the most popular and lucrative business present on the internet.

Efforts to control internet gambling did not meet with early success. In 1999, the US introduced the Internet Gambling Prohibition Act proposing to prohibit a company from offering any online gambling product to any US citizen but it did not pass. Multiplayer online gambling was also introduced in 1999. This was the first time people could gamble, chat and interact with each other in an interactive environment. US legislation finally succeeded in 2006 when the US Congress enacted the Unlawful Internet Gambling Enforcement Act ("UIGEA"), making it a crime to "knowingly accept" most forms of payment "in connection with the participation of another person in unlawful Internet gambling."

Whilst largely legal in most countries, multiple countries around the world have also taken legislative action to control internet gambling. In 2000, the Australian Federal Government passed the Interactive Gambling Moratorium Act,²⁰ making it illegal for any online casino not licensed and operating before May 2000 to operate. The new legislation meant Lasseter's Online became the only online casino able to legally operate in Australia; however, they cannot take bets from Australian citizens. India, France, Israel, Russia, and the UK, amongst others, have laws in place to control the downsides of this exploding industry.

Gambling money online can come from credit card, electronic cheque, certified cheque, money order, or even wire transfer. Normally, gamblers upload funds to the online gambling company, make bets or play the games that it offers, and then cash out any winnings. Gamblers can often fund gambling accounts by credit card or debit card, and cash out winnings directly back to the card. Due to the UIGEA most US banks, however, prohibit the use of their cards for the purpose of internet gambling, and attempts by Americans to use credit cards at internet gambling sites are usually rejected. A number of electronic money services offer accounts with which online gambling can be funded, however, many top fund-transfer sites have discontinued service for US residents. Payment by cheque and wire transfer is also common. Some gambling methods accept Bitcoin, a digital currency.

According to FATF, internet casinos are proving an attractive bet for criminals needing to launder their ill-gotten gains because of the difficulties encountered by the authorities in tracking such cyber transactions. Some criminals are already using online gambling as a cover for money laundering over the internet, the FATF said in its annual report on money laundering methods. Internet gambling not only makes it difficult to track money movements, but also to decide which jurisdiction has authority over a case.

The largely unsupervised electronic funds transfers inherent in online gambling can be exploited by criminal interests to launder criminal proceeds at the obscure "layering" stage of money laundering. Characteristics of internet gambling such as the volume, speed, and international reach of internet transactions and the offshore locations of internet gambling sites, promote a high level of anonymity and give rise to complex jurisdictional issues. Banking and gaming regulatory officials do not view internet gambling as being particularly susceptible to money laundering, especially when credit cards, which create a transaction record and are subject to relatively low transaction limits, are used for payment. Likewise, credit card and gaming industry officials did not believe internet gambling posed any particular risks in terms of money laundering.²¹ The risk, of course, intensifies when fund-transfer services, wire transfer and digital currencies are used, or where financial institutions accept an internet gaming entity as a direct customer.

Beyond organised crime, some legitimate companies have ended up in serious trouble by failing to comply with foreign states' laws where gambling is prohibited unless licensed locally in particular in the US who charged Pokerstars, Full Tilt Poker and Cereus (Absolute Poker/Ultimate Bet) with legal violations.

Before the US Government crackdown on online poker websites, there were around 2 million people playing poker for money on the internet in the US. After the action, the number of players dropped to around 500,000 with more expected to follow once accounts had expired. US poker players represented 49% of the 2006 global market and by 2011 after government intervention around 7%.

Charities & Not For Profit Organisations

"You shall give the due alms to the relatives, the needy, the poor, and the travelling alien..."

The Holy Koran

Introduction

Charitable giving and "good works" are a key tenet not only of the Islamic tradition but of many faiths including Hinduism, Judaism and Christianity and a major part of the way many secular people contribute and add value to the global community. Raising money for good works, particularly humanitarian relief in the major trouble spots of the world provides literally a lifeline for many. Whilst the vast majority of charitable donations are made and used for legitimate projects and make a tremendous difference to the lives of millions of people around the world, some funds inevitably may benefit illegitimate groups, by either directly or indirectly supporting terrorist groups or insurgent activity.

Definition / Description

Charities and Not For Profit Organisations ("NPOs") are organisations which do not operate for commercial profit or gain or for the direct or indirect profit or gain of its individual members or donors. The funds of such an organisation must be used to carry out the purposes of the charity or NPO, such purposes being either cultural, educational, religious or even professional. Tax exemptions are (where appropriate) often granted for registered charities or NPOs and contributions to them by donors are often tax deductible. Charities and NPOs accept funds for their activities and services from sources which include: public sources including government and supranational organisations and their agencies, the general public, legal entities, or single donors.

Examples of well known charities or NPOs include governmental, supranational and national bodies such as, the UNHCR, UNICEF and USAID, international organisations such as the International Red Cross and Red Crescent Organisations, Medicine Sans Frontier, Save the Children, the Salvation Army and Islamic Aid.

A subset of an NPO is Non-Governmental Organisation or NGO. NGOs perform on a voluntary basis, independent of government and have, in contrast to charities and NPOs, primarily political or quasi political or professional agendas which focus for example on particular causes bringing citizens to government, serving as early warning mechanisms and helping

monitor and implement international agreements. Some of the best known are Amnesty International, Human Rights Watch and Transparency International (TI), World Wide Fund for Nature (WWF) as well as the US based National Rifle Association (NRA) the American Israel Public Affairs Committee (AIPAC) being examples of the issue type of NGOs and the International Air Transport Association (IATA), the International Chamber of Commerce (ICC) and the International Organisation for Standardisation (ISO) being examples of professional representation NGOs. In the private foundation space the world's largest are the Gates Foundation (US\$37.4bio); INGKA Foundation (US\$36bio); and the Wellcome Trust (US\$22.1bio).

The definition/description of charities and NPOs including NGOs excludes a trust, foundation, domiciliary company or other legal entity established for or on behalf of an individual or family group. For more details see Part 2, Section 2, Sub-section 2, Gatekeepers below.

Money Laundering/Terrorist Financing Risks

The use of charities and or the misuse of charitable donations has been cited by FATF as a main source of terrorist financing. The UN as well as governments including the US and EU and elsewhere have also identified particular charities that they claim financially supported terrorist groups.

Whilst the concerns raised by FATF and government designations of certain charities appeared following the 9/11 attacks on America by Al-Qaeda and other major international terrorist atrocities like the 2003 Israeli bus bombings by Palestinian Terrorist Groups such as Hamas and Tamzin Fatah, the London 7/7, Madrid 3/11, and 2002 Bali bombings, the focus has been on the so called Islamic terrorist groups.

Whilst this focus is natural, the existence and operation of the Irish Northern Aid Committee (NORAID), a charitable front founded in the US to support IRA volunteers in their war against British Rule in Northern Ireland, for more than two decades from the 1970s and more recently the designating of the Tamil Rehabilitation Organisation (TRO) by the US and European governments in 2007 show that the misuse of charities for terrorism financing is not limited to the Islamic world. The US Department of Treasury stated that "TRO passed off its operations as charitable, when in fact it was raising money for LTTE ("Tamil Tigers") responsible for heinous acts of terrorism. In the US, TRO has raised funds on behalf of the LTTE through a network of individual representatives and TRO was the preferred conduit of funds from the US to the LTTE in

Sri Lanka".

It is not surprising though that Islamic charities, over the past decade have faced the most scrutiny. Charity forms a very important part of Muslim law and tradition. There is a recognised religious duty in the Muslim world to provide a set portion of earnings or assets for religious or charitable purposes (Zakat), and otherwise to support charitable works through voluntary deeds or contributions (Sadaqah). In countries like Saudi Arabia or the United Arab Emirates that have no established income tax system, the Zakat substitutes as the principal source of funding for religious, social and humanitarian organisations and activities.

The funds are collected by the government, or through local mosques and religious centres. Sadaqah contributions are also made directly to established Islamic charities. As both Zakat and Sadaqah are viewed as personal religious responsibilities there has traditionally been little or no government oversight of these activities. Donations in large measure remain anonymous. Elsewhere through the Islamic diaspora, particularly in the US and in Europe, these established principles of giving have generated significant sums of money for large organisations, often anonymously.

There are two major ways that charitable donations can be abused. Firstly, a Charity can be set up purely as a "cover" for terrorist fund raising and support. Secondly, it can be set up for legitimate reasons but has been wholly or partially established to move or distribute money for illicit purposes. Al-Qaeda, Al-Qaeda affiliates and other terrorist groups such as Hamas and Hezbollah have taken full advantage of the lack of oversight to open their own front charities and to solicit funds through collection boxes at mosques, Islamic centres and elsewhere. These groups have also placed operatives in key positions within established Charities to further their causes. Funds raised or allocated by or for Al-Qaeda, for example, are co-mingled, maintained and transferred with funds designated for legitimate relief and developmental activities. Their ultimate use in supporting the agenda of the terrorists group comes later when the moneys are transferred or diverted to terror connected recipients.

In 1996 the CIA issued a Report on NGOs with terror links, identifying a number of charities with links to Bosnian fighters during the wars in former Yugoslavia, some of which claimed connections with terrorist groups designated as such by the US. Examples of NGOs so identified included the Philippine and Indonesian branches some offices of the International Islamic Relief Organisation, the Bosnian and Somalian offices of the Al Haramain Islamic Foundation, Muwa-

faq Foundation.²¹ For more details see Part 2, Section 7 below.

Whilst charities and NPOs are now subject to government oversight, until fairly recently this oversight was rudimentary. Still in many parts of the world, this oversight remains likely light touch.

During the so called "war on terror" a number of charities have been accused by some of ties to terrorism. The following have been accused in some form:

Charities accused of ties to terrorism in US led "War on terror"

Gatekeepers

"Gatekeepers [including lawyers, fiduciaries and company service providers] are useful for money launderers due to their access to the financial systems, and area of expertise. Gatekeepers may be involved in money laundering for themselves or third parties."

Wolfsberg Group "Guidance on a Risk Based Approach for Managing Money Laundering Risks"

Introduction

Criminals require the services of these professionals to set up corporations, structures and vehicles to move and launder criminal monies out of sight, across jurisdictions, to advise on how to avoid and or circumvent the law and how to absorb the proceeds of crime within businesses and prepare illegitimate accounts. They may also add a veneer of respectability and provide credibility to a criminal enterprise. Notwithstanding this, the overwhelming majority of professionals, knowledgeable as they are and risk averse by nature, avoid such dealings and involvement.

Definition/Description

FATF have identified a class of businesses they call, "Designated Non-Financial Professions and Businesses (DNFPBs)" being professions and businesses that are seen as being attractive to money launderers and these are: casino's (when their customers engage in financial transactions above US\$/€3,000), lawyers, notaries, other independent legal professionals and accountants and trust and company service providers, dealers in precious metals and stones (when their customers engage in cash transactions above US\$/€15,000) and real estate agents.

Lawyers, notaries, other independent legal professionals and accountants are to be caught when they prepare for or carry out transactions for their client concerning the following activities: (i) buying and selling of real estate; (ii) managing of client money, securities or other assets; (iii) management of bank, savings or securities accounts; (iv) organisation of contributions for the creation, operation or management of companies; (v) creation, operation or management of legal persons or arrangements, and (vi) buying and selling of business entities.

Trust and company service providers are caught when they prepare for or carry out transactions for a client concerning the following activities: (i) acting as a formation agent of legal persons; (ii) acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;

(iii) providing a registered office, business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement; (iv) acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement; (v) acting as (or arranging for another person to act as a nominee shareholder for another person.

Lawyers, notaries, other independent legal professionals, and accountants acting as independent legal professionals, are generally not required to report suspicious transactions if the relevant information was obtained in circumstances where they are subject to professional secrecy or legal professional privilege. Also where lawyers, notaries, other independent legal professionals and accountants acting as independent legal professionals seek to dissuade a client from engaging in illegal activity, this does not amount to tipping-off.

The Wolfsberg Group "Guidance on a Risk Based Approach for Managing Money Laundering Risks" identified some characteristics of customers with potential higher money laundering risks, including, "Accounts for 'gatekeepers' such as accountants, lawyers, or other professionals for their clients where the identity of the underlying client is not disclosed to the financial institution."

Money Laundering/Terrorist Financing Risks

Gatekeeper's remain a common element in complex and/or opaque structures. As long ago as 1996, the FATF VII – Report on ML Typologies referred to so called "middle persons", such as lawyers, who assist in schemes such as depositing large amounts of cash, in this example that were tied to Russia and Eastern Europe, into the financial institution and then transferring the funds out of the country. Furthermore, the establishment and use of trusts has also been well documented, as noted in the FATF report titled, Money Laundering using Trust and Company Service Providers. The use of Trusts by criminals make it difficult for authorities investigating criminal activities to acquire the necessary insight and connections required for a successful investigation and prosecution especially when the investigation is from overseas. The FATF also noted, in their 2010 Global Money Laundering & Terrorist Financing Threat Assessment report, the increased use of these professionals, referred to as gatekeepers, for money laundering cases, "especially those involving significant financial fraud and organised crime. Criminals may seek out the gatekeepers to minimise suspicion of criminal activities due to the gatekeeper's reputation, presumed

ethical standards, and their expertise in disguising suspicious transactions/activity, as well as “take advantage of the professional secrecy obligations that may apply to the gatekeeper.”

In 2010 the US Senate Permanent Subcommittee on Investigations held hearings on “Keeping Foreign Corruption out of the US” and issued a report with the same title, which detailed four case studies in which US banks and professionals facilitated transactions that laundered money for foreign corrupt officials and their families. One of the cases involved *Teodoro Obiang*, the son of the President of Equatorial Guinea, who used his lawyer’s services to launder over US\$110mio in illicit funds through the lawyers clients account and through accounts of various shell companies. The Subcommittee used its findings from the hearing and the report to support regulations on attorneys, at least those involved in financial transactions, so called, “gatekeepers” to engage in customer due diligence, record keeping and reporting of suspicious activities by their clients. According to the FATF, “If one looks at the types of assistance that these professionals may provide, it is apparent that some of these functions are the gateway through which the launderer must pass to achieve his goals. Thus the legal and accounting professionals serve as a sort of “gatekeeper” since they have the ability to furnish access (knowingly or unwittingly) to the various functions that might help the criminal with funds to move or conceal.

Another meaningful example of how Gatekeepers can be used to facilitate money laundering is the case of *James Ibori*, a former Nigerian governor arrested and convicted of laundering corrupt monies.

Notwithstanding the identified risks and vulnerabilities presented by some so called “gatekeepers”, the organised legal and accounting professions have either attempted to avoid accepting many of the same obligations that are applied to financial institutions or where obligations are imposed sought to limit these and or contributed little in terms of suspicious activity Reporting. Many lawyers and accountants continue to claim that there is little established empirical connections between laundering and lawyer or accountant involvement.

Whilst it appears true that there is little empirical data there are some studies and data which albeit limited and small samples, nevertheless indicate that gatekeepers can and should play a role.

In a study called “My Brother’s Keeper: An Empirical Study of Attorney Facilitation of Money Laundering through Commercial Transactions”, the authors, Lawton

P. Cummings and Paul T. Stepnowsky, found that albeit in a small sample, in the US on the courts second circuit in 2009 of all cases prosecuted which included charges of money laundering, lawyers were involved in facilitating money laundering in 25% of the cases. Of that 25%, 40% related to direct activity by lawyers who were prosecuted themselves for active crimes and 60% where a lawyer was used albeit seemingly where the lawyer was an unwitting actor. Of this 60%, over 80% involved the purchase of real estate with, in many cases, the money passing via a lawyer’s account. In several of the cases, the crime related to mortgage fraud schemes. In some others the property was placed in the name of a third party to obscure the criminal’s identity and ownership of the asset. Only one case actually involved the creation of a legal entity for a criminal party. Finally the predicate crime which led to lawyer involvement in a transaction to launder the money where overwhelmingly white collar crime.

Whilst the data is not conclusive it indicates that in this case lawyers as gatekeepers may be an important asset in the fight against money laundering or alternatively can act as effective facilitators of financial crime. Some hide behind codes of ethics, laws of privilege and confidentiality which leaves law enforcement at a considerable disadvantage.

Whilst in this study offshore companies did not feature highly, they have been a feature in many of the most notorious money laundering schemes, but at the same time as they have been used for illegitimate purposes, like cash, that should not imply that their principal purposes and usefulness should be questioned.

Offshore Companies

Offshore companies are called many things, though the most popular name is IBC – “International Business Company,” though other names are frequently used such as “non-resident companies”, “exempt companies”, “special license companies”, PIC’s or “Private Investment Companies”, “Shell Companies”, “Off the Shelf Companies”, “Brass Plate Companies”, and no doubt numerous more. The companies come in two types, ordinary registered share companies and bearer share companies, the latter being perceived as presenting ever greater money laundering risks. There are alternatives to companies as legal structures, that are owned or controlled ultimately largely by individuals, including: trusts, foundations, anstalts and stiftungs amongst the most well known.

One of the most popular offshore vehicle of all appears to be the IBC, incorporated in the British Virgin Islands (BVI), following the introduction of a zero-tax level for

all business in 2004. There are a number of legitimate primary purposes for these companies. One is tax minimization and the others include asset protection and confidentiality. Whilst these purposes may exist independently they often interlap and complement each other.

Whilst the BVI is widely acknowledged as having the greatest number of offshore companies registered (number three in total and number one by population per head - see below) there are several dozens of countries worldwide offering different sorts of financial and tax benefits.

Top Locations for establishing IBCs			
No	Location	Numbers	per 100 pop
1	Hong Kong	1,045	15
2	Delaware	945,000	104
3	BVI	473,000	1,995
4	Cayman Is	92,000	161
5	Jersey	33,000	34
6	Bermuda	17,000	25

Source: The Economist as at December 2012

The BVI IBC has a number of attributes which has made it particularly attractive, including: (a) total absence or minimum levels of taxation; (b) confidentiality, due to there being no sensitive personal information available on public files; (c) secrecy protection and few effective international information-sharing agreements; (d) corporate flexibility: no paid-up capital requirements, no requirement to state operational objects, minimum conditions on directors and shareholders, fast incorporation; (e) ease of management – shareholders’ meetings can be held anywhere, including by electronic means, flexible decision making process (f) minimum reporting – no audits, no tax reports, no financial information on the public files.

Gatekeepers, such as lawyers, notaries, accountants or company formation agents will normally be used to establish such vehicles and in so doing should check the bona fides of their customers.

Many offshore companies kept pre-prepared IBCs “on the shelf” awaiting activation. Often IBCs have other IBCs as corporate directors, officers and shareholders, with some describing these shells, within shells, within shells, like Russian Matryoshka dolls, which can make it difficult to identify true beneficial owners.

Once an IBC or other offshore company or other vehicle or legal entity is established, and despite the limited amount of public disclosure the company or entity

will usually open a bank account, though unless there is some connection with the jurisdiction of the country where the IBC is incorporated the account will usually be opened offshore, for example in a financial centre or in a country that is known as a “financial centre”. Examples of widely known financial centres are UK (City of London), Manhattan, in New York City; Switzerland, Austria, Luxembourg, Singapore, Cayman Islands, the Bahamas and the Channel Islands.

Notwithstanding the limitations on disclosure on acquiring an IBC, to open a bank account in the name of the offshore company, is only possible at a reputable bank if detailed personal and business information also about the owners and controllers of the offshore company are provided. In particular, the bank will need to know and identify the actual beneficial owner(s) of the offshore company. All such persons, as well as everyone who will be granted account signatory rights, will have to be properly identified and will have to provide a number of documents - such as a certified passport copy, perhaps a reference, and explain the purpose of the company and the expected usage of the account and the source of funds for moneys being credited to the account.

Foundations including Anstalts and Stiftungs

Foundations are the creation of civil law countries which include virtually all Continental countries apart from Cyprus, Gibraltar and Malta and have also emerged in places like Panama.

The first key benefit of a foundation is that it owns its own assets and not, as with a private limited company, owned by its investors/shareholders - be they beneficial owners or nominees. The second key benefit of a foundation is that it will be treated as analogous to a private limited company at least under English Law and most likely by other major common law countries. The closest analogy to a foundation is the common law discretionary trust but unlike a trust, a foundation is generally treated like a private limited company, without applying to it the provisions of trust legislation applicable in most common law countries. It is also often possible for a founder (or ‘originating party’ if the funds are not directly lodged) to maintain greater control over lodged foundation assets than in the case of a common law trust. Most foundations will have not only a charter document (generally recorded with a companies registry) but also a regulatory governing document. This, whilst not on public record, is vital if an individual’s bespoke provisions are to be achieved especially in respect of beneficiary and determination issues.

Whilst public foundations can be established in virtually any civil law country, the three most popular jurisdictions for private interest foundations for both legal and tax reasons are Liechtenstein, Panama and Switzerland.

High Value Goods Dealers

"The use of large cash payments has repeatedly proven to be very vulnerable to money laundering and terrorist financing."

EU Third Money Laundering Directive 2005 preamble

Introduction

Businesses that offer high value luxury goods should recognise that not only are their products acquired by those with legitimate wealth, but they are also a target of criminals, both from a pure desire for commercial consumption, to improve perceptions about social standing but also by criminals wishing to launder the proceeds of crime or convert proceeds from cash into non-bankable assets. Businesses that offer high value luxury goods such as works of art, auctioned items, cars, planes, jewellery, real estate, and yachts and other property such as watches, wine and champagne, thoroughbred horses, pedigree dogs, to name some of the most important, need to take care that the purchaser and/or if the price is being paid in cash is legitimate.

Any product that offers the opportunity to criminals to convert cash or other valuables can assist criminals to launder their ill gotten gains; High Value Goods, offer both a more attractive alternative asset class than traditional financial products, and retain elements of confidentiality and convertibility as well as being used to launder very large sums.

Definition/Description

FATF have identified a class of businesses they call, "Designated Non-Financial Professions and Businesses (DNFPB's)" being professions which are seen as attractive to money launderers and these are: Casino's, (when their customers engage in financial transactions above US\$/€3,000), lawyers, accountants and trust and company service providers, dealers in precious metals and stones (when their customers engage in cash transactions above US\$/€15,000) and real estate agents.

The EU in its Third Money Laundering Directive 2005 have gone further than the FATF requirements and included a broad category of dealers who trade in goods (but not services), where payments in cash are made in excess of €15,000, and who need to register and implement an AML programme and file SARs as appropriate. The EU in its proposed 4th Money

Laundering Directive is intending to reduce this to €7,500. Other major jurisdictions outside the EU have yet to follow this broad more extensive approach, instead largely focussing on regulating DNFPBs alone.

Money Laundering/Terrorist Financing Risks

As well as art, criminals have invested or converted their ill-gotten gains or illicit funds into all kind of goods, but the most important appear to be planes, boats, particularly yachts, luxury automobiles or premium sport cars, real estate, wines and champagne, animals, watches, jewellery and of course apparel including clothes and shoes through auction or by private sale. The special attraction of these goods is not only that they are expensive and therefore guarantee a significant level of turnover of illicit funds, but they are also prime status symbols, which to some for example, kleptocrats, are important to show to the world the wealth accumulated in the most direct manner possible.

Top 10 most powerful luxury brands in the world		
Brand	Overall Brand Value	
1 Louis Vuitton	US\$19.78bio	
2 Hermes	US\$8.47bio	
3 Gucci	US\$7.59bio	
4 Chanel	US\$5.55bio	
5 Hennessy	US\$5.37bio	
6 Rolex	US\$4.74bio	
7 Moet & Chandon	US\$4.28bio	
8 Cartier	US\$3.96bio	
9 Fendi	US\$3.20bio	
10 Tiffany & Co	US\$2.38bio	

Source: Millward Brown Optimor (part of WPP) - 2009

The Annual Bain Luxury Goods Worldwide Market Study published in October 2012 includes figures on global spending for a number of high value goods. On luxury cars, the spending is US\$381 bio (up 4% compared to 2011), and for yachts US\$9 bio (up 2% compared to 2011). Those are impressive figures and give an indication on the size of the global industry supporting the market of luxury goods.

Whilst much of the sales of these luxury items are legitimate, clearly the market is deep enough for criminals to exploit. Beyond kleptocrats, organised criminal gangs like the drug trafficking cartels in Mexico and Colombia have invested vast amount of their illicit funds into luxury items. For example, the deceased

Colombian drug lord, Pablo Escobar, was well known for his extensive and highly prized car park and Mexican Cartels have taken things a step further, in addition to seeking luxury goods, they have acquired boats and planes of the more practical size, using these to transport drugs from the producing countries to intermediate locations and then on to the US.

Auctions

Whilst auction houses are famous for their sales of art, much more than art is sold by auction, including jewels and real estate, livestock, wine and watches. Traditional auction houses, such as Christie's and Sotheby's with a long heritage going back over hundreds of years, hosting auctions of the world's finest art and artefacts, dominate these public sales in which goods or property are sold to the highest bidder. At the end of 2011, Sotheby's had an auction of contemporary art with sales of US\$200mio in a single night. Yet, the best year for a traditional auction house went to its rival Christie's, which generated approx US\$6bio. Nevertheless, with new technology, the auction business albeit not really focussed on the luxury market which dominates is eBay, which started out with an idea for a simple auction system, and now generates US\$150bio in sales a year. The "micro" auctions that typify eBay's auction model are an alternative albeit more volume related vehicle to launder illicit funds as are the online games that involve virtual auction houses that facilitate the transfer of real money. The following provides a brief summary of certain luxury markets and some of the most expensive purchases to date.

Art

Works of art may include a multitude of disciplines ranging from fine art in the form of painting, photography and sculptures to literature and music. For AML purposes, the term art has to be thought of in broad terms to include culturally significant antiquities. In addition to money laundering involving such items, one should bear in mind other crimes related to art and antiquities. For example, see Part 1, Section 1, Fraud and Environmental Crime.

The most expensive paintings purchased include "the Scream" by Edvard Munch, which sold at Sotheby's at auction in 2012 for a record US\$120mio (but which has recently been topped by the sale of Francis Bacon's Lucian Freud which sold for US\$142mio). The painting is actually one of four versions painted by Munch and the only version whose frame was hand-painted by the artist to include his poem, detailing the work's inspiration. The Scream or the Screams have been the target of a number of thefts and theft attempts, with two of the four being stolen but retrieved later. The previous

record for the most expensive work of art sold at auction had been held by Picasso's Nude, Green Leaves and Bust, which went for US\$106.5mio at Christie's two years prior in 2010 and before that the previous record was held also by Picasso's Boy with a Pipe, a painting that sold for US\$104mio. When accounting for inflation, the highest price paid for art at an auction is still held by Van Gogh's Portrait of Dr. Gachet, which sold for US\$82.5mio in 1990, or about US\$147mio in 2012 equivalent money. Outside of auction, Jackson Pollock's Number 5, painted in 1948 reached a price of US\$140mio and whilst unconfirmed there have been reports that "The Card Players" by Cézanne, sold privately for US\$250mio in 2011. Beyond paintings, drawings and even photographs have commanded high prices. The most expensive drawing was sold at auction in 2009 by Christie's in London. Raphael's Head of a Muse, a black chalk drawing on paper, sold for almost US\$50mio. Andreas Gursky is well-known for his stunning full-color landscapes, though the world's most expensive photograph, costing US\$4.3mio was Rhein II a large print of the famous German river, which seems to only include green and grey. As far as sculpture goes, the record here goes to Giacometti's sculpture of the "Walking Man I" for US\$104.3mio, easily beating the most expensive sculpture from antiquity, the Roman-era statue, "Artemis and the Stag" which sold in 2007 for US\$28.6mio. As far as books or manuscripts are concerned, the highest price recorded for a printed book was until recently a copy of John James Audubon's "Birds of America" which sold for US\$1.5mio at Sotheby's in 2010. This was topped in 2013 by a book which sold for just under US\$14.2mio also at Sotheby's in New York. The book a translation of the Biblical psalms, from the original Hebrew, called, "The Bay Psalm Book", was printed by Puritan settlers in Cambridge, Massachusetts in 1640 just 20 years after the Pilgrims landed at Plymouth and is considered to be the first book printed in what is today the United States of America. Notwithstanding this sale of a printed book, the auction record for any book goes to the Leonardo da Vinci Codex Hammer, a personal notebook of scientific writings and diagrams, which sold for US\$30.8mio at Christie's auction house in 1994.

Jewels and Real Estate

For more details see Precious Metals and Stones Dealers and Real Estate Agents below in this Part 1, Section 2, Sub-section 2.

Planes, Automobiles and Yachts

Luxury private jets range from about US\$31mio for a Bombardier Global 5000 to US\$65mio for the Gulfstream G650. For the seriously wealthy there is a trend to take even Boeing and Airbus large passenger

jets and upgrade them, fitting them out for personal use. Airbus lists a price of US\$68mio for its smallest single-aisle A318 to about US\$245mio for the twin-aisle A350, which is under development.

For Boeing the most expensive private jet is the Boeing 747-8 VIP at a price of US\$295mio. Boeing has sold seven 747-8 VIPs where the interiors are fitted out by the customers own designers, to look more like a luxurious home than like a plane, which can add still millions more onto the total cost.

At Airbus, the company lists its new A380 double-decker at US\$389.9mio before any upgrades. After taking the order in 2007, Airbus delivered the behemoth jetliner to a single customer in 2013, the Saudi Prince Alwaleed bin Talal, the Chairman of The Kingdom Holding Company. It is considered the most expensive personal jet, with a final price in excess of US\$500mio. The original plans included a garage for two Rolls-Royces, a stable for horses and camels, a pen for hawks and a prayer room that rotates so it always points toward Mecca.

Other notable large jet owners include Google's founders, Sergey Brin and Larry Page, who bought a secondhand Boeing 767 in 2005 and turned it into their private plane and Hollywood actor, John Travolta who somewhat differently flies his own vintage Boeing 707.

The most expensive new car in the world is the Bugatti Veyron Supersport. This Bugatti is made in France and has a 16 cylinder – 1,200 horsepower engine. The Bugatti hits 0-60 mph in 2.6 seconds with a top speed of 268 mph and a price of US\$2,600,000. Vintage classic cars can cost much more however. For example, the Mercedes-Benz W196, which won the Grand Prix in 1954 and 1955, sold at auction in 1990 for US\$24mio recently topped by the sale for US\$26mio for a Mercedes Benz W196R (driven by Fangio in F1 wins in 1954 in Germany and Switzerland) and a 1962 Ferrari 250 GTO which became the most expensive car ever when it was sold in the UK to a private collector for US\$35mio.

Motorcycles naturally are less expensive, though the most expensive Motorcycle, the "Dodge Tomahawk V10" costs US\$700,000. It is a 1,500lb. motorcycle with four wheels, has a Dodge Viper's V10 engine and can go from zero to 60 mph in 2.5 seconds, with a top speed estimated to be more than 300mph.

The world's most expensive private yacht is the Eclipse, which cost Russian Oligarch, Roman Abramovich, US\$590mio. Built in 2010 and is just over 538ft long,

the Eclipse can accommodate up to 30 guests in 15 cabins and also cater for 75 crew members. It has two helipads, 11 guest cabins, two swimming pools, three launch boats, an aquarium, and a minisubmarine that can dive to 50 meters below the ocean surface. The master bedroom and bridge have bulletproof glass, and the security system includes missile detection systems that warn of incoming rockets. Interestingly it can be privately charted for approx US\$2mio per week, plus expenses (notably US\$650,000 for a single fuel fill-up).

The yacht that comes in second place was built for Prince Jefri Bolkiah of Brunei and is called, "Dubai" measuring 162 metres long. The seven decks of the yacht house, among other things, has a mosaic swimming pool and multiple Jacuzzis. Not only that, the ship can accommodate a 9.5 ton helicopter and two smaller 10-meter long tenders. A glass staircase adds brilliance to this most lavish and expensive yacht.

A long way behind both Eclipse and Dubai are two Yachts the first a new Yacht shown at the 2012 Singapore Boat Show and the second owned by an American businesswoman at the Dubai Boat Show. The first the "Helix" is priced at US\$44.5mio and is 45 meters long, whilst the Andiamo is shorter at 42.5 meters long and costs US\$24.5mio. The Andiamo is called the Rolls-Royce of the sea.

Animals

Horse racing, and equestrian sports and skill have a long and distinguished history, with thoroughbred racing long popular amongst the rich and noble earning it the title "Sport of Kings." The most expensive horse purchased at auction was called, "Green Monkey" and was the descendant of two US Kentucky Derby winners, costing US\$16mio. Unfortunately the horse ran in three races, but only managed one third place. One of the most successful horses of recent times, "Frankel" retired in 2012 unbeaten in his fourteen race career in the UK being billed as the highest-rated racehorse in the world. Whilst he is not for sale, estimates of his value top £100mio. The valuation is based on the his future stud fees, which have been set at £125,000. In his first season as a stallion he will cover approximately 130 mares.

The most popular dog breeds are not the world's most expensive dog breeds, but the luxury dogs rate high at the top of the list. Popular dog breeds change from year to year and from country to country; and so do the most expensive dogs in the world. There are a variety of factors which make dogs expensive. Purity of breed or their rarity can make dogs extremely expensive, alternatively being spotted in the hands of a major celebrity! The most expensive dog ever sold was a red

"Tibetan mastiff" called Big Splash, or "Hong Dong" in Chinese. This most expensive dog ever already stood nearly three-feet-high at the shoulder and weighs more than 180lbs at 11 months old. He was purchased by a Chinese multi-millionaire coal baron for approximately US\$1.5mio and beats the earlier record set by another Tibetan Mastiff called "Yangtze River Number Two" which was sold to a Chinese woman in 2009 for about US\$609,000. Whilst the most expensive cat breed is the Bengal cat, which is a hybrid cat that is a cross between a domestic feline and an Asian Leopard Cat, one of these cats sold for US\$42,000. Still whilst this breed is much sought after, it was a four-year-old former stray cat from Rome, "Tommaso" that could be really considered to be worth a fortune after inheriting approximately US\$13mio from a wealthy owner. Whilst Tommaso can count himself very lucky he cannot be considered unique as he is only the third most wealthy animal on the planet. He is preceded by Kalu the chimp, who was left US\$80mio when his owner passed away and Gunther IV a dog who inherited US\$372mio from a German countess.

Watches

The President of the US, Barack Obama, wears a Tag Heuer 1500 Professional Series. Former President Bill Clinton, on the other hand, sports a Panerai.

No	Most Expensive Watches sold at Auction	
1	Chopard 201-Carat Watch	US\$25mio
2	Patek Philippe Henry Graves Super Complication Pocket Watch	US\$11mio
3	Patek Philippe Reference 1527 Wristwatch	US\$5mio
4	Breguet & Fils, Paris No 2667 Precision Watch	US\$4,682,165
5	Louis Moinet Meteoris Watch	US\$4,599,487
6	Patek Philippe 1939 Platinum World Time Watch	US\$4,026,524
7	Patek Philippe 1928 Single-Button Chronograph Watch	US\$3,637,408
8	Piaget Emperador Temple Watch	US\$3.3mio
9	Patek Philippe 1953 Model 2523 Heures Universelles Watch	US\$2,899,373
10	Cartier Secret Watch with Phoenix Decor	US\$2,755,000

Source: Author

The former French counterpart, once called President bling bling, Nicolas Sarkozy, has a Rolex. In Hollywood, Daniel Craig wears a Rolex Daytona, and not the Omega that is a fixture in James Bond movies. Sylvester Stallone, meanwhile, prefers a Panerai Submersible, while multiple Academy Award winner Tom Hanks has been seen with either an Omega PO or a Rolex Milgauss GV. In the world of sports, Miami Heat superstar and the reigning Most Valuable Player in the National Basketball Association Lebron James has worn an Audemars Piguet Royal Oak Offshore. Whilst there are many reasons to prefer a particular type of watch, accuracy, complexity, adorned jewellery, scarcity or just style, the most expensive watch has many of these qualities though it is more jewellery than watch, being heavily adorned with jewels. It is the Chopard 201-Carat Watch which sold at auction at US\$25mio.

Wine and Champagne

Everyone knows the older the wine, generally, the better it gets up to a point at least. Vintage wines are chosen from some of the most exceptional vineyards and may sell for thousands of dollars per bottle. Some of the rarest bottles in the world have attracted record prices. Considered the most expensive standard bottle is a Chateau Cheval Blanc 1947 that has been given A class status in the Classification of Saint-Emilion wine. According to Christie's wine expert, Michael Ganne, this is the only known bottle in the imperial format and can be kept for another 50 years without any problem. One of the greatest Bordeaux of all time, the bottle was owned by an anonymous Swiss collector. The wine was sold at an auction at Christie's in Geneva and was sold for US\$304,000. Another very expensive wine is the Chateau Lafite-Rothschild 1869. Three bottles of 1869 Chateau Lafite Rothschild were sold in Hong Kong at auction going for US\$232,692 each. The fact that made the bottles rare was they came directly from the Chateau Lafite's cellars.

The single most expensive bottle of wine ever sold was a "Screaming Eagle Cabernet Sauvignon 1992" which was purchased with the proceeds going to charity at the Napa Valley Wine Auction in 2000 by Chase Bailey, a former Cisco Systems executive for US\$500,000. The bottle was a gigantic 6 litre bottle however, so taking size into account the Cheval Blanc is for its size still the most expensive. The most expensive Champagne was the "Heidsieck Monopole Champagne 1907" which were recovered in 1997 from a ship that sank in the Baltic Sea. Over 200 bottles were being shipped to the Russian Imperial family in 1916 but were lost at sea en route. The Ritz-Carlton Hotel in Moscow claimed 10 of the bottles and made them available for sale in 2008, the first being sold for US\$35,000.

Intermediaries

"All things can corrupt when minds are prone to evil"
Ovid, Roman poet active in BC & AD²²

Introduction

Intermediaries have been used throughout history, as buyers and sellers of goods and services have used middlemen to access local markets, including obtaining local market intelligence to gain an advantage over competitors. Increased focus on combating bribery and corruption has resulted in scrutiny over the use of middlemen in all sorts of business sectors. Intermediaries are perhaps the most prominent in sectors trying to access the emerging markets and procurement of government contracts, especially where such contracts relate to the natural resources or the energy sector. This is not to say, however, that every time an intermediary is appointed, that the arrangement is suspect or is performed with criminal intent.

Definition/Description

According to the Wolfsberg Group in their "Guidance on a Risk Based Approach for Managing Money Laundering Risks", the "use or involvement of intermediaries within the relationship" was identified as posing increased risks. The Wolfsberg Group Anti Corruption Guidance²³ defines an intermediary as "third parties that are engaged, directly or indirectly, by the financial institution to act on their behalf to find, introduce, obtain or maintain business, clients or licences for the financial institution, or who introduce the financial institution to government officials or government enterprises, irrespective of whether a transaction is completed". The OECD Working Group on Bribery in International Business Transactions provides a broader definition²⁴ of what an intermediary is, that is "a person who is put in contact with or in between two or more trading parties" and states that "the intermediary can act as a conduit for legitimate economic activities, illegitimate bribery payments, or a combination of both". Intermediaries can be: (i) agents; (ii) sales representatives; (iii) consultants or consulting firms; (iv) suppliers; (v) distributors; (vi) resellers; (vii) sub-contractors; (viii) franchisees; (ix) joint venture partners; (x) subsidiaries, and (xi) other business partners including lawyers and accountants.

Money Laundering/Terrorist Financing Risks

Whilst the use of intermediaries is commonplace in commerce, and the vast majority perform legitimate services, often helping with technical expertise, or local knowledge, communication, custom, practice or contacts especially in far away places, Intermediaries can

also be used as part of a corrupt transaction.

The OECD²⁵ states that intermediaries can legitimately be used in order to assist/give guidance to companies looking to work in unfamiliar environments, particularly new geographical jurisdictions. In these cases, intermediaries perform a legal and vital service, giving guidance on cultural, legal and financial complexities and obligations, or providing access to closed/insular markets. They can also act as local employees when it is impossible or difficult for an international company to relocate or employ other individuals, due to legal or financial restrictions. The issue therefore, is intent, and whether there is an intent to use an intermediary to corruptly influence key decision makers, be they government officials or other corporations.

For example, an important public official in a position of power to influence business decisions may direct a tendering company to deal first with a nominated intermediary, perhaps someone related to the family of the official, a friend or other third persons act as an intermediary, someone who will be paid a large commission, perhaps upfront, for very limited actual services, with the expectation that the commission payment will find its way to or benefit the official.

Whilst there is likely to be no written agreement or direct evidence of a bribe, the set up and circumstances are highly suspicious. The company paying the intermediary will generally know, or at least should reasonably suspect, that the payment being made is a bribe. The corrupt official will elect to have payments sent on from the intermediary to a family member or a close associate typically in an offshore jurisdiction.

An integral part of any successful money laundering corruption scheme is to create distance: for corruption between the corrupt individual and their deeds, and in money laundering between the origin of the criminal assets and their "clean" end, in order to evade detection, prosecution and conviction. Crucial to both these ends is the use of intermediaries that can create distance between and obscure the origin of corrupt/criminal payments or instructions.

Corrupt PEPs will, for example, take great pains to disguise the identity and the source of the funds in order to place corrupt money in the financial system without suspicion or to receive illicit funds/bribes. There have been numerous examples in corruption cases, where the corrupt individual has used an intermediary in order to access financial services, or to act on their behalf.

Money Services Businesses

"International money remittances were estimated at US\$400bio in 2012 much of which flowed via Money Services Businesses largely from immigrant workers sending money home to family and friends."

World Bank's November 2012 Migration and Development Brief

Introduction

A 2005 US DEA study determined that alongside; (i) bulk currency smuggling and the use of US based money remitters, the other major money laundering threat relating to the movement of drug proceeds to Mexico were the Mexican currency exchange houses, referred to as Casa de Cambios and Centros Cambiario. In 2006 FINCEN advised all US financial institutions formally about this threat. In 2010, US and Saudi Arabia, respectively, were the top two senders of remittances, with more remittance providers in the US than the next nine Countries combined.

Number of MSBs providing Remittances		
1	US	25,000
2	UK	2,818
3	HK	2,008
4	Mexico	1,085
5	Dermark	334
6	Argentina	122
7	Sweden	96
8	Finland	70
9	Spain	46
10	Germany	38

to individuals who may not have ready access to the formal banking sector. MSBs are often closely located to particular neighbourhoods which they serve, particularly immigrant populations where cheque cashing, currency exchange and international remittance services are required, or close to borders where tourists and commerce flow, they often offer cheaper rates for their services than banks, and they do not require the opening of an account to process transactions. As far as pure currency exchangers Poland, the US and Mexico make up the top three.

Currency Exchange Numbers		
1	Poland	4,193
2	US	3,294
3	Mexico	2,757
4	Spain	2,256
5	HK	2,008
6	UK	1,404
7	Serbia	1,781
8	Croatia	1,242
9	Ukraine	1,104
10	Georgia	1,050

According to the World Bank's November 2012 Migration and Development Brief international money remittances were estimated at US\$400bio in 2012 much of which flowed via MSBs largely from immigrant workers sending money home to family and friends. Estimates that remittances to developing nations will continue to grow by 6.5% in 2013.

In Asia the big net recipients of remittances are India, China, Philippines, Bangladesh and Vietnam. Most of the remittances happen by the conventional channel of agents, like Western Union, UAE Exchange, MoneyGram or Xpress Money Services. However, with the increasing relevance and reach of the Internet, online and mobile phone money transfers from companies such as Remit2India and Xoom.com have grown significantly.

In Latin America and the Caribbean, remittances play an important role in the economy of the region, totalling over US\$ 66.5bio in 2007, with about 75% originating in the US (95% when it comes to Mexico). This total represents more than the sum of foreign direct investment and official development aid combined. In seven Latin American and Caribbean countries, remittances even account for more than 10% of GDP and exceed the dollar flows of the largest export product in almost every country in the region. Percentages ranged from 2% in Mexico, to 18% in El Salvador, 21% in Honduras, and up to 30% in Haiti.

A significant study conducted by the Inter-American Development Bank (IDB) in 2004 provides useful insight into remittance and related migration patterns between Latin America and the US. The study reveals that over 60% of the 16.5 million Latin American-born adults who resided in the US at the time of the survey regularly sent money home. The remittances sent by these 10 million immigrants were transmitted via more than 100 million individual transactions per year and amounted to an estimated US\$30bio during 2004. Each transaction averaged about US\$150–US\$250, and, because these migrants tended to send smaller amounts more frequently than others, their remittances had a higher percentage of costs due to transfer fees. Migrants sent approximately 10% of their household incomes; these remittances made up a corresponding 50-80% of the household incomes for the recipients. Significant amounts of remittances were sent from 37 US states, but 6 states were identified as the “traditional sending” states: New York (which led the group with 81% of its immigrants making regular remittances), California, Texas, Florida, Illinois, and New Jersey. The high growth rate of remittances to Mexico (not the total amount) is unlikely to continue. In fact, according the Mexican central bank, remittances grew just 0.6 during the first six months of 2007, as compared to 23% during the same period in 2006. Experts attribute the slowdown to a contraction in the US construction industry, tighter border controls, and a crackdown in the US on illegal immigration.

Remittances to Africa play an important role also to national economies, but little data exists as many rely on informal channels to send money home. Today's African diaspora consists of approximately 20 to 30 million adults, who send billions annually to their families and local communities back home. For the region as a whole, this represents 50% more than net Official Development Assistance (ODA) from all sources, and, for most countries, the amount also exceeds Foreign Direct Investment (FDI). In several fragile states, remittances are estimated to exceed 50% of GDP. Most African countries restrict the payment of remittances to banks, which in turn, typically enter into exclusive arrangements with large money transfer companies, like Western Union or Money Gram, to operate on their behalf. This results in limited competition and limited access for consumers, although there are a number of new players aiming to disrupt this established Money Transfer Operator (MTO) model, such as Xoom and Willstream, which leverage increasing mobile phone penetration in the region and provide different rate structures to diaspora customers. The World Bank though noted that “Cross-border mobile remittances have not taken off due to a variety of regulatory and operational challenges with mobile remittances falling into a regulatory void between financial and telecom regulations which creates regulatory uncertainty for potential market entrants”. According to a World Bank study, Nigeria is by far the top remittance recipient in Africa, accounting for US\$10bio in 2010, a slight increase over the previous year (US\$9.6bio). Other top recipients include Sudan (US\$3.2bio), Kenya (US\$1.8bio), Senegal (US\$1.2bio), South Africa (US\$1.0bio), Uganda (US\$0.8bio), Lesotho (US\$0.5bio), Ethiopia (US\$387miln), Mali (US\$385mio), and Togo (US\$302mio). As a share of GDP, the top recipients in 2009 were: Lesotho (25%), Togo (10%), Cape Verde (9%), Guinea-Bissau (9%), Senegal (9%), Gambia (8%), Liberia (6%), Sudan (6%), Nigeria (6%), and Kenya (5%).

Since 9/11, the FATF and member countries have taken steps to address the risks of MSB and informal value transfer systems.

The internationally co-ordinated effort to address money laundering and terrorist financing has likely increased the cost of sending remittances, which in turn has likely increased the amount of remittances sent through informal channels (family connections, travelling friends, local money lenders etc.).

Definition/Description

MSBs are non-bank entities which provide transfer and exchange mechanisms. People generally use MSBs to exchange or transfer value, or to purchase or redeem negotiable instruments. Depending on the jurisdiction, a MSB may be defined as an individual or an entity that is engaged in the business of any of the following activities:

- foreign exchange dealing;
- remitting or transmitting funds by any means or through any individual, entity or electronic funds transfer network; and/or
- issuing or redeeming money orders, traveller's cheques or other similar negotiable instruments.

MSBs are sometimes known as Casa de Cambio, Exchange Houses, Cheque Cashers, Money Transmitters, Currency Dealers, etc. and can include unregulated or informal MSBs or alternative remittance systems (ARS) such as hawala, hundi, undiyal, fei ch'ien, chitti, or other informal value transfer systems.

Money Laundering/Terrorist Financing Risks

MSBs provide a range of unique, valuable, and competitive financial services for domestic and international customers, and while the variety of MSB types and sizes can provide consumers with expanded choices, it also means that the sector has unique challenges and risks and have shown themselves especially vulnerable to misuse for money laundering and terrorist financing.

Particular concerns exist around the use of MSBs by organised crime and in particularly drug traffickers in Latin America to launder drug money as well as tax fraudsters and evaders and terrorist groups to move money.

Since the mid-1990s, US bank regulators and drug enforcement investigators have been warning that Mexican MSBs in particular, Casas de Cambio pose a significant money laundering risk. Casas de Cambio allow people and businesses for example in Mexico to exchange or wire transfer the value of currency to bank accounts in the US and other countries, via accounts they hold with banks (see Correspondent Banking in Part 1, Section 2, Sub-section 3, Products and Services Risks below). The Casas de Cambio in Mexico, and elsewhere in Latin America, are notorious for dealing and involvement with funds from and to drug traffickers which are then processed via correspondent accounts at US or foreign banks. It is unsurprising that Casas are involved as so much of the Mexican economy is connected with organised crime and drug trafficking, and the risks as such may also exist therefore with other

financial services businesses including banks in Mexico

Common techniques most illustrative of how MSBs can be exploited for money laundering and terrorist financing purposes include structuring and attempting to circumvent MSB record keeping requirements that would disclose the MSB client's identity; attempting to circumvent MSB identification requirements; smurfing, using nominees, or other proxies; exploiting negotiable instruments such as money order and bank cheques; and refining small bills into larger transactions.

A Casa de Cambio is an exchange house operating extensively throughout Mexico and in the US on the US/Mexican border. The US government has warned that Casa de Cambios are commonly used by money launderers. A Casa de Cambio in the US may collect several transmittal orders for small amounts from different individuals wanting to send money to relatives in Mexico. The Casa de Cambio then bundles them into a single transmittal order to a US bank as part of a transmittal of funds to a Mexican Casa de Cambio. The single transmittal order does not identify all transmitters or recipients of the underlying order. The US bank simply sends the single transmittal order to the Mexican bank which then pays the Mexican Casa de Cambio which then pays the Mexican recipients based on the separate transmittal orders received directly from the US Casa de Cambio. See Part 2, Section 7 Pedro Allatore and Casa de Cambio Pueblo, Beacon Hill and Lespan and Part 2, Section 8 , HSBC, Wachovia and Sigue Corp, all of which led to enforcement actions against the financial institutions.

Another area of particular money laundering and terrorist financing risk involves Unregulated Money Service Businesses.

Unregulated Money Service Businesses (UMSB)

UMSBs are any entity which is engaged in the business of a money services business but which is not properly licensed, regulated and as such is not required to operate an AML Programme.

Examples of UMSBs can include unregistered ARS sometimes known as integrant banking, informal funds transfer systems, hawala (Islamic countries), hundi (India), undiyal, fei ch'ien (China), chitti and Black Market Peso Exchange (South America), Chop (China), or other informal value transfer systems (IVTS). For a variety of socio-cultural and economic reasons, ARS are pervasive in many parts of the world. ARS provide a cost-effective means of moving money, particularly in those parts of the world which have little or no formal banking infrastructure. Since ARS usually operate on

the basis of trust between remitters (and intermediaries acting on their behalf), they are able to persist outside of the normal financial system and avoid regulatory controls, and may not record clients and transactions in the way that registered MSBs must do. As useful as ARS may be to a wide variety of financial services consumers, a number of jurisdictions and international bodies have identified ML/TF risks linked to the possibility of anonymity which ARS can provide, and in relation to risks associated with the lack of recordkeeping and absence of report filing. Unregistered MSBs and ARS systems do not submit mandatory transaction reporting and create opportunities for anonymity within the financial system. These issues could create AML/CTF vulnerabilities and also create investigative obstacles. Unregistered remittance businesses should also be a concern for the MSB sector in that these operations can create reputational risks for registered MSBs and other financial institutions which may ultimately be used (knowingly or not) as settlement mechanisms for an unregistered remitter who could potentially be facilitating illicit financial activity. The most common point of contact between a UMSB and formal sectors lies in the bilateral or multilateral process of financial settlement of debts with other dealers/operators incurred as a result of the trust-based transactions common to these remittance systems.

Increasingly, UMSBs are evolving from store front operations where customers drop off cash to e-currency, digital businesses where remitting party and beneficiary are completely opaque, with customers engaging with a decentralised host with no obvious domicile or location.

FATF released a typology on ARS in 2005 and developed the Special Recommendation VI now Recommendation 14 in response.

Chop

Chop is a Chinese alternative remittance system. It works the same way as the Hawala system, but while Hawala is more based on trust and the extensive use of ethnic or familial connections, the Chop system relies on chops. The broker creates a chop, tears it into two pieces and gives one piece to the client and sends the other piece to his counterpart broker in the other country. The client sends his half of the chop to the recipient and the match of the two halves will provide evidence to the broker to release the money to the recipient.

Fei ch'ien

Fei Ch'ien a Chinese ARS and means flying money or coin. The system to transfer funds including tax revenues evolved during the latter half of the T'ang

Dynasty as a result of the growing commodity trade within China. Merchants from the southern part of China sold goods in the capital and transferred their revenues from the sales to agencies of their provinces where these revenues were used to pay taxes. These agencies issued certificates indicating the amounts paid by the merchants who would after their return present them to the provincial governments for payment of an equivalent sum of money. Through these transfers the merchants and couriers of the provincial governments could avoid the inconvenience and risk involved in transporting money physically over long distances. With the Chinese emigration in the 19th century the system became internationalised by the flow of remittances from the expatriates in order to support their families that stayed in China.

Hawala

Hawala is an ancient system for remitting money primarily in Islamic societies. Clients entrust money to hawala bankers who facilitate money movement worldwide through personal connections, sometimes using legitimate bank accounts, but leaving minimal paper trail which makes it easy for the hawaladars and their clients to avoid legal repercussions. The hawala triangle (Dubai, India and Pakistan) is responsible for the heaviest traffic in worldwide financial transfers. Hawala provides a fast and cost-effective method for worldwide remittance of money or value particularly in regions outside the reach of the financial sector. Since hawala payments provide security, anonymity and versatility to the user, the system can be easily misused for money laundering, terrorist financing and other financial crimes. However, in some countries they operate in parallel with formal financial institutions or as a substitute or alternative for them.

Hundi

Hundi is an alternative remittance system which works the same way as a hawala system but evolved in the Indian subcontinent and was spread to neighbouring countries. It used to be one of the main payment method in India even up to the 1960s.

For details about the Black Market Peso Exchange see Part 1, Section 1, Drug Trafficking; and about Cash Smuggling see Part 1, Section 1, Smuggling.

Politically Exposed Persons

"Power tends to corrupt, and absolute power corrupts absolutely. Great men are almost always bad men."

John Emerich Edward Dalberg Acton, Lord Acton, British historian and moralist 1887²⁵

Introduction

Public officials, particularly ones who attain important public positions and acquire power over their citizens as a result are neither innately bad nor corrupt. Most begin as honest men and women with honourable, patriotic, and even altruistic motives, wishing "to do good for the people" but the longer the time in power and the more senior the position held, it would seem the more likely the person is to succumb to weaknesses in morality, and to abuse the position of public trust to which they have risen.

Whilst not all senior public officials seek to attain and establish themselves in the way of absolute monarchies from antiquity and through the middle ages, where all power is given to, or, as is more often the case, taken by, the monarch, for example, Roman emperors (who declared themselves gods), Catholic Popes (Gods' chosen priest on earth), and Napoleon Bonaparte (who declared himself an emperor and above God!), some still remain and others still aspire to such heights. The more common abuse is the President, Prime or Senior Minister who increasingly over time becomes more abusive, placing restrictions on human rights, increasingly using force against the people, and surrounding himself with family members and cronies, appointing friends and supporters to lucrative positions or awarding them lucrative contracts, diverting public funds or foreign aid for grandiose projects or private enrichment. If there is meaningful opposition, an emergency may be declared or created to justify police or military action. Once a ruler is in power for long enough he will eventually confuse state assets for his own and no longer be accountable for his actions and will do what is politically and personally expedient. A prime example is the case of Sani Abacha who was President of Nigeria between 1993 and 1998. He was listed in 2004 by Transparency International as the fourth most corrupt leader of all time, with an estimated theft of state assets of at least US\$2-5bio. The term Politically Exposed Person (PEP) was indeed a term coined as a result of the Abacha case. The sheer size of the assets involved and the number of financial institutions involved across many major financial centres directly led to a re-evaluation and a recognition that

anti-money laundering controls in financial institutions needed to be enhanced.

Definition/Description

The Abacha case led at least to one government, in this case the Swiss Government, to react and to issue a directive to its banks in 1998 that first used the phrase Politically Exposed Persons. This was taken up by the Wolfsberg Group which joined together to issue their first statement covering private banking principles, covering expressly how to manage PEP relationships in 2000, leading to inclusion in a 2001 paper of the Basel Committee on Banking Supervision and then being formally adopted by FATF as a special category in 2003. Consequently, there are numerous definitions of PEP though many share the same characteristics. A Politically Exposed Person is a natural person who performs (or has performed) a prominent/important/senior, foreign public position. This definition includes anyone who is identified as being a close family member of, or closely associated with such an individual.²⁶

Money Laundering/Terrorist Financing Risks

Over the past 25 years, we have learned about the plunder of state assets by PEPs with TI listing in 2004 their most corrupt top 10 PEPs as follows:

Top 10 most corrupt leaders (as at 2004)			
No	Name	Country/Period	Amounts
1	Mohamed Suharto	Indonesia: 1867-1998	US\$15-35bio
2	Ferdinand Marcos	Philippines: 1972-1986	US\$5-10bio
3	Mobutu Sese Seko	Zaire: 1965-1997	US\$5bio
4	Sani Abacha	Nigeria: 1993-1998	US\$2-5bio
5	Slobodan Milosevic	Serbia/Yugo: 1989-2000	US\$1bio
6	Jean-Claude Duvalier	Haiti: 1971-1986	US\$300-800mio
7	Alberto Fujimori	Peru: 1990-2000	US\$600mio
8	Pavlo Lazarenko	Ukraine: 1996-1997	US\$114-200mio
9	Arnoldo Aleman	Nicaragua: 1997-2002	US\$100mio
10	Joseph Estrada	Philippines: 1998-2001	US\$78-80mio

Source: Transparency International 2004²⁷

Whilst these PEPs fall into the category generally known as kleptocrats, corruption risks are not the only risks presented by PEPs. These PEPs were likely also involved in murder, kidnap and human rights abuses alongside. PEPs like General Augusto Pinochet of Chile may have been involved in drug trafficking and other organised criminal activities either directly, for example in the case of General Manuel Noriega in Panama, or indirectly in the case of Raúl Salinas, the brother of then President Carlos Salinas of Mexico. PEPs may also be involved in financing terrorism, which would certainly include Colonel Muammar Gaddafi of Libya, and Weapons of Mass Destruction Proliferation, for example at least at some stage by President Saddam Hussein of Iraq and Kim Jung Il of North Korea who also pursued currency counterfeiting as a means of generating illegal profits.

Nevertheless it is in the area of corruption that senior public officials are most exposed and on occasions some will become corrupt and then some will engage in grand corruption on a massive scale. Whilst corrupt PEPs are probably a small portion of the entire population of PEPs, a single corrupt PEP can have a significant impact on a country and on a region.

The ways in which corrupt PEPs laundered their corrupt monies have a classic and familiar feel. Corrupt heads of state and prominent public officials would open bank accounts in their own names in foreign offshore centres or use relatives to open and operate bank accounts. They may well open numerous accounts at different banks in different centres to both diversify their risks and also to ensure no one but themselves could appreciate the true picture of the total wealth accumulated. The classic case is likely no longer as viable as foreign governments once supportive of corrupt regimes as a bulwark against the spread of an alternative political philosophy or regional instability, even financing them indirectly through commodity business, inward investment and aid, have adopted a more critical stance, law enforcement and regulators have become serious about compliance with new improved standards and banks have largely stepped up their approach when dealing with PEPs. Also the emergence of NGOs like Transparency International, Basel Institute of Governance and Global Witness seek to ensure civil society hold stakeholders to account.

More recent techniques show that PEPs continue to include the use and abuse of bank facilities but this is done by using close associates as fronts or cover for the PEP and/or by the use of intermediaries, and/or gatekeepers to establish complex and opaque corporate structures in order to hide the involvement or interest of the PEP. PEPs will also in addition to retaining some assets in bank accounts, diversify into holding

physical cash or negotiable securities, acquiring physical property, for example real estate, precious metals and stones, and high value goods, such as art, cars, planes and boats.

Whilst the conversion of corrupt monies into assets may assist a PEP in avoiding holding large sums in bank accounts where such assets are under greater scrutiny, such assets may not avoid the glare of publicity which the corrupt PEP will want to avoid.

Whilst close associates certainly continue to benefit from ties to corrupt PEPs more modern techniques will not have the close associate holding assets as a strawman for a corrupt PEP but the close associate will instead benefit through contracts and concessions awarded and allowed to prosper by the PEP who then builds a successful business and either provides every comfort to the PEP during his tenure or provides for his retirement after he leaves office.

A variation on this, and it must be said in this case there is no suggestion of illegality, perhaps however illustrates the point in the modern context of how even in the heart of Europe, PEPs may be perceived as benefiting from their public office and how the challenges for identifying PEPs misuse of power for private gain may develop. Gerhard Schröder was German Chancellor from 1998 until 2005 and was a strong advocate of the Nord Stream pipeline project, which aimed to supply Russian gas directly to Germany, bypassing transit countries, who would have been able to charge for the privilege and would have provided them some influence over the Russians. Nevertheless, the agreement to build the pipeline was signed two weeks before the German elections, just a few weeks before Schröder stepped down as Chancellor. Soon after stepping down as chancellor, Schröder accepted Gazprom's nomination for the lucrative post of the head of the shareholders' committee of Nord Stream AG. German opposition parties expressed concern over the issue, as did the governments of countries over whose territory gas was already being pumped. In January 2009, Schröder also agreed to join the board of the oil company TNK-BP, a joint venture between oil major BP and Russian partners. Gerhard Schröder was not the first and many more PEPs have benefited handsomely from their time in office after stepping down, many like Schröder no doubt legally, others not so.

Chancellor Schröder is not the only PEP to find substantial rewards awaiting him after he leaves office, though the trend appears to be a noticeable one.

Sovereign Wealth Funds

Given the sums of monies managed and/or at the disposal of Sovereign Wealth Funds (SWF), the opportunity for corruption and bribery is high. Such is the perceived risk that in 2008 the Chief of the Fraud Section at the US Department of Justice, Steve Tyrell, said the "recent boom of sovereign wealth funds is an area at the top of the Justice Department's hit list". In 2011 a reported inquiry into certain Financial Institutions dealings with sovereign wealth funds, was announced. While no allegations of any wrong doing was reported, the SEC nonetheless requested information from a targeted group of US based financial institutions. The probe was essentially into possible violations of the primary US anti-corruption legislation, Foreign Corrupt Practices Act ("FCPA"), in connection with investments made by Sovereign Wealth Funds just before or during the global financial crisis of 2008. See Part 2, Section 8, Outlook Cases below.

No	Top 20 Sovereign Wealth Funds	Assets US\$bio
1	UAE-Abu Dhabi Inv Authority	627
2	Norway Gov Pension Fund - Global	593
3	China SAFE Investment Co	567.9**
4	Saudi Arabia SAMA Foreign Hldgs	532.8
5	China Investment Corp	482
6	Kuwait Investment Authority	296
7	China-HK MA Investment Portfolio	293.30
8	Singapore Investment Corp	247.5
9	Singapore Temasek Holdings	157.5
10	Russia National Welfare Fund	149.7*
11	China National Social Security Fund	134.5
12	Qatar Investment Authority	100
13	Australian Future Fund	80
14	UAE-Dubai Investment	70
15	UAE-Abu Dhabi Inter Pet Inv Co	65.3
16	Libyan Investment Authority	65
17	Kazakhstan National Fund	58.2
18	Algeria Revenue Regulation Fund	56.7
19	UAE-Abu Dhabi Mubadala Development Co	48.2
20	South Korean Inv Corp	43

Source: <http://www.swfinstitute.org/fund-rankings/>

*This includes the oil stabilization fund of Russia.

**This number is a best guess estimation.

The finances available to these funds make them an attractive source of revenues for many institutions such as asset managers, investment banks, and custodians to name a few. This potential revenue may encourage misguided professionals and those who are prepared to engage in unethical business practices to target SWFs. The risks that apply to SWFs may also equally apply to other government funds and assets.

SWFs are increasingly playing an important role in the global economy and the international financial system. Assets under management of SWFs are currently estimated to total US\$2-3 trillion, exceeding assets managed by hedge funds (US\$2.3 trillion). These funds' assets are projected to surpass global foreign exchange reserves and are forecasted to exceed US\$7-11 trillion by beyond 2013.

Generally SWFs fall into two categories: commodities funds, financed by commodity exports (such as oil) and non-commodity funds, which are usually financed by excess of foreign current reserves.

The International Monetary Fund highlights that typically SWFs can be categorised as stabilisation funds, savings funds, pension reserve funds, or reserve investment corporations. The majority of these funds are savings funds for future generations or fiscal stabilisation funds. Examples of reserve investment corporations include for example, China Investment Corporation (CIC), Korea Investment Corporation (KIC), and Government Investment Corporation of Singapore (GIC). The top 20 Sovereign Wealth Funds as compiled by the SWF institute 2008 are listed above:

Public finance management is always susceptible to abuse and SWFs are no exception, though most are generally well run and should be of little concern. Still, the funds have different legal structures, governance and levels of transparency, which are often reflective of the economic and regulatory development of the state itself.

Precious Metals & Stones Dealers

"A diamond is forever"
De Beers Marketing

Introduction

These precious stones alongside others and precious metals, whilst highly sought after by many for legitimate reasons are attractive to criminals in many ways. Historically, precious metals were important as a currency but are now regarded mainly as an investment and as industrial commodities.

In addition to their long association with money, precious metals and stones have a similarly long association with crime due to their equivalency to money and the fact that they are easily transportable, concentrated forms of wealth that can be exchanged for cash anywhere in the world. In addition, precious metals, especially gold, silver, and platinum, have a ready, actively traded market, and can be melted and poured into various forms, thereby erasing refinery marks while precious stones have usually no markings especially rough stones leaving them untraceable. For these reasons, precious metals and stones are highly attractive to money launderers and other criminals, including those involved in the financing of terrorism.

Dealers in these precious products and financial institutions that conduct business relationships with dealers should be wary of the potential involvement in criminal activity for the purpose of money laundering or terrorist financing.

Dealers could include a wide range of persons, from those who produce precious metals or precious stones at mining operations, to intermediate buyers and brokers, to precious stone cutters and polishers and precious metal refiners, to jewellery manufacturers who use precious metals and precious stones, to retail sellers to the public, to buyers and sellers in the secondary and scrap markets. Still those that only manufacture jewellery or are only involved in mining, cutting or polishing may be excluded from the dealer definition.

Definition/Description

FATF have identified a class of businesses they call, "Designated Non-Financial Professions and Businesses (DNFPBs)" being professions and businesses that are seen as being attractive to money launderers and these are: casinos, (when their customers engage in financial transactions above US\$/€3,000), lawyers, accountants

and trust and company service providers, dealers in precious metals and stones (when their customers engage in cash transactions above US\$/€15,000) and real estate agents. As far as precious metals and stones are concerned, the regulations typically exclude businesses where the purchases or sales are carried out for, connected with, or for the purpose of manufacturing jewellery or extracting precious metals from a mine.

A precious metal is a rare, naturally occurring metallic chemical element of high economic value. The status of a "precious" metal can also be determined by high demand or market value. Precious metals in bulk form are known as bullion and are traded on commodity markets. Bullion metals may be cast into ingots or minted into coins. The defining attribute of bullion is that it is valued by its mass and purity rather than by face value as in the case of money. Chemically, the precious metals are less reactive than most elements and have a shiny surface. Gold, silver, platinum, and palladium are considered the four principal precious metals.

Whilst gold and silver were used extensively in coinage, art and jewellery, platinum has only relatively recently acquired both its place in jewellery and investment portfolios, since being discovered during the Spanish conquest of the New World. Palladium is mostly used in catalytic converters, which convert harmful gases from car exhausts into less-harmful substances, and is also used in electronics, dentistry, medicine, hydrogen purification, chemical applications, and groundwater treatment. Palladium plays a key role in the technology used for fuel cells, which combine hydrogen and oxygen to produce electricity, heat, and water.

The demand for precious metals is driven not only by their practical use but also by their role as investments and a store of value. Historically, precious metals have commanded much higher prices than common industrial metals.

Gold and silver, and sometimes other precious metals, are often seen as hedges against both inflation and economic downturn. Silver coins have become popular with collectors due to their relative affordability, and, unlike most gold and platinum issues which are valued based upon the markets, silver issues are more often valued as collectables, far higher than their actual bullion value.

Money Laundering/ Terrorist Financing Risks

Precious Stones are today considered to include only four, namely the diamond, ruby, sapphire and emerald

which traditionally command a premium price in the market due to their extraordinary colour or brilliance and extreme rarity. Historically speaking other stones were considered as "precious", though now they are more properly considered "semi-precious" and include, pearl, though not strictly speaking a gemstone, opal and amethyst. Other less well known and rarer so called "semi-precious" stones such as alexandrite, demantoid garnet, tsavorite garnet and tanzanite can be just as expensive as a ruby or sapphire. Very fine tourmaline, spinel and aquamarine in larger sizes also command very high prices in the market, so the difference between precious and semi precious may need to be revised.

Of all the precious stones, diamond is the most popular and generally the most expensive, but interestingly is no longer particularly rare. After the discovery of huge South African diamond finds in 1870, diamonds could be mined by the ton. There was such a glut of supply and so little demand that the British financiers of the South African mines were in danger of losing their investment. Their solution was to create the powerful De Beers cartel that to this day controls worldwide diamond production and supply. Quality diamonds are actually not scarce at all. But De Beers controls how much supply comes on to the market and that keeps prices high. The De Beers consortium also mounted a concerted decades-long advertising campaign to associate diamonds with love, courtship and marriage, under the now familiar slogan "A diamond is forever".

The diamond engagement ring, once unknown in most parts of the world (including Europe), is now considered an essential part of the ritual of marriage. It is hard to avoid the conclusion that diamond's special position as a precious stone is due largely to monopoly economics, and clever marketing.

Precious stones, jewels and precious metals have unique physical and commercial properties which carry value in small, easily transportable quantities and are forms of wealth that can be exchanged for cash anywhere in the world.

Some of the most exquisite come in the form of jewellery and command great prices too. The most expensive jewellery include, tiaras to rings, being purchased at auction with the most expensive, a pink round-cornered rectangular diamond purchased by famed jeweler Laurence Graff for US\$46.2mio. The diamond was formerly owned by jeweller Harry Winston. This beauty set the record for most expensive single jewel ever sold at auction. Laurence Graff renamed it "The Graff Pink."

Top 5 precious stone jewels sold at auction		
1	The Graff Pink	US\$46.2mio
2	The Wittelsbach-Graff Diamond	US\$24.3mio
3	The Perfect Pink	US\$23.2mio
4	Bulgari two-stone coloured Diamond & Diamond Ring	US\$15.7mio
5	Wallis Simpson's Panther Bracelet	US\$12.4mio

Source: Author

In addition, precious metals, especially gold, silver, and platinum have a ready, actively traded market, and can be melted and poured into various forms, thereby erasing refinery marks and leaving them untraceable.

Gold, for example, is a major precious metal commodity that poses risk for the following reasons: it has a high intrinsic value that can be authenticated; it is not subject to issuer risk, and; it is easily convertible (exchangeable), can be transported and fabricated. Gold is sourced from the ground by mining companies who produce approximately 65% of the annual total with recycled gold contributing to the rest of the annual supply. The recycling of gold ensures there is a potential source of readily available supply when needed. This helps to cater for an increase in demand and keep the gold price stable. On the demand side jewellery production accounts for almost half with bar and coin demand slightly behind.

Gold production and reserves by Country (2007)		
1	China	11.3%
2	South Africa	11%
3	Australia	11%
4	US	10%
5	Peru	7%
6	Russia	7%
7	Indonesia	6%
8	Canada	4%
9	Others	34%

Source: Minerals Resources Programme of the US Geological Survey (Mineral Commodities Summary, 2010)

The other precious metals; silver, palladium, and platinum do not exhibit the same high risks as gold. For

example, using July 2010 prices, silver which is priced at US\$588/kg, compared to platinum at US\$87,741/kg and gold at US\$24,317/kg, is hardly a precious metal at all and has low consumption levels. Silver and palladium (US\$13,632/kg) are also hardly used in the jewellery business, but more in industry which is substantially less prone to money laundering risks.

Digital Precious Metals

Digital precious metals, a relatively new way of transferring value online, enable users to secure cash deposits against precious metals held offshore. A recent report published by US National Drug Intelligence Centre (US NDIC) observed that digital gold currencies are the most popular type of digital currency. According to the Global Digital Currency Association (GDCA), digital currency transactions account for billions of dollars each year. Digital gold currency transactions alone increased from approximately US\$3bio in 2004 to approximately US\$10bio in 2006. For details on e-gold, an electronic currency reportedly backed by gold bullion see Part 2, Section 7, Criminal Cases, [Douglas Jackson](#). Individuals establish online accounts by providing their names, e-mail addresses and physical addresses which can be easily fabricated and a valid e-mail address. Some digital precious metals also allow users to establish anonymous accounts. Once the accounts are established, individuals can then trade their virtual holdings of precious metals with account holders (or with other accounts held by the same beneficial owner in the case of money laundering). US NDIC also noted that in some digital currency services, anonymity continues during the digital currency account funding process. Individuals can fund digital currency accounts by making cash deposits directly to an exchanger's bank account. The seller transfers ownership of the virtual precious metal holdings to the purchaser at the completion of a transaction. The proceeds can be received through a variety of traditional and non-traditional payment methods. Digital precious metals may also be used to purchase goods and services at participating merchants or be redeemed into physical gold.

A case where digital precious metals such as e-gold were abused involved the arrest of the members of the organised cybercriminal group, Shadowcrew. In October 2004, the US Secret Service closed an illegal online website that trafficked in at least 1.5 million stolen credit and bank card numbers that resulted in losses in excess of US\$4mio. It was alleged that payments for illicit merchandise and services was paid for and received by Shadowcrew members using systems including e-gold and Web Money. Six Shadowcrew members were eventually charged with conspiracy to commit credit

and bank card fraud, as well as identification document fraud. One of the six defendants was also charged with the unlawful transfer of identification documents to facilitate criminal conduct. Several others were indicted on conspiracy charges. In June 2006, the alleged ringleader was sentenced to 32 months imprisonment.

More recently interest and concern has risen regarding "Bitcoin" which is now 5 years old and has become the flagship of digital currencies, though heads a long list including: Copperlark, Feathercoin, Litecoin, Megacoin, Mincoin, Namecoin, Novacoin, Peercoin, Phenixcoin, Primecoin, Protoshares, Quarkcoin, Terracoin and Worldcoin.²⁸

"Conflict Diamonds" or "Blood Diamonds"

A major concern has arisen which deserves particular mention, namely Conflict or Blood Diamonds.

Conflict diamonds or also known as blood diamonds are diamonds that are used to fuel violent conflict and human rights abuses. They have funded brutal wars in Africa, in particular in Angola, Liberia, Sierra Leone, Democratic Republic of Congo and the Ivory Coast that have resulted in the death and displacement of millions of people. Diamonds have also been used by terrorist groups such as [Al-Qaeda](#) to finance their activities and for money laundering purposes.

Reports estimated that as much as 20% of the total diamond production in the 1980s was being sold for illegal purposes and 19% was specifically conflict in nature. By 1999, the illegal diamond trade was estimated by the World Diamond Council to have been reduced to 3.06% of the world's diamond production. The World Diamond Council reported that by 2004 this percentage had fallen to approximately 1%.

Angola

During the decades long (1974–2001) Angolan Civil War, the [National Union for the Total Independence of Angola \(UNITA\)](#), financed its war with the Government by selling Angolan diamonds, valued at up to US\$3.7bio over the period.²⁹

The UN recognised the role that diamonds played in funding the [UNITA](#) rebels and in 1998 passed UN Security Council Resolutions 1173 and 1176, banning the purchase of conflict diamonds from Angola. Despite the UN Resolution, [UNITA](#) was able to continue to sell or barter some diamonds in order to finance its war effort. As a result a global initiative was undertaken that culminated in the Kimberley Process Certification Scheme (see below for details).

Liberia and Sierra Leone

From 1989 to 2003, Liberia was engaged in a civil war. In 2000, the UN accused Liberian President Charles Taylor of supporting the [Revolutionary United Front \(RUF\)](#) insurgency in neighbouring Sierra Leone with weapons and training. To finance the weapons purchases and support, the [RUF](#) provided Charles Taylor with Sierra Leone diamonds.

In 2001, the UN applied sanctions on this conflict diamond trade, which has since been lifted. In August 2003, Charles Taylor stepped down as President and, after being exiled to Nigeria, was extradited and faced trial in The Hague, being found guilty in 2012 of crimes against humanity and war crimes, he is now serving a 50 year sentence in a high security prison in the UK.

It has also been reported that around the time of the [1998 US Embassy bombings in East Africa](#), [Al-Qaeda](#) bought diamonds from the [RUF](#) in Liberia, converting their cash assets into diamonds.

Ivory Coast

Following a coup in 1999 and resulting Civil War, diamonds from Liberia and from Sierra Leone in addition to locally mined diamonds were trafficked through the country and funds derived from this trade used to support those involved in the Civil War. To curtail the illegal trade, the Government stopped all diamond mining and the UN Security Council banned all exports of diamonds from Côte d'Ivoire in December 2005. Despite UN sanctions, however, the illicit diamond trade still exists in Côte d'Ivoire. Rough diamonds are exported out of the country to neighboring states and then on to international trading centres, through the northern controlled section of the country where rebel forces are reported to be using these funds to re-arm.

Democratic Republic of the Congo

The Democratic Republic of the Congo (DRC and formerly Zaire) has suffered numerous civil wars in the 1990s, but now is relatively stable, though the prospect of conflict especially around election time is a recurring risk. The abundant minerals and jewels that can be found in the DRC provided both a basis for past conflict but also the means to forge agreements and establish peace amongst the various groups vying for power in the DRC.

The DRC exports about 8% of the world's diamonds, with one of the most celebrated and priceless diamonds, the "Star", a flawless D-colour 200 carats (40g) being discovered in the DRC and sold during a past civil war in the early 1990s to De Beers.

In addition to diamonds, DRC has also had experiences of the illicit trade in particular valuable minerals, including cassiterite, (the ore for tin), coltan (the ore for a rare metal called tantalum), wolframite (tungsten ore), and gold. The illicit trade provided rebel groups and units of the national army with tens of millions of dollars a year that are then used to finance arms purchases and campaign finance or voter fraud at election time.

Claims that Congolese diamonds are sought and bought by terrorist groups are difficult to prove, but allegations are made.³⁰

The Republic of Congo

The Republic of Congo (Congo-Brazzaville) was up until 2004–2007 exporting large quantities of diamonds, most likely shipped from the DRC and was also accused of falsifying certificates of origin. It has since improved its approach to diamonds and has tried to clean up its image.

Zimbabwe

Zimbabwean diamonds are not officially considered conflict diamonds, but NGOs like Global Witness³¹ claim that exports from companies operating in the controversial "Marange" diamond fields in Zimbabwe are tainted. They claim that the Zimbabwean army effectively seized control of the area in 2008, killing around 200 miners. Mining concessions were then granted in legally questionable circumstances to several companies, some of them associated with senior figures in Robert Mugabe's Zanu PF party. Newspapers have reported that the Zimbabwean Central Intelligence Organisation, the state security service aligned with Mugabe whose members are accused of committing acts of violence against opposition supporters, directly benefits from off-budget diamond revenues. Again according to Global Witness, "Over the last decade, elections in Zimbabwe have been associated with the brutal intimidation of voters. Orchestrating this kind of violence costs a lot of money. As the country approaches another election there is a very high risk of Zanu PF hardliners employing these tactics once more and using Marange diamonds to foot the bill."

Kimberley Process Certification Scheme (KPCS)³²

In 2000, the World Diamond Congress (now World Diamond Council) adopted at Antwerp a resolution to strengthen the diamond industry's ability to block sales of conflict diamonds, and in 2002 the UN approved the results. Whilst initially supported the process is losing support internationally such that it is beginning to be seen as seriously compromised and weakened.

Private Military Firms

"Although some might argue that it is a peculiarly male version of prostitution, it has effectively been around for as long as war has been waged."

by Peter Tickler in 'The Modern Mercenary'

Introduction

Private Military Firms (PMFs) have been in the national and international spotlight in recent years, most famously known are the actions of some in Iraq. There are many mixed feelings about PMFs, some say that they are necessary and that they help countries to save money, but to others, they threaten the role of the state in overseeing its armed forces, by gathering intelligence, supplying forces and building influence they profit from war, pose risks of corruption and may be likely to encourage military action abroad.

Definition/Description

A private military firm (PMF) is a private sector entity that provides services that are intricately linked to warfare. One of the leading researchers on the topic, Peter W. Singer of the Brookings Institution,³³ distinguishes three types of PMFs:

- i) Military Provider Firms (MPF) providing direct tactical, military assistance which may include front-line combat;
- ii) Military Consultant Firms (MCF) providing expert strategic advisory & training services; and
- iii) Military Support Firms (MSF) providing logistics, intelligence and maintenance services.

MPFs frequently provide military-style security, labelling this as defensive or passive work. Yet in this role they can quickly find themselves in a battle that puts them in the role of actual, or perceived, aggressor. An example of an MCF is a subsidiary of a western arms manufacturer, providing training for equipment it sold to another Western state in that same state. Another example is a company providing training to foreign police forces. An example of a MSF is a consultancy analysing satellite imagery for the military, or a company running the canteens for an army base. MCFs and MSFs can work both in peaceful environments, battlefields or in otherwise corrupt or unstable environments.

Money Laundering/Terrorism Financing Risks

The PMF industry has displayed strong growth in the past few years. Even before the Iraq War, it was estimated that the industry had annual market revenue in the range of US\$100bio which would at least double

by 2010. Large contracts are awarded for example by governments for logistics services to their militaries, by the private sector for military-style protection of personnel and facilities, and by international organisations for humanitarian de-mining operations. With the Iraq War, the market exploded. It is estimated that about 181 private firms with around close to 50'000 armed employees carried out military functions in Iraq. The US State Department spent for example US\$500mio in 2008 on PMFs.³⁴

PMFs have made negative headlines, though they have also provided some heroic and valuable services. The risks associated with PMFs are, however, not new as PMFs in many instances have men operating in corrupt and unstable environments. The principals often cannot fully verify whether the billed services correspond to the services actually provided. Many payments are made in cash. The risk of corruption and fraud, and therefore money laundering, is high. As there is so much money to be made, profiteering cannot be ignored and in a war zone, there is little enough good governance, transparency or accountability.

The industry is also controversial because PMFs are rarely sanctioned or fully investigated when allegations of misbehaviour surface. Even if major crimes are done, PMF's may enjoy significant protection. In passing the Coalition Provisional Authority Order 17 of June 2003, for example, the provisional Iraqi Government granted exemption from prosecution to all personnel action on behalf of the coalition including PMF employees. Critics also point to outsourcing military tasks not for effectiveness but to "improve" figures on troop numbers and body counts. Further, there is the risk that states that outsource military functions run the risk of increasing dependency which is financially detrimental and not conducive to the rapid resolution of the conflict situation at hand.

During the Iraq occupation, tens of thousands of PMFs worked alongside the regular military soldier. Perhaps the most well known was Blackwater USA (renamed Xe Services and now Academi) who provided services ranging from feeding the troops to armed combat. According to P. W. Singer, the author of *Corporate Warriors: The Rise of the Privatized Military Industry*,³⁵ their pay ranged from US\$250 a month for Kurdish fighters to US\$1,000 a day for former US Green Berets. One example in Iraq in 2004 highlights the problems. Blackwater employees entered the city of Fallujah, looking apparently for terrorists, but according to others in fact spent their time, carrying out night-time raids, assaulting women and children, and torturing and murdering local men and teenage boys.

Major Private Military Firms		
No	Name	Country
1	G4S	UK
2	Unity Resources	Aus
3	Erinys	US
4	Asia Security Group	Afghanistan
5	DynCorp	US
6	Triple Canopy	US
7	Aegis Defence Services	UK
8	Defion International	Peru
9	Academi (formerly Blackwater / Xe Services)	US

mercenary group for hire that was disbanded in 1998, though retained contacts with Simon Mann who with Tim Spicer ran controversial Sandline International whose successor is Aegis Defence Services and is a British private military company with overseas offices in Afghanistan, Bahrain, Iraq, Kenya, Nepal and the US. Simon Mann was involved in the attempted coup in the Equatorial Guinea seeking to overthrow President Obiang..

The following are some notable private contracts from the past decade with estimates of their costs.

Firstly, Vinnell Corp for supplying and training the Saudi National Guard, the elite forces that protect the Saudi monarchy and maintain stability at an estimated cost of US\$831mio and for training a number of battalions of the Iraqi army at an estimated cost of US\$48mio.

Aegis Defence Services were contracted to provide security for the Programme Management Office monitoring the reconstruction effort in Iraq. The contract called for up to 75 two-man security teams trained in "mobile vehicle warfare" and "counter-sniping," and put Aegis in charge of coordinating all the private security contractors in Iraq at an estimated cost of US\$293mio.

Another case was DynCorp who were contracted to provide a security detail for Afghan President Hamid Karzai at an estimated cost of US\$52mio and contracted to create a new Iraqi police force at a cost of US\$50mio.

Erinys International were contracted to protect Iraq's oil pipeline, requiring 14,500 guards at an estimated cost of US\$39.2mio.

CACI Systems and Titan Corp were contracted to provide interrogation services in Iraq, including working at Abu Ghraib at an estimated cost of US\$19.9mio.

Executive Outcomes were asked to help defend Sierra Leone's capital, repelling an invading rebel army, and storming its stronghold. While under contract Executive Outcomes defeated two violent coup attempts by the rebel army, but a third internal coup did succeed which brought to power a head of state more sympathetic to Executive Outcomes at an estimated cost of US\$35mio.

Finally, Onix International provided a team of former New Zealand special-ops soldiers to rescue a businessman held hostage in East Timor for an estimated US\$20mio.

Real Estate Agents

"Ninety percent of all millionaires become so through owning real estate. More money has been made in real estate than in all industrial investments combined. The wise young man or wage earner of today invests his money in real estate."

Andrew Carnegie – Scottish businessman and philanthropist

Introduction

According to a FATF report titled, "Money Laundering & Terrorist Financing through the Real Estate Sector",³⁶ the use of real estate to launder money seems to afford criminal organisations a triple advantage, as it allows them to introduce illegal funds into the system, while earning additional profits and even obtaining tax advantages (such as rebates, subsidies, etc.). Non-financial professionals such as notaries, registrars, real estate agents etc., are sometimes used by suspected criminals on account of their central role in carrying out real estate transactions. Their professional roles often involve them in a range of tasks that place them in an ideal position to detect signs of money laundering or terrorist financing.

Definition/Description

FATF have identified a class of businesses they call, "Designated Non-Financial Professions and Businesses (DNFPBs)" being professions and businesses that are seen as being attractive to money launderers and these are: casinos, (when their customers engage in financial transactions above US\$/€3,000), lawyers, accountants and trust and company service providers, dealers in precious metals and stones (when their customers engage in cash transactions above US\$/€15,000) and real estate agents. A real estate agent or broker acts as a licensed intermediary between the seller and the buyer of real estate.

Buying property offers criminals an opportunity to integrate their laundered money by making an investment while also giving their criminal enterprise the appearance of financial stability. Buying a hotel, a restaurant or other similar investment offers further advantages, as it brings with it a business activity in which there is extensive use of cash and thus a steady, legitimate source of funds in which to come into and hide dirty money. Real estate is also purchased in order to facilitate further crimes such as trafficking in illegal immigrants in order to staff a recently purchased restaurant or factory or which may produce counterfeit or pirated goods.

With the real estate market being one of the largest markets in the world, prices can vary with some prices reaching very high levels and enticing those seeking luxury as well as status.

The most expensive house in the world is owned by Mukesh Ambani, an Indian billionaire and heir, alongside brother Anil, each to half of the Reliance Group of Companies, following the death of his father. Ambani has a net worth of US\$43bio and decided to build a new skyscraper in the centre of Mumbai, named Antilla for his wife and three children to live in, along with 600 staff. The 27 story (family home) skyscraper reputedly cost US\$2bio has a helipad, a health club, and a six-floor garage that can hold 168 cars. Each level has gardens.

Besides new builds, the most expensive purchase of a private residence was the Villa Leopolda on the Cote d'Azur, in France, for £390mio. The property has 20 acres of gardens, overlooks Cap Ferrat near Villefranche and was originally built as a summer retreat for King Leopold II of Belgium. Its new owner is believed to be one of the Russian oligarchs.

Whilst individual cities and properties have particular attractions, there are a collection of locations that continue and compete as the most expensive locations for real estate. According to UBS, Oslo, followed by Zurich and then Tokyo are the most expensive cities in the world to live while 70 places further down the list are occupied by Bucharest, Mumbai and Delhi. As far as pure real estate prices are concerned Monaco leads London and Hong Kong in the global rankings.

Real Estate Prices	
Country	Price per sq meter
1 Monaco	US\$53,000
2 London	US\$20,500
3 Hong Kong	US\$19,500
4 Paris	US\$18,000
5 Singapore	US\$17,000
6 Geneva	US\$15,500
7 Moscow	US\$14,000
8 Tokyo	US\$14,000
9 New York	US\$13,500
10 Mumbai	US\$13,000

Source: 257.com 2012 (numbers rounded up)

Beyond owned real estate, the most expensive rented accommodation is probably the Royal Penthouse Suite in the Hotel President Wilson in Geneva which costs US\$65,000 per night. This palatial suite, which occupies an entire floor of the hotel and measures 18,083 square feet, has 10 rooms and seven bathrooms. It was renovated in January 2009 to add a new private fitness area, according to a spokesperson.

Money Laundering/Terrorist Financing Risks

Beyond the legitimate high value real estate sector, there is another and as the FATF Report states, "Real estate transactions can be used to cloak illicit sources of funds or serve as legitimate front businesses, particularly if they are cash intensive. Properties may be bought and sold under false names or by shell corporations and can readily serve as collateral in further layering transactions." As a result, real estate agents are in a position to assist in money laundering or help in the fight against it. For that reason, the FATF included the business of buying and selling real estate as covered under Recommendation 5, 22 and 23 as referenced above.

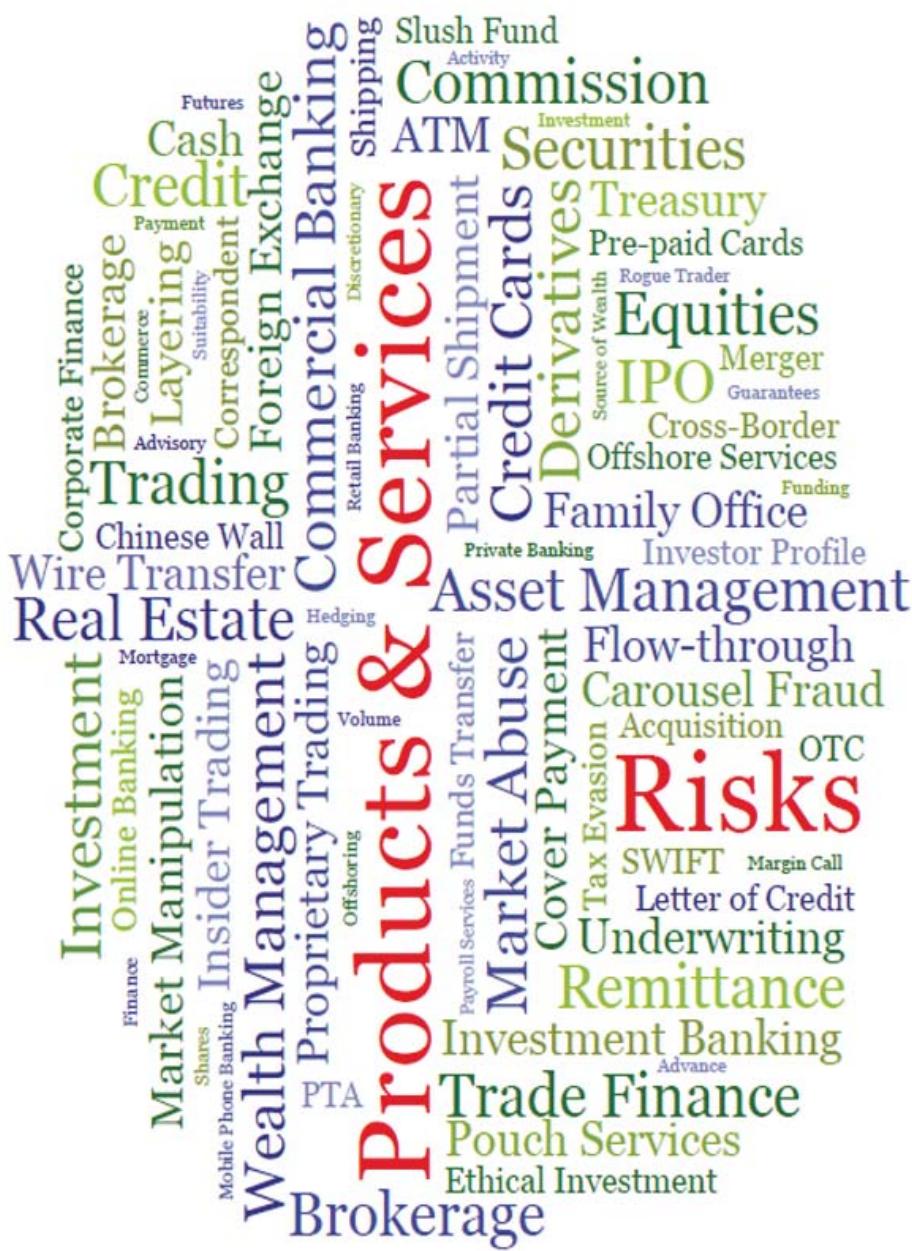

Real estate agents have been used by organised criminal gangs and drug traffickers to launder money by converting criminal proceeds into real estate assets. OFAC referenced the connection back in 1995 when US President Clinton issued an Executive Order to block assets and prohibit transactions with the Colombian drug cartels and launched their "Specially Designated Narcotics Traffickers" or SDNT programme. The SDNT list referred to "527 companies and 815 individuals involved in the ownership or management of the 21 Colombian drug cartel leaders' business empires. The businesses named as SDNTs ranged across industries and included drugstore chains, a supermarket chain, pharmaceutical laboratories, airlines, a medical clinic, hotels, restaurant service companies, radio stations, sports teams, communications companies, construction firms, real estate firms, investment and financial companies, consulting companies, offshore firms, horse breeding farms and other agricultural businesses, mining operations, maritime agencies, and a department store."³⁷

The Yakuza gang prominent in Hawaii, Yamaguchi-Gumi, is heavily into real estate there with significant holdings in several other states as well (California, Oregon and Washington). The Australian Federal Police also report that the Yakuza are laundering the proceeds of their crimes (committed elsewhere) through Australian real estate. Real estate was also connected to Human Traffickers in the 2011 FATF Report "Money Laundering Risks Arising from Trafficking in Human

Beings and Smuggling of Migrants", when the use of cash to invest in real estate was cited. Another risk that should not be overlooked when dealing with real estate agents is indirect sanctions risks.

The FATF report on "RBA Guidance for Real Estate Agents"³⁷ supports the development of a common understanding of what the risk based approach involves and outlines the high-level principles involved in applying the approach as well as best practices in the design and implementation of an effective risk based approach. In addition, the FATF report titled, "Money Laundering & Terrorist Financing through the Real Estate Sector" lists red flag indicators that relate to the real estate agent's customer and components of the transaction to which the financial institution may not be involved.

A few broader red flag indicators include: (i) Transfer of real estate between parties in a time period that is unusually short with no apparent legitimate reason; (ii) Money coming in from abroad related to real estate purchase. Hard to assess property worth especially in other countries where it varies from region to region; (iii) Non-disclosure of underlying client. Real estate agent setting up account to purchase the property, not disclosing actual buyer, money coming from buyer not disclosed; or (iv) Unusually high fees/commissions for real estate transaction that would not ordinarily warrant such a premium.

A Brief History of Banking

Banks have been around since the first currencies were minted, perhaps even before that, in some form or another. Currency, particularly the use of coins, grew out of taxation by rulers and as empires expanded, coins of varying sizes and metals that could be exchanged easily served as a way to pay for foreign goods and services. These coins, however, needed to be kept in a safe place. Ancient homes did not have the benefit of a steel safe, therefore, most wealthy people held accounts at their temples, where priests or temple workers were trusted as both devout and honest, but over time, records from Greece, Rome, Egypt and Ancient Babylon suggest temples also loaned deposited money out, in addition to keeping it safe. The fact that most temples were also the financial centres of their cities, is the major reason that they were ransacked during wars.

The Romans took banking out of the temples and formalised it within distinct buildings and so began the distinct trade where moneylenders profited from taking in and lending money. Julius Caesar, in one of the edicts changing Roman law after his takeover, gives the first example of a major shift in power between lender and landowner allowing moneylenders to confiscate land in lieu of default in loan repayments.

After the fall of Rome, banking was largely abandoned in Western Europe and did not revive until the time of the crusades, in the form of papal and other powerful bankers, that emerged in the Holy Roman Empire. Outside the papal institutions, banking became subject to additional restrictions, as the charging of interest was seen as immoral, equally so on the face of it under Islam and Judaism. Whilst some interpret for example the Jewish Torah as forbidding the charging of interest only by Jews to other Jews and not to non-Jews, or Gentiles, the involvement of Jews in the money lending business is likely much more to do with the fact that by the time of the Middle ages, Jews were ostracised from most professions by local rulers, the Church and the guilds and so were pushed into marginal occupations considered socially inferior, such as tax, rent collecting and money lending.

As commerce expanded, innovation played its part and bills of exchange were created as a means to avoid the carrying of coins and large chests of treasure around. Money changers at merchants fairs issued documents redeemable at other fairs, in exchange for hard currency. These documents could be cashed at another fair

in a different country or at a future fair in the same location. If redeemable at a future date, they would often be discounted by an amount comparable to a rate of interest, or for an equivalent fee, much as today's Hawaladers and the like operate.

With finance available for trade, both local and international, both commerce and those that controlled finance largely prospered. The term moneylenders had already morphed and now those involved became known as bankers, through the term "bank," - banco, banque, bank each meaning, "bench" or "counter" where the moneylender sat usually with some of his money in plain sight in fairs to town squares. When a banker was no longer solvent the bench would be smashed or ruptured and the banker declared, "bankrupt". Amongst bankers, there developed a hierarchical order. At the top were the bankers who did business with heads of state, next were the city exchanges, and at the bottom were the pawn shops or "Lombards". The most advanced bankers in the middle ages were those from Italy seen as the pioneers of modern banking, for example the "Medici" Bankers in Florence, who not only influenced other Italian bankers but also many more in Germany, France, The Netherlands, Switzerland, England, Spain and elsewhere. Whilst some of those at the top of the banking hierarchy did well from dealing with sovereigns, others did not. Some of the royal powers began to take loans to make up for hard times at the royal treasury, often on the king's terms. For example in 1557, Phillip II of Spain borrowed so much to fight war after war, that he caused the world's first national bankruptcy, as well as the second, third and fourth, in rapid succession. This occurred because 40% of the country's gross national product (GNP) was going toward servicing the debt. Spain never recovered and was quickly surpassed in the late 17th century, by its once fierce rivals whose largest centres for commerce also housed the main centres for banking, being the ports of Amsterdam, London, and Hamburg.

Banking at this time, largely consisted of private banking for the wealthy and commercial banking for trade. As far as private banking and then personal banking, innovation in Amsterdam in the 16th Century led to the introduction of charges for customers for depositing their wealth for safekeeping, a practice that soon spread to the UK. Competition led these bankers to offer other services, including paying out money to any person bearing a written order from a depositor to do so. Britain became a major innovator in the banking world. According to the Payments Council, which represents UK banks, half of the 10 oldest continuously operating banks in the world are in the UK. British

banks invented many of the current account features we now take for granted. Pre-printed cheques appeared in the 18th century, together with a clearing system that involved bank clerks meeting at the Five Bells tavern in Lombard Street, to exchange all their cheques in one place and settle the balances in cash.

In 1778, the Royal Bank of Scotland invented the overdraft. The bank allowed William Hog, a merchant, to take £1,000 (the equivalent of £63,664 today) more out of his account than he had in it. In those times, bank accounts were a luxury for the rich, something that didn't change for more than 200 years. Banking expanded beyond the wealthy to cover also the middle classes and specialised with merchant banks, who used national and international connections, political and financial power and the knowledge and practices of markets to prosper, none more than JP Morgan and Company. JP Morgan and Company emerged at the head of the merchant banks during the late 1800s, exerting great influence over American industry, creating for example, US Steel and AT&T and creating great oligopolies across American Industry. JP Morgan also almost single-handedly halted the Panic of 1907 by quickly persuading all the major players on Wall Street to work towards stability and back a recovery, just as a central bank would do today.

Ironically, despite this act of courage and its successful outcome, JP Morgan and those other so called "robber barons," alongside Carnegie and Rockefeller, as beneficiaries of consolidation were so disliked that the US Government established its own Central Bank in 1913, the Federal Reserve, and started to break up first the monopolies and oligopolies and then after the Great Crash of 1929 even broke up JP Morgan & Co.

With the increasing size of newly formed industrial companies, the amounts needed for growth, could no longer be provided by any one bank, so merchant banks managed IPOs and bond offerings, raising money directly from the public in order to generate sufficient funds. With such offerings, the public in the US, Europe and elsewhere, began to take a greater interest in investments, banks became commonplace and most citizens would open bank accounts for retail services, including taking credit and debit cards. Commerce would still require funding for trade, international payments would increase as would domestic payments, savings and investment products would be taken up by individual customers as well as pension funds and insurance companies, requiring asset management services and merchant banking would transition into investment banking as we see it today.

Banking eventually became available to ordinary households, with many in the developed and developing world gaining access to bank accounts, with it becoming increasingly difficult to function without one. Charge cards were invented in the US in the 1950s quickly followed by credit cards; (for more details see Credit and Other Cards below) and the ATM (see for more details Retail Banking below) deployed by Barclays Bank in London in 1967. Traditionally, bank customers managed their money using a passbook that they took into their branch every time they wanted to pay in money or take it out. However, most bank customers do not need to go into a branch on a regular basis as they can do most of their banking either online, on the telephone or by using a cash machine. As well as in-branch queuing, personal attention from the bank manager has largely become a thing of the past. Most queries on a bank account are now managed by call centres or branch staff who have little or no information on individual clients other than that held on a computer.

Banks have come a long way from the temples of the ancient world, but their basic business practices have not changed. Banks take in peoples money, keep it safe, but at the same time invest it and make those monies grow in value, by numerous means, including providing services such as credit to people who need it, but demand interest as a fee for this service, or providing advice or other services, such as converting or exchanging money or transferring monies.

Although history shows the continued development and innovation within banking, much remains inherently the same. Even if the future takes banks completely off the high street and onto the internet, or more likely via the mobile phone, Banks will remain at the heart of most people's financial experiences for a long time to come. In the sections that follow, there is a brief summary for each of the main types of banking businesses that proliferate today, together with an explanation of the main inherent money laundering and terrorist financing risks that they face. The areas of banking covered are: asset management; brokerage/securities; commercial banking; correspondent banking; credit and other cards; investment banking; retail banking; and wealth management/private banking. The Worlds largest banks by assets can be found in Part 1 Section 2 Sub-Section 2 Customer Risks; Banks and Other Financial Institutions. Whilst some Banks specialise in one of these areas, others more than one, still others considered so called universal banks cover all areas of banking. Few banks are the same, though and each should ideally consider the risks for themselves.

Asset Management

"Don't put all your eggs in one basket"

Well known proverb

Introduction

There is nothing certain in life perhaps with the exception of death and taxes, and the same goes for investments. Whilst investments generally may grow in a bull market, (especially when leveraged), lose value in a bear market (especially when leveraged), increase in value the longer they are invested (lose value the more transactions are undertaken; often due to transaction fees); reduce downside risk by asset class by applying principles of diversification, reduce sovereign and country risk by applying the principles of global diversification; benefit by individual expert stock picking (and fortune) or are harmed by cack-handed opportunists (and bad luck), what remains is a huge amount of investment capital, the oxygen of capitalism running through the veins of the global economy, giving life to some, nourishing many, reaping the benefits from those that flourish and extracting the last breath from those that are no longer considered sustainable.

Despite these investment let alone home truths, the search for a simple positive return and more than this, relative positive return (known as alpha) or predictable risk adjusted returns (known as beta) remains the holy grail for consistent professional asset managers.

Definition/Description

Asset managers, aggregate funds into a significant amount and invest these funds on the basis of representations and promises, looking to meet or beat these representations and promises. Asset managers can be both discretionary and advisory, they can track an index, or invest in a sector, country, region, principle or idea. Where once the industry told the investor what to commit funds to, today the industry caters for individual tastes and styles and competes within each and for individual and professional investors. Leading asset management companies will usually offer a wide range of investment products and services. Typical offerings include i) Equities: core global, regional, country and emerging markets; opportunity, high alpha; small cap, sector, thematic, sustainable; growth style, global US, emerging markets; long/ short, unconstrained, market neutral rules based, high dividend; indexed ETFs; multi-strategy; ii) Fixed Income: global; country and regional; money market; short duration; core and core plus; sector specific; emerging markets; high yield; indexed, ETFs; unconstrained; customised solutions; iii) Global

Investment Solutions: global; country and regional; asset allocation; currency management; return and risk targeted; structured portfolios; risk management; advisory services; multi manager. iv) Fund services: fund/product set-up; NAV calculation; middle office services; reporting; investor services; private labelling; international distribution support; ancillary services for fund of hedge funds. v) Alternative and Quantitative Investments: single manager hedge funds; multi- manager hedge funds; advisory services; quantitative; active Commodities multi-manager; vi) Global Real Estate: vii) Infrastructure and Private Equity.

Total assets under management managers totalled US\$35 trillion at end-June 2013 according to EFAMA, Investment Fund Industry Fact Sheet.

Top 10 / 500 World's Largest Asset Managers (US\$ trillion)			
No	Manager	Home	Assets
1	Blackrock	US	3.5
2	Allianz	Ger	2.1
3	State Street	US	1.9

Money Laundering/Terrorist Financing Risks

Asset management is considered generally lower to moderate risk, particularly in typical situations, for example, for customers, including from domestic pension funds including from publicly owned companies and listed companies; well respected banks such as private banks investing both mass retail and private banking customer's funds; insurance companies investing premiums; and direct individual investors, both high net worth, and mass retail making up and aggregating into collective investment funds. In most cases, all money and other assets within the portfolio are held under the control of a regulated custodian, with money paid to or from the customer through their own bank account. Asset management is not a mechanism for the movement of assets from one person to another, although some third party payments may be made, hence for all these reasons.

Asset management is considered generally to present **low to moderate** inherent AML risks for money laundering purposes. Low risk doesn't mean risk free and asset management is potentially vulnerable to and/or could be abused in a number of ways. Here are the top inherent ML related risks facing an asset manager:

Top ML Risks for an Asset Manager	
1	Sensitive customers
2	Customers with material sensitive country risk exposures
3	Politically Exposed Persons
4	Charities or other not for profit organisations
5	Sanctioned or other problematic customers
6	Fraud
7	Employee/market abuse

Source: Author

1. Sensitive Customers

Customers that could be involved in activity that is itself considered sensitive or controversial, for example, agreeing to manage funds from businesses such as; arms dealer companies or private military firms; businesses that make and/or distribute war materials, in particular controversial weapons (nuclear, chemical or biological or cluster munitions and anti-personnel mines) or dual use goods, businesses involved in mining and minerals, particularly if involved in so called, mountain top removal, forestry or logging businesses, particularly if involved in palm oil extraction or leading to deforestation; businesses with poor human rights records or a record of environmental damage; businesses involved in waste management, infrastructure and real estate funds.

2. Customers with Material Sensitive Country Risk Exposures

Customers, in particular sensitive customers, that are based in or have material exposures to countries that have been identified as posing increased risks, for example countries the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. This also for customers owned or controlled by or dealing with sovereign governments and publicly owned entities from such countries, including sovereign wealth funds and municipalities, also funding for large infrastructure projects. For more details see Part 1, Section 1, Bribery & Corruption; Terrorism Finance & WMD Proliferation Finance and Part 1, Section 3, Sanctions & Embargoes.

3. Politically Exposed Persons

Customers whose funds could be for the benefit of, ultimately controlled by or directed by Politically Exposed Person's where such persons could be considered corrupt or similarly involved in criminal activity; that is, the personal pension fund of a kleptocrat. For more details see Part 1, Section 1, Bribery and Corruption and Part 1, Section 2; Politically Exposed Persons.

4. Charities or other Not for Profit Organisations

Charities or other Not for Profit Organisations, which could be either effectively or insufficiently unsupervised that raise, store, move and/or use money for charitable and other humanitarian causes that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as connected and/or involved in terrorism finance. Organisations providing humanitarian or other similar relief have been used and abused in particular as fronts for Islamic terrorism financing. For more details see Part 1, Section 2, Charities and Not For Profit Organisations:

5. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation etc. Asset managers must be wary in particular to screen customers, for example, against known terrorists and major criminals against lists of persons made available prior to conducting business and against payment flows if to other parties. Also relevant are concerns over securities affected by sanctions. For more details see Part 1, Section 3, Sanctions & Embargoes.

6. Fraud

Investment opportunities that may look too good to be true or have increased fraud risks may not be true. For more details see Part 1, Section 1, Fraud.

7. Employee/Market Abuse

Asset Managers especially large ones, with large orders may find that some of their money laundering risks are actually quite close to home. These include insider dealing for star asset managers, front and parallel trading for others and/or market timing/late trading and other abuses of the market. For more details see Part 1, Section 1, Insider Trading and Market Manipulation.

Brokerage / Securities

"And there is no such thing as a no sale call. A sale is made on every call you make. Either you sell the client some stock or he sells you a reason he can't. Either way a sale is made, the only question is who is gonna close? You or him? Now be relentless, that's it, I'm done."

Jim Young in the movie "Boiler Room"

Introduction

The brokerage/securities industry is one of the core industries, along with banking and insurance, through which persons and entities can access the financial system. The industry is known for its speed in executing transactions, its global reach, and its adaptability; all features that make it attractive to money launderers and terrorist financiers. Additionally, the securities industry is in a unique position to be used to both launder illicit funds obtained outside the sector, and to generate illicit funds within the industry itself through fraudulent activities such as insider trading, market manipulation and (securities) fraud, all "Designated categories of offences" in the FATF 40 Recommendations.

Definition/Description

A brokerage firm is a financial institution that facilitates the buying and selling of financial securities between a buyer and seller; the broker gets a fee or commission when the deal is executed. The term "Security" or "Securities" is not defined in the Glossary of the FATF 40 Recommendations; probably because countries differ in the types of products that they define as Securities. Investopedia defines security as "a financial instrument that represents: an ownership position in a publicly-traded corporation (stock), a creditor relationship with governmental body or a corporation (bond), or rights to ownership as represented by an option. A security is a fungible, negotiable financial instrument that represents some type of financial value."³³ Depending on the jurisdiction, trading in securities is often not limited to securities broker-dealers, but can also involve the banking and insurance industries.

In the US, brokerages are sometimes called "wirehouses" but can also be part of banks, private banks, investment advisers and can operate as discount or online brokers. With increasing consolidation of the main players in the US brokerage business into banks some call these "bankerage". Some unregulated and illicit operations have tried to defraud investors through the operation of so-called "Boiler Rooms". For details see Part 1, Section 1, Market Manipulation.

Top US Brokerages			
No	Name	Advisers	Assets trillion
1	BofA Merrill Lynch	15,000	US\$1.58
2	Morgan Stanley	18,000	US\$1.67
3	Wells Fargo Advisers	15,000	US\$1.2
4	UBS	6,800	US\$0.806

Source: Author

Whilst many investors with significant sums of money will choose to invest via one of the leading brokerages and/or via a typical broker that offers face to face and/or one to one communication, others who value cost and market access over communication and advice may prefer online brokers, and are known as self directed investors. These online brokers can be found all over the world, with the largest concentration being in the US and with services such as a stock trading service you can buy and sell stocks, options, mutual funds, exchange-traded funds and various fixed-income securities including bonds and CDs. Many online stock market investing services offer investment options such as retirement and investment funds for education or retirement and online stock market trading services also offer useful tools such as alerts, watch lists, third-party analyst reports, option chains, investment calculators and virtual trading.

According to TopTenREVIEWS the following, are the top 10 online brokers in the US, evaluated using a number of commercial factors (<http://online-stock-trading-review.toptenreviews.com/>).

Top 10 US Online Brokers	
1	OptionsXpress
2	OptionsHouse
3	TradeKing
4	Scottrade
5	Fidelity
6	E*Trade Financial
7	Charles Schwab
8	TD Ameritrade
9	ShareBuilder
10	Firstrade

Money Laundering/Terrorist Financing Risks

Money laundering risks with securities or brokerage activity takes place since broker-dealers generally do not accept cash, in the layering and integration stages. According to the 2009 FATF Report "Money Laundering and Terrorist Financing in the Securities Sector"³⁴ typical securities related laundering schemes often involve a series of transactions that do not match the investor's profile and do not appear designed to provide a return on investment. Since a key to laundering illicit proceeds is the ability to change them from their original form and ownership by layering transactions, transferable securities should not be overlooked for this process. Now that broker/dealers and other financial institutions that handle securities have more robust AML transaction monitoring programmes, the laundering techniques have become more complex and involve trading and transferring of securities, and the commissions or fees paid are just considered the cost of laundering the illicit funds. In fact, in some cases such as pump and dump schemes or insider trading, the proceeds from the trading itself are the illicit funds that need to be laundered.

Brokerages can generally be considered as presenting **moderate to high** inherent AML risks, however brokerage is still potentially vulnerable to and/or could be abused in a number of ways.

Here are the top inherent AML related risks facing a securities broker.

Top ML Risks in Brokerage	
1	Customers with cash businesses
2	Customers with sensitive businesses
3	Customers with material sensitive country risk exposures
4	Complex or complicated non transparent customers
5	Politically Exposed Persons
6	Sanctioned or other problematic customers
7	Fraud, including market abuse
8	Tax evasion
9	Employees
10	Customers with physical or bearer securities

Source: Author

1. Customers with Cash Businesses

Customers that have businesses that deal in cash in large amounts, high value and/or with a large number

of transactions are highly vulnerable to being used by money launderers as a vehicle to convert and launder the proceeds of crime. There are few high value and/or retail businesses that could not be used though a few are considered particularly vulnerable and these include; high value goods dealers, for example; real estate agents; art dealers including (auctioneers); precious metals and stones dealers (including jewellers); car, plane and yacht dealers; watch dealers, equine or other high bred animals; and cash intensive businesses including; retail outlets such as garages, restaurants, ice cream parlours, clubs (including strip bars) and bars, golf clubs, bowling alleys, private ATM companies, sauna and massage parlours and of course laundromats. Customers owning such businesses may further wish to launder or to invest criminal proceeds. There are some businesses that could fall into both categories and these include; money service businesses, both regulated and unregulated; jewellers; auctioneers and casinos. For more details on some of these businesses see Part 2, Section 2, Sub-section 2, Cash-Intensive Businesses, High Value Goods Dealers, Real Estate Agents and Precious Metals & Stones Dealers.

2. Customers with Sensitive Businesses

Customers involved in arms dealing or in private military firms; customers involved in making and/or distributing war materials or dual use goods may present additional risks. Customers involved in mining and minerals, particularly if involved in so called, mountain top removal, forestry or logging businesses, particularly if involved in palm oil extraction leading to deforestation; businesses with poor human rights records or a record of environmental damage; Customers involved in waste management and scrap metal dealers and businesses that have been identified as posing increased corruption risks themselves, particularly when combined with increased country risks, including with intermediaries as set out in 3. below. For more details see Part 1, Section 2, Sub-section 1, Money Laundering Risks.

3. Customers with Material Sensitive Country Risk Exposures

Customers, in particular sensitive customers, that are based in or have material exposures to countries that have been identified as posing increased risks, for example countries the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. For more details see Part 1, Section 1, Bribery & Corruption; Terrorism Finance & WMD Proliferation Finance and Part 1, Section 3, Sanctions & Embargoes.

4. Complex or Complicated Non-Transparent Customers

Customers, who are unduly or excessively complex, where identification and/or due diligence is difficult to establish or carry out satisfactorily, for example, customers operating through personal investment companies or numerous layers of holding vehicles which appear designed to hide the ultimate beneficial owner. For more details see Gatekeepers in Part 1, Section 2, Sub-section 2.

5. Politically Exposed Persons

Customers who are Politically Exposed Persons including Sovereign Wealth Funds. For more details see Part 1, Section 1, Bribery and Corruption and Part 1, Section 2, Sub-section 2, Politically Exposed Persons.

6. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation etc. Brokerages must be wary in particular to screen customers, for example against known terrorists and major criminals against lists of persons made available prior to opening of accounts and against payment flows if to other parties. For more details see Part 1, Section 3, Sanctions & Embargoes.

7. Fraud including Market Abuse

Customers that indicate they could be operating a Boiler Room operation and/or other customers dealing in a manner raising concerns of market abuse, including insider dealing, misuse of information and market manipulation. Customers that are themselves insiders may present additional risks in some circumstances. For more details see Part 1, Sections 1, Fraud; Insider Dealing and Market Manipulation.

8. Tax Evasion

Customers that are non resident for tax purposes, may use a brokerage account to invest sums undeclared for tax purposes and use the services of the brokerage to hide these investments. A brokerage should never assist a customer in cheating its taxes, and if it becomes aware or suspects that a customer is cheating on its taxes, then it should, where tax crimes are predicate offences to money laundering, file appropriate suspicious activity reports. For more details see Part 1, Section 1, Fraud, Tax Fraud & Cybercrime.

9. Employees

Brokerages may find that some of their money laundering risks are actually quite close to home. These include insider dealing by financial advisers, through

relationships with customers who may be themselves "insiders", or as a result of working in a universal bank with an investment bank and getting unauthorised access to information or being tipped off or through other outside contacts; for misuse or interaction through front and/or parallel trading in connection with large customer orders. Also a financial adviser may exceed his authority with respect to customer activity and/or divert customer assets for his own benefit whether to make personal gain or to cover earlier undisclosed losses. For more details see Part 1, Sections 1, Fraud and Inside Information and Market Manipulation.

10. Customers with Physical or Bearer Securities

Although many jurisdictions have dematerialised securities, physical and bearer securities are still available in some jurisdictions. Bearer securities consist of both physical equity and debt securities that, unlike registered securities, do not necessarily require that the owner be registered with an issuer or a transfer agent. The transfer of bearer securities can be as simple as handing the security over to a new owner. It is important to note that the transfer of ownership can, in some jurisdictions, be almost as easily accomplished through electronic means that inhibit tracking any change of ownership. In addition, some bearer bonds are almost equivalent to cash because they can be easily redeemed at financial institutions. Low priced securities, also known as "Penny Stocks", refer to low-value equity interests in companies that are publicly traded or are about to become so. The issuers of these shares generally have legitimate business operations and revenue streams. However, some of these publicly traded entities are really shell companies that may be used for a reverse merger. In any event, shares in these issuers will often be represented with physical securities that can be deposited with a securities intermediary. These shares are not likely to be traded on traditional exchanges, but rather in over-the-counter ("OTC") markets or on bulletin boards. Penny stocks typically have very low trading volume but, unlike bearer securities, ownership of these shares will often be registered with the issuer and/or a transfer agent. These securities can be acquired by investing illicit assets into a company that is about to become public. Once the company goes public, the money launderer can sell his or her stake, thereby giving funds the appearance of having been derived from a legitimate securities transaction. In addition, Penny Stocks are often used to generate illicit assets through market manipulation, insider trading, and fraud. For more details see Part 1, Section 1, Fraud; Insider Dealing and Market Manipulation.

Commercial Banking

"Adventure is the life of commerce but caution, I had almost said timidity, is the life of banking"

Walter Bagehot, 19th century British economist & journalist

Introduction

Commercial and corporate banks have existed for as long as businesses have had the need to borrow funds. Without access to credit, many businesses either stall or find growth elusive. This is not only bad for the businesses themselves but for the broader economy and ultimately individual living standards. As banks recover from the global financial crisis of 2008, the availability of credit will increase and once more be a catalyst for economic growth. The importance of banking and in particular commercial banking should not be underestimated, both in its crucial role in developing and achieving strong, sustained and balanced growth through the ages up until now, despite the crises and its undoubtedly role in driving economic growth in the future.

Whilst financial systems and the availability of credit, particularly to support business and commerce, have long been recognised as useful, their true importance and the fact that they play a key role in economic development and growth, only received academic validation and widespread recognition approximately 50 years ago when Gurley, Shaw and McKinnon⁶ published their studies, since accepted by the IMF and World Bank.

According to their analysis, a strong financial system and the availability of credit to finance business expansion and innovation made possible the Industrial Revolutions in the West and in particular in the US where the commercialisation of technological innovation in 19th century America, beginning with the adaptation of railway engines and moving rapidly to completely new technologies, such as the telegraph and telephone as well as the creation of a truly national market were but a few examples of the importance of commercial banks.

Whilst commercial banks offer more than credit to businesses, including international trade finance, and for example, traditional retail banking and payment services, there are money laundering risks that present themselves and should be addressed.

Definition/Description

Commercial banks offer banking, credit and payment services to businesses, usually alongside similar retail

banking services to individual customers. Commercial banking customers are usually both small and medium sized enterprises (SMEs) and larger businesses, for example, major companies, or conglomerates and multinationals. Some of the products and services Commercial Banks offer include: credit and financing services (that is, asset-based lending, commercial term lending, equipment financing, capital raising and trade financing), treasury management (that is, collecting and control of payments and deposits and liquidity management) and acquisition financing. For the larger customers, commercial banks can issue large secured and unsecured loans, offer fund transfer services, cash management and treasury services and may offer similar products and services or refer customers to their investment banking division to cover, for example, needs for the issuance of securities, arranging and underwriting services for debt issuance, initial public offerings and advice on corporate restructuring and on mergers and acquisitions.

Trade Finance

One of the oldest and most popular products offered by Commercial Banks but cited as vulnerable to money laundering is Trade Finance. Trading, especially internationally, has historically required two key elements, trust and finance. Trust is especially important as the buyer and seller may have little knowledge of each other and finance is important because the goods may leave the exporter and not be received by the importer until delivery weeks later. Banks have sought to interpose themselves into international trade providing not only finance but the requisite trust to guarantee that provided the goods are shipped, documented and delivered, payment will be made. In this way banks have helped international trade flourish with about US\$18 trillion of goods exported in 2011, (ICC Banking Commission, 2013 Global Risks Trade Finance). Whilst most trade is now financed by the importers and exporters themselves on their "own account" that is directly without credit finance, in the normal way that firms have become accustomed to do so in their domestic markets, still, according to the International Chamber of Commerce (ICC), around 20% remain financed by Banks. A significant portion of this financing involves a letter of credit, which provides greater security to the exporter and is particularly popular with small firms and in developing countries. Regardless of the type of financing exporters can also buy export insurance to reduce risk, with about 11% of world trade insured in 2009. According to Swift figures in 2011, 75% of total trade traffic flows, through the system was for documentary credits, with the two largest intra region trade areas being APAC and the Middle East. APAC as a region generated the most in both

import 65% and export 72% with the Eurozone second in both cases with 10% and 11% respectively.

The US\$ was the currency used in more than 80% of Swift Trade Messages, followed by the € at 12% and JPY at 4%. The average value of a letter of credit in 2011 was US\$603,000 (ICC Global Survey 2012, Rethinking Trade and Finance). There are a number of important products offered in connection with the financing of trade, used by exporters and importers, that are not comfortable taking the risk of cash or product in advance, or part advance that is, own account or on consignment, where the goods are shipped but not sold and legal title does not pass until actual payment, whether in part or in full. Although most trade finance is short term and self liquidating in nature, medium term loans (1-5 years) and long term loans (over 5 years) may be used to finance the export of capital goods such as machinery and equipment. The most common products include: Letters of Credit: the purchaser (importer) wishing to reduce risk may require the seller to document the goods that have been shipped, taking a letter of credit from his bank and providing this to the exporter (or the exporter's bank) providing for payment upon presentation of certain documents, such as a bill of lading. The exporter's bank may make a loan (by advancing funds) to the exporter on the basis of the letter of credit. In other words, if the buyer defaults on the payment, it is the responsibility of the buyer's bank to make the payment. This undertaking can be given either in writing or through authorised electronic medium. Other forms of trade finance can include documentary collection, standby letters of credit and/or guarantees, trade credit insurance, export factoring, and forfeiting. In many countries, trade finance in key or strategic industries, is often supported by quasi-government entities known as export credit agencies that work with commercial banks and other financial institutions.

The international trade system is subject to a wide range of risks and vulnerabilities that provide criminal organisations with the opportunity to launder the proceeds of crime and move funds to terrorist organisations with a relatively low risk of detection. Whilst the abuse of the trade system is much more likely the abuse of trade finance products remains possible. The involvement of multiple parties on both sides of any international trade transaction and because trade finance can be more document-based than other banking activities, it can be susceptible to documentary fraud, which can be linked to money laundering, terrorist financing, or the circumvention of sanctions or other restrictions (such as export prohibitions, licensing requirements, or controls). For letters of credit and bills

of collection, two of the main products within trade finance, the commercial bank, will of course conduct due diligence on its own customer and on the bank with which it is dealing, but not usually on the customer's customer or the other bank's customer (that is, the same other party or the beneficiary) as this should be done by the Customer and/or the other Bank, though there may be occasions where this may be necessary, for example, if such a party or transactions posed increased risks. Banks are heavily dependent upon the information provided in the documentation submitted by the customer. The degree of scrutiny will often vary depending upon the product offered, the role in the transaction, and the geographies and traded goods involved. A review of the countries involved in the transaction, the type of goods involved, whether there is a third party or intermediary involved and if there are any anomalies in the documentation that suggest suspicious or illegal activity, may indicate increased risks. In particular transactions involving countries subject to sanctions and embargoes or involving higher-risk goods (for example, trade in weapons or nuclear equipment), will obviously require increased attention. As always with any transaction, screening customers against applicable lists should be commonplace. Beyond these controls it should be understood that whilst commercial banks oil the wheels of commerce through trade finance they are rarely in a position or have the capacity to become experts in what is and what is not dual use goods for example and/or understand fully the underlying economics of all trade transactions, to positively prove or demonstrate evidence to verify the efficacy of the goods involved, nor to verify the actual goods traded are those that are the subject of the trade finance transaction. Government agencies including law enforcement, customs authorities, and intelligence agencies are best placed to prevent and detect trade laundering. Additional scrutiny to be considered in exceptional cases include additional KYC or information such as frequency and number of transactions, volumes of the goods (for example, in relation to the client's production capacity), amounts involved (in absolute terms as well as in relation to the goods), diversity of counterparties and frequent irregularities in the settlement of a trade finance transaction.

While banks should be alert to risks presented by organised crime, terror finance and WMD proliferators including sanctions busters, they also need to consider and be aware that goods may be over, or under-valued in an effort to move funds or value across national borders, including to avoid customs or capital control regulations. For example, an importer may pay a large sum of money from the proceeds of an illegal activity for goods that are essentially worthless and are

subsequently discarded. Alternatively, trade documents, such as invoices, may be fraudulently altered to hide the scheme. Variations on this theme include inaccurate or double invoicing, partial shipment of goods (short shipping) and the use of fictitious goods. Illegal proceeds transferred in such transactions thereby appear sanitised and enter the realm of legitimate commerce. Moreover, many suspect trade finance transactions also involve collusion between buyers and sellers. For more details on so called trade based money laundering see Part 1 Section 1 Fraud including tax fraud and cybercrime. Financial crime risks in trade finance was investigated by UK FCA in its 2013 thematic review entitled "Banks' control of financial crime risks in trade finance" which found that whilst banks had developed effective controls to ensure they were not dealing with sanctioned entities and individuals, policies and procedures and controls to counter money laundering risk were generally weak and most bank's had inadequate systems and controls over dual use goods.

The main findings were that there was an inconsistent approach to risk assessment and only a few banks had conducted a specific trade finance money laundering risk assessment. About half the banks had no clear policy or procedures dealing with trade based money laundering risks, few banks produced useful management information on financial crime risks in trade finance businesses, smaller banks had not produced tailored training, and many AML Compliance staff were inadequately aware of money laundering risks for trade finance. Naturally the sophistication of the money laundering prevention programme adopted by a bank should be commensurate with the size and complexity of the bank's trade finance portfolio and its role in the trade finance process. The Money Laundering Prevention Programme should consider and give greater scrutiny to: items shipped that are inconsistent with the nature of the customer's business (for example, a steel company that starts dealing in paper products, or an information technology company that starts dealing in bulk pharmaceuticals); customers conducting business in higher-risk jurisdictions; customers shipping items through higher-risk jurisdictions, including transit through higher-risk jurisdictions; customers involved in potentially higher-risk activities, including activities that may be subject to export/import restrictions (for example, equipment for military or police organisations of foreign governments, weapons, ammunition, chemical mixtures, classified defense articles, sensitive technical data, nuclear materials, precious gems, or certain natural resources such as metals, ore and crude oil); obvious over, or under-pricing of goods and services; obvious misrepresentation of quantity or type of goods imported or exported; transaction

structures that appear unnecessarily complex and designed to obscure the true nature of the transaction; customer payments of proceeds to unrelated third parties; shipment locations or description of goods not consistent with letter of credit; significantly amended letters of credit without reasonable justification or changes to the beneficiary or location of payment. Absent indicative increased risk factors and unless customer behavior or transaction documentation appears unusual, the bank should not be expected to spend undue time or effort reviewing all information.

Top 10 Goods traded internationally (US\$ trillion)		
1	Mineral fuels, oils, distillation products etc	2.1
2	Electrical, electronic equipment	1.8
3	Machinery, nuclear reactors, boilers	1.76
4	Vehicles other than railway	1.1

Money Laundering/Terrorist Financing Risks

Commercial banking can generally be considered as presenting **moderate to high** inherent AML risks.

Top ML Risks in Commercial Banking		
1	Customers with cash businesses	
2	Customers with sensitive businesses	
3	Customers with material sensitive country risk exposures	
4	Politically Exposed Persons	
5	Charities or other Not for Profit Organisations	
6	Sanctioned or other problematic customers	
7	Corruption slush funds	
8	MTIC/Carousel and/or other tax frauds	
9	Trade based money laundering incl TF	
10	Fraud	

Source: Author

Commercial banking is potentially vulnerable to and/or could be abused in a number of ways. Here are the top inherent ML related risks facing a commercial bank.

1. Customers with Cash Businesses

Customers that have businesses that deal in cash in large amounts, high value and/or with a large number of transactions are highly vulnerable to being used by money launderers as a vehicle to covert and launder the proceeds of crime. Slot machines within casinos or gambling houses were in part originally designed to take coins which were in those days equivalent to the cash notes earned today by criminals. Other coin intensive businesses like laundromats were also useful and attractive businesses for the criminal. There are few high value and/or retail businesses that couldn't be used though a few are considered particularly vulnerable and these include; high value goods dealers, for example, real estate agents; art dealers including (auctioneers); precious metals and stones dealers (including jewellers); car, plane and yacht dealers; watch dealers, equine or other high bred animal dealers; and cash intensive businesses including; retail outlets such as garages, restaurants, ice cream parlours, clubs (including strip bars) and bars, golf clubs, bowling alleys, private ATM companies, sauna and massage parlours and of course laundromats. There are some businesses that could fall into both categories and these include; money service businesses, both regulated and unregulated; jewellers; auctioneers and casinos. Banks may monitor aggregate cash or cash like activity, identifying unusually significant cash or cash like values and volumes and/or material changes and investigate material cases to identify whether there is satisfactory explanation or justification. Comparing customer businesses may also be useful in order to identify an outlier for further investigation. For more details on some of these businesses see Part 1, Section 2, Sub-section 2, Cash-Intensive Businesses, High Value Goods Dealers, Precious Metals & Stones Dealers and Real Estate Agents.

2. Customers with Sensitive Businesses

Other businesses accounts where cash is a large part of the activity may also present risks, particularly if they would not ordinarily be considered normally cash intensive, for example, embassy or consulate accounts. The following may also present risks: business accounts for arms dealer companies or private military firms; businesses that make and/or distribute war materials, in particular controversial weapons (nuclear, chemical or biological or cluster munitions and anti-personnel mines) or dual use goods may present additional risks, businesses involved in mining and minerals, particularly if involved in so called, mountain top removal, forestry

or logging businesses, particularly if involved in palm oil extraction leading to deforestation; businesses with poor human rights records or a record of environmental damage; businesses involved in waste management and scrap metal dealers and businesses that have been identified as posing increased corruption risks themselves, particularly when combined with increased country risks as set out in 3. below. For more details see Part 1, Section 2, Sub-section 1, Money Laundering Risks.

3. Businesses with Material Sensitive Country Risk Exposures

Customers, in particular customers with sensitive businesses that are based in or have material exposures to countries that have been identified as posing increased risks, for example countries the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. This also for customers owned or also time controlled by or dealing with sovereign governments and publicly owned entities from such countries, including Sovereign Wealth Funds and municipalities. For more details see Part 1, Section 1, Bribery & Corruption; Terrorism Finance & WMD Proliferation Finance and Part 1, Section 3, Sanctions & Embargoes.

4. Politically Exposed Persons

Businesses that are either owned or controlled by, or where the beneficial owner is Politically Exposed Person. For more details see Part 1, Section 1, Bribery and Corruption and Part 1, Section 2, Sub-section 2, Politically Exposed Persons.

5. Charities or other Not for Profit Organisations

Charities or other Not for Profit Organisations, which could be either supervised or effectively or insufficiently unsupervised that raise, store, move and/or use money for charitable and other humanitarian causes that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as connected and/or involved in terrorism finance. Organisations providing humanitarian or other similar relief have been used and abused in particular as fronts for Islamic terrorism financing. For more details see Part 1, Section 2, Sub-section 2, Charities and other Not for Profit Organisations.

6. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation etc. Banks must be wary

in particular to screen customers, including corporates and businesses for example, against known terrorists and major criminals against lists of persons made available prior to opening of accounts and against payment flows through the bank. For more details see Part 1, Section 3, Sanctions & Embargoes.

7. Corruption Slush Funds

Business accounts that establish what looks like a so called, "slush fund." Whilst many bribes are demand led and could be considered extortion, that is no excuse for any business to pay a bribe for or in relation to a commercial contract. Nevertheless, otherwise legitimate businesses have paid bribes, and no doubt despite the criminality and the consequences some will continue to do so. Industries prone to bribes include public works contracts and construction, oil and gas, mining, real estate and property development. There are also real concerns over some contracts and dealings in the arms industry and with private military firms. It is unusual for a bribe to be paid directly or for it to be described as such or to be transparent and the use of intermediaries is common. It is also common for businesses that may consider making or facilitating bribes to have company money segregated from normal company funds or funds come from an already established "slush fund". In cases where companies have established a slush fund this has typically been outside the home country of the parent company, most often in an offshore centre or tax haven, with the funds being off-balance sheet or largely unaccounted for, and under the sole signature of a senior employee or even ex-employee. For more details see Part 1, Section 1, Bribery & Corruption, Part 1, Section 2, Sub-section 2, Arms Dealers, Intermediaries and Private Military Firms.

8. MTIC/Carousel and or other Tax Frauds

Businesses, particularly new small start up businesses, with individuals without a business track record or strong references that engage in export and import in and out of the EU in goods such as mobile phones, computer chips, cosmetics, precious metals and computer software or other easily portable goods which quickly then close down after large volumes and cross border payments are processed may be involved in MTIC/carousel Fraud. For more details see Part 1, Section 1, Fraud, Tax Fraud & Cybercrime.

9. Trade Based Money Laundering including Trade Finance

Business accounts that may indicate risks relating to Trade Based Money Laundering ("TBML"), including trade finance is practised to hide criminally derived proceeds and move value through the use of trade transactions in an attempt to legitimise

their illicit origins. TBML can be done through the misrepresentation of the price, quantity or quality of imports or exports and it can use techniques that vary in complexity and are frequently used in combination with other money laundering techniques to further obscure the money trail. The most common techniques of TBML are (i) over- and under-invoicing of goods and services (ii) over- and under-shipment of goods and services (iii) multiple invoicing of goods and services (iv) falsely describing goods and services on custom forms. The technique of over- and under-invoicing of goods remains a common method used to fraudulently transfer value across borders with the importer and exporter working in collusion together. Often the importer and exporter are part of the same corporate organisation, making the transfer even more difficult to detect. By invoicing the goods or service at a price below market price, the exporter is able to transfer value to the importer as the payment they will be required to make is less than the amount the importer will earn when the goods are sold in the market. Alternatively, by invoicing the goods or service at an above market price, the exporter is able to receive value from the importer as the payment for the goods or service is less than the value the importer will earn when it is sold in the market. Therefore, the over- and under-invoicing of exports and imports can have significant tax implications. An exporter who over-invoices the value of the goods they ship may be able to raise the amount of the export tax credit (or VAT rebate) they receive. It should be noted that in extreme situations, there may not be any goods shipped at all but collusion between parties to provide false documentation to customs agents and/or to banks. Therefore, banks may unwittingly be involved in such "phantom" shipments. The use of false descriptions can also be used in the trade of services such as financial advice, consulting services and market research. In June 2008 the FATF published a best practices paper titled Best Practices on Trade Based Money Laundering⁷ in which the red flags associated with TBML were listed. For more details see Part 1, Section 1, Fraud, Tax Fraud & Cybercrime. For Trade Finance see above, earlier in this section on Commercial Banking.

10. Fraud

Customers applying for and receiving credits or other financial assistance based on misrepresented facts and figures, either directly or through company account fraud or sinks. For more details see Fraud, Tax Fraud & Cybercrime in Part 1, Section 1.

Correspondent Banking

"US correspondent banking provides a significant gateway for rogue foreign banks and their criminal clients to carry on money laundering and other criminal activity in the US and to benefit from the protections afforded by the safety and soundness of the US banking industry."

US Senate Permanent Subcommittee on Investigations, Report, Correspondent Banking: A Gateway for Money Laundering 2001⁸

Introduction

As far back as 2001, there were some concerned that correspondent banking offered high risk foreign banks access to the US financial system by opening correspondent accounts at US banks or at foreign banks that already had a US correspondent bank account, that an investigation was conducted and a report issued by the US Senate Permanent Sub-committee on Investigations, entitled 'Correspondent Banking: A Gateway for Money Laundering.' It provided the inside story and a wake up call, focussing on the operations of ten foreign banks that had used major US banks to move and launder millions of dollars obtained through drug trafficking, financial frauds, bribes, tax evasion and illegal gambling operations.

Whilst much has certainly been done to improve standards both in the US and elsewhere, there remains concern that some of the underlying inherent vulnerabilities remain and that unless standards are maintained and AML Programmes are robust, correspondent banking will continue to be abused and criminals will take full advantage.

Definition/Description

Correspondent banking is the provision of banking-related services by one bank (correspondent) to another bank (respondent) often overseas to enable the respondent to receive deposits from, or make payments or other disbursements from that account with the correspondent, both for own correspondent and for the respondent's customers' cross border purposes that it cannot provide itself, typically due to a lack of an international network. Foreign financial institutions maintain correspondent accounts at domestic banks to facilitate international trade and investment by gaining access to the financial system and its products and services. The scope of a relationship and extent of products and services supplied will vary according to the needs of the respondent, and the correspondent's ability and willingness to supply them (sometimes dictated by the risk rating assigned to the respondent) but may include: cash management services, including deposit

accounts; international funds transfers; cheque clearing; payable through accounts; pouch activities; foreign exchange services; overnight investment accounts; loans and letters of credit, again for both the bank itself and for its customers which could also include other banks.

Whilst FATF does not define correspondent banking it does provide an entire Recommendation, now R.13⁹ to set out the "Additional Measures" stating that "Financial institutions should be required, in relation to cross border correspondent banking and other similar relationships, in addition to performing normal customer due diligence measures, to: (a) gather sufficient information about a respondent institution to understand fully the nature of the respondent's business and to determine from publicly available information the reputation of the institution and the quality of supervision, including whether it has been subject to a money laundering or terrorist financing investigation or regulatory action; (b) assess the respondent institution's AML/CFT controls; (c) obtain approval from senior management before establishing new correspondent relationships; (d) clearly understand the respective responsibilities of each institution; and (e) with respect to "payable-through accounts", be satisfied that the respondent bank has conducted CDD on the customers having direct access to accounts of the correspondent bank, and that it is able to provide relevant CDD information upon request to the correspondent bank.

FATF also provide that: "Financial Institutions should be prohibited from entering into, or continuing, a correspondent banking relationship with shell banks.¹⁰ Financial institutions should be required to satisfy themselves that respondent institutions do not permit their accounts to be used by shell banks."

Whilst many states have individual statutory provisions applying the FATF R.13, much in the way they have for R.12 on PEPs, the USA Patriot Act,¹¹ S.312, is an example of where a State has set out in more detail the expectations on financial institutions in this respect. S.312 contains a provision requiring US financial institutions to apply enhanced due diligence when establishing or maintaining correspondent accounts of a foreign bank that is operating: (i) under an offshore license; (ii) in a jurisdiction found to be non-cooperative with international anti-money laundering principles; or (iii) in a jurisdiction found to be of primary money laundering concern under Section 5.311 of the same Act.

The Section also requires US financial institutions to take reasonable steps to: (i) conduct appropriate enhanced scrutiny; (ii) determine whether the foreign

bank itself offers correspondent accounts to other foreign banks (for example, payable through so-called nested accounts) and, as appropriate, identify such foreign bank customers and conduct additional due diligence on them; and (iii) identify the owners of such foreign bank, if its shares are not publicly traded.

Following the Patriot Act, the Wolfsberg Group issued its own Correspondent Banking Principles¹² in 2002 which were considered then good practice in dealing with correspondents, and in particular when it comes to due diligence and monitoring, supplementing these with Correspondent Banking FAQs in 2006. The Group is currently working on a further update expected to be published in 2013.

In June 2013 BCBS published a consultative document entitled "Sound Management of Risks related to Money Laundering and Financing of Terrorism" and in Annex 2 thereof listed a number of factors that should be considered in evaluating the risk of counterparty correspondent banks. The paper states that: "Banks that undertake correspondent banking activities should conduct an appropriate assessment of the ML/TF risks associated with correspondent banking activities and consequently apply appropriate CDD measure. Correspondent banks should gather sufficient information, at the beginning of the relationships and on a continuing basis after that, about their respondent banks to fully understand the nature of the respondent's business and correctly assess ML/TF risks on an ongoing basis. Factors that correspondent banks should consider include: the jurisdiction in which the respondent bank is located; the group to which the respondent bank belongs, and the jurisdictions in which subsidiaries and branches of the group may be located; information about the respondent bank's management and ownership (especially the presence of beneficial owners or PEPs), its reputation, its major business activities, its customers and their locations; the purpose of the services provided to the respondent bank; the bank's business including target markets and customer base; the condition and quality of banking regulation and supervision in the respondent's country (especially AML/CFT laws and regulations); the money laundering prevention and detection efforts of the respondent bank; a description of the CDD applied by the respondent bank to its customers; the identity of any third-party entities that will use the correspondent banking services; information on any possibility of a chain of correspondent banking and information on the AML/CFT policies and procedures may rely on any questionnaire filled by the respondent or on publicly available information provided by the respondent (such as financial or any mandatory supervisory information).

Money Laundering/Terrorist Financing Risks

Transactions through foreign correspondent accounts are typically large and permit movement of a high volume of funds relatively quickly. These correspondent accounts also provide foreign entities with ready access to international banking systems. These banks and other financial institutions may be located in countries with unknown AML regulations and controls ranging from strong to weak, corrupt, or nonexistent. A correspondent handling transactions which represent the proceeds of criminal activity or terrorist financing risks, may be subject to regulatory fines and/or damage to its reputation. For these reasons, correspondent banking is considered to be one of the highest risk products offered by a financial institution and financial institutions have to demonstrate that they have adequate processes and controls to recognise and manage the risk that it can be used for illicit activity.

The risks are well described by going back to the US Senate Permanent Subcommittee on Investigations, Report, Correspondent Banking: A Gateway for Money Laundering 2001 where the minority staff found that as at that time: (i) correspondent banking provides a significant gateway for rogue foreign banks and their criminal clients to carry on money laundering and other criminal activity in the US and to benefit from the protections afforded by the safety and soundness of the US banking industry; (ii) offshore banks, shell banks, and banks in jurisdictions with weak bank supervision carry particularly high money laundering risks, and US banks have routinely established correspondent relationships with such banks; (iii) most US banks do not have adequate anti-money laundering safeguards in place with respect to correspondent banking, and this problem is longstanding, widespread and ongoing; (iv) high risk foreign banks that are denied their own correspondent accounts at US banks can obtain the same access to the US financial system by opening correspondent accounts at foreign banks that already have a US bank account; and (v) in the last three years, some US banks have become concerned about the vulnerability of correspondent banking to money laundering and are taking some steps to reduce the money laundering risks, but the steps are slow, incomplete, and not industry-wide.

Based on its findings, the Minority Staff recommended that: (a) US banks should be barred from opening correspondent accounts with shell banks; (b) banks should be required to use enhanced due diligence and heightened anti-money laundering safeguards as specified in guidance or regulations issued by the US Treasury Department before opening correspondent accounts with foreign banks that have offshore

licenses or are licensed in jurisdictions identified by the US as non-cooperative with international anti-money laundering efforts; (c) banks should conduct a systematic review of their correspondent accounts with foreign banks to identify high risk banks and eliminate problem banks and should strengthen their anti-money laundering oversight; (d) banks should be required to identify a respondent bank's correspondent banking clients, and refuse respondent banks that allow shell foreign banks or bearer share corporations to use their US accounts; and (e) bank regulators and law enforcement officials should offer improved assistance to US banks in identifying and evaluating high risk foreign banks.

Whilst the report is US specific, its findings clearly applied elsewhere too, albeit the US Currency has always been the most popular currency amongst foreigners besides their own and likely also by criminals. Whilst much has been done including, shutting out shell banks, and restricting access to offshore banks, to improving bank AML Programmes across the board, little has been done to either identify non-co-operative foreign jurisdictions or to identify individual high risk foreign banks, although banks have internal risk based country models, and so some of these banks are likely still to be able to access the international financial system.

Out of all the activities conducted with correspondent banks and through or affecting the account, some possess much higher risks than others. For example, conducting proprietary activity of the other bank, perhaps trading and settlement, treasury and FX business, or fund execution and settlement can all be considered lower risk. At the other end of the risk spectrum are third party wire transfers, particularly payable through accounts and downstream clearing or so-called nested accounts, banknotes, precious metals and pouch services which are commonly offered as part of a correspondent banking relationship and involve the transmission and processing of monetary instruments, for example, money orders, traveller's cheques, and bank cheques.

As cross border wire transfers come under increased scrutiny and regulation, criminals have found paper cheques, money orders, and cashier's cheques to be an effective method to move money internationally. These more traditional payment instruments take a longer time to clear and be available for use but are perceived by money launderers as being subject to less scrutiny. Although wire transfers are used in many legitimate ways, most money launderers use wire transfers to aggregate funds from different sources and move them

through accounts at different banks until their origin cannot be traced. Despite being deemed as high-risk and subject to increased scrutiny, wire transfers are still frequently used in the layering stage of money laundering. Successive wire transfers allow the originator and the ultimate beneficiary of the funds to obtain relative anonymity, disguise the money trail, easily aggregate funds from a large geographic area, move funds out of or into a country, and legitimise illegal proceeds. The money launderers can also wire the funds to offshore accounts in countries with secrecy laws in place. It can be challenging for financial institutions to identify suspicious transactions due to the large number of wire transactions that occur in any given day.

Correspondent banking can generally be considered as having **high** inherent AML risks. The following are the top inherent money laundering risks for a correspondent bank.

Top ML Risks in Correspondent Banking	
1	Shell Bank Customers or Banks with Shell Banks as Customers
2	Offshore Banks
3	Non-Bank Financial Institutions, eg MSBs
4	Customers with Material Sensitive Country/ PEP Risk Exposures
5	Sanctioned or Other Problematic Customers
6	Group Companies, Parents, Subs and Affiliates
7	Wire Transfers
8	Payable Through Accounts
9	Pouch Services
10	Downstream Clearing/Nested Accounts
11	Banknote/Precious Metals Services
Source: Author	

1. Shell Bank Customers or Banks with Shell Banks as Customers

Shell bank customers are to be avoided, be it as direct or indirect customers of a bank. A shell bank means a bank that (1) does not conduct business at a fixed address in which it is authorised to conduct banking activities, (2) does not employ anybody on a full time basis at that fixed address, (3) does not maintain operating records at that address, (4) is not subject to inspection by the banking authority that licensed it to conduct banking activities. A post office box or electronic address is not a "fixed address" for these purposes.

2. Offshore Banks

Offshore banks are those banks that have a limited banking license that does not allow it to conduct business with citizens of, or in the local currency of, the country that issued the license. There are particular risks when dealing with a bank holding an offshore banking license as the jurisdiction in which it operates may have lax AML controls and standards or inadequate regulatory oversight. However, a proper assessment of the nature of an offshore license is necessary as not all will be of concern for example, as certain jurisdictions see an offshore licence as "a probation period" before banks can obtain an onshore licence. Offshore banks that are part of a banking group will generally present less risks.

3. Non-Bank Financial Institutions (for example MSBs)

Money Services Business and other non-bank financial institutions for example, remittance businesses, exchange houses and similar businesses such as those known as "Doleiros" and "Casa de Cambios" have long been identified as presenting risks for correspondent banks, whether providing direct banking accounts or indirect via downstream or nested accounts with banking correspondents (see below). Of course unregulated MSBs including, "Hawala", "Hundi", "Chop" etc. should be avoided if identified. For more details see Part 1, Section 2, Sub-section 2, Money Services Business.

4. Customers with Material Sensitive Country/PEP Risk Exposures

Customers, in particular bank customers, are based in or have material exposures to countries that have been identified as posing increased risks, for example, countries which are the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. Bank customers' client base and operations as well as ownership and domicile will also be relevant. This is also for customers owned or controlled by or having material connections with PEPs, for example, the PEP is either in a governing position or is to a significant extent the owner or controller of the bank customer or exerts significant influence. For more details see Part 1, Section 2, Sub-section 2, Politically Exposed Persons.

5. Sanctioned or Otherwise Problematic Customers

Bank customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance or WMD proliferation etc. Banks must be wary to screen bank customers and transactions but also to identify

bank customers that have branches, or affiliates with a presence in or otherwise material business interests in so called sanctioned countries which may also be of concern. For more details see Part 1, Section 3, Sanctions & Embargoes.

6. Group Companies, Parents, Subs and Affiliates

Banking groups, particularly large international ones, will often offer correspondent banking accounts to other group companies but in so doing should not assume that such a relationship does not present similar risks to those offered by third party banks. Whilst parent banks may apply group wide standards and may have access to information about all group companies, some may not and beyond parents the same may not be able to be said for other group companies. As such intra-group bank customers should also be subject to a risk assessment, risk rating and appropriate due diligence and scrutiny.

7. Wire Transfers

There are a variety of methods for making payments from one party to another, from the most basic form of using cash, to issuing a cheque, to making payment with a debit or credit card, paying with a prepaid card to making a wire transfer between bank accounts. The same is true for international payments where most popular is the wire transfer, followed by the transfer of cash at a cash office such as Western Union, but international foreign currency cheques can also be used and available from a bank, where a person has an account, and increasingly especially with the rise of the Internet by the increased use of debit and credit cards. As payments from one currency to another will incur charges, there are also some more specialist services such as online currency brokers, that will make payments also, usually at better rates than those offered by Banks.

Although simple, sending cash through the post and particularly overseas isn't recommended, with some countries prohibiting sending cash in the post, the security concerns are obvious. As a result many people use Cash Transfer or Money Remittances Businesses, for example provided by companies such as American Express, Western Union and MoneyGram or by so called Casa De Cambios or FX Exchange Houses. An alternative could be a Prepaid card which can be purchased and loaded with an amount and shipped to the recipient with the PIN being communicated separately. International cheques are expensive and take time to ship and to clear, whilst credit and debit cards are good for low value amounts but not for higher amounts.

That leaves electronic or wire transfers. Wire transfers originated in the 19th century, sent over telegraph

lines. This process gave them their name wire as telegraphs were transmitted over wires. Bank wire transfers are often the cheapest method for transferring funds between bank accounts. A bank wire transfer is effected as follows: The entity wishing to do a transfer approaches a bank and gives the bank the order to transfer a certain amount of money. IBAN and BIC codes are given as well so the bank knows where the money needs to be sent. The sending bank transmits a message, via a secure system (such as SWIFT or Fedwire), to the receiving bank, requesting that it effect payment according to the instructions given. The message also includes settlement instructions. The actual transfer is not instantaneous: funds may take several hours or even days to move from the sender's account to the receiver's account. Either the banks involved must hold a reciprocal account with each other, or the payment must be sent to a bank with such an account, a correspondent bank, for further benefit to the ultimate recipient. Banks collect payment for the service from the sender as well as from the recipient. The sending bank typically collects a fee separate from the funds being transferred, while the receiving bank and intermediate banks through which the transfer travels deduct fees from the money being transferred so that the recipient receives less than what the sender sent.

Banks in the US use the CHIPS or Fedwire system to actually effect the payment. Domestic bank-to-bank transfers are conducted through the Fedwire system, which uses the Federal Reserve System. Other forms of electronic transfers include, for example, Electronic funds transfer system (EFTS). This is the system used when someone gives a bank account number and routing information to someone owed money and that party transfers the money from that account. It is also the system used in some payments made via a bank's online bill payment service. EFTS transfers differ from wire transfers in important legal ways. An EFTS payment is essentially an electronic personal check, whereas a wire transfer is more like an electronic cashier's check. In the United States, such EFTS transfers are often called "ACH transfers," because they take place through the Automated Clearing House. One important way ACH transfers differ from wire transfer is that the recipient can initiate it. There are of course restrictions, but this is the way people often set up automatic bill payment with utility companies, for example.

Banks in the UK use BACS and CHAPS. BACS is an electronic system that for many years has been used to process Direct Debits, direct credits and standing orders for UK banks, whereas CHAPS is a same-day UK domestic electronic transfer payments system.

Countries around the world will have their own systems similar to those in the US and the UK.

A telecommunications network, the Society for Worldwide Interbank Financial Telecommunications (SWIFT),¹⁵ is most often used to send messages with international wire transfers. The SWIFT network has been built by internationally active financial institutions and is currently available to just over 10,000 users from 212 countries. The Swift network is relied upon for the transmission of more than six billion messages annually and almost 20 million per day. Payment messages make up 49% of the total followed by securities with 44%, treasury 5.6%, trade 0.9% and others including to do with the system itself 0.3%. As far as regions are concerned EMEA has 67% of the total traffic, the Americas 20% and APAC 12.4%. The increasing complexity of the financial market and payments systems (of which SWIFT, owned by the institutions themselves, remains the largest) have resulted in vast numbers of individuals and entities seeking to use the framework to transmit funds around the world for personal, commercial and, on occasions, illicit purposes. It is not unusual for the person sending the funds (the remitter) to have an account with a financial institution that not only does not have a wide global presence but also does not have any form of direct commercial relationship with the bank holding the account of the individual or entity to whom the funds are being transmitted (the beneficiary). It may also be the case that the funds are being transmitted in a currency other than the local one in either jurisdiction and this will usually involve US\$ or € transactions.

Asia Region	12.4%
Source: SWIFT 2012	

In recognition of this challenge, smaller institutions establish relationships with larger institutions which are better connected, trade in different currencies and can be used to form a chain through which the funds

can be passed from the remitter to the beneficiary. This chain, which can involve as few institutions as three or four but potentially many more, requires the exchange of messages and information detailing the amount to be moved, the destination from which and to which the funds are travelling and the details of both the remitter and the beneficiary in order to ensure that the correct financial postings can be made at each of the institutions involved. Institutions other than those associated with the remitter and the beneficiary pay fees to the intermediate institutions (and also the transaction framework provider, for example, SWIFT) for the privilege of using them to form the payment chain.

Whilst information in a wire is sufficient to ensure the payment is made from and to the right destination, the information is by necessity limited. Banks in the payment chain, other than the remitter, have no opportunity to perform due diligence on the individuals and entities for whom they are moving funds as their only direct contractual relationship is with the remitting financial institution. The intermediary institutions are therefore moving funds on behalf of their customers' customer, someone with whom they have no direct relationship and have no opportunity to review and decide whether or not to proceed. Despite this difficulty, financial institutions want and need to try and satisfy themselves that their customer, the remitting or beneficiary institution, has adequate processes and controls in place to ensure that appropriate due diligence and other checks have been conducted at the time the remitting individual or entity opened the account from which the funds are being moved. Financial institutions will also need to monitor and scrutinise transactions to identify suspicious or unusual transactions and to identify transactions to prevent sanction violations.

An area of particular concern was the perceived lack of transparency in the payments messaging systems and in particular concerns over the abuse of so called bank to bank or cover payments to hide true remitters from the payment chain and the manipulation of data in payments to hide, for example, the names of sanctioned parties so that payments could still be processed and correspondent bank's payment filter protection systems would be bypassed.

In 2007, US regulators approached a number of financial services industry groups, including the Wolfsberg Group, expressed their concerns about the abuse of Bank to Bank or cover payments and asked the industry to design a solution to the problem on the basis that they were the system specialists and that any system designed and implemented by the regulators

without consultation with the industry would present additional implementation challenges. Industry representatives then worked to develop a number of alternative proposals and consulted widely before settling on a solution that has fixed the problem, with implementation in 2009.

In addition, in order to address the issue regulators raised around deliberately omitting customer details in order to avoid detection and blocking of these payments, the Wolfsberg Banks, which together covered a significant amount of correspondent banking payments made worldwide, issued a message to all their correspondent banks reminding them that they should abide by new "Transparency Principles" which they were expected to do, in order to maintain accounts, and in particular to ensure that so called "wire stripping" was not undertaken.

8. Payable Through Accounts

A Payable Through Accounts ("PTA") is an account through which a bank may extend cheque writing privileges to its bank customers. PTAs have long been used in the US by credit unions (for example, for checking account services) and investment companies (for example, for checking account services associated with money market management accounts) to offer customers the full range of banking services that only a commercial bank has the ability to provide. Under an international PTA arrangement, a domestic financial institution opens a master checking account in the name of a foreign bank operating outside the domestic location. The master account is subsequently divided by the foreign bank into "sub-accounts" each in the name of one of the foreign bank's customers. Each sub-account holder becomes a signatory on the foreign bank's account at the domestic banking entity and may conduct banking activities through the account. While PTAs provide legitimate business benefits, the operational aspects of the account make it particularly vulnerable to abuse as a mechanism to launder money. Sub-account holders of the PTA master accounts at the domestic banking entity may include other foreign banks, rather than just individuals or corporate accounts. These second-tier foreign banks then solicit individuals as customers. This may result in thousands of individuals having signatory authority over a single account at a domestic banking entity. The PTA mechanism permits the foreign bank operating outside the domestic location to offer its customers, the sub-account holders, domestic currency denominated cheques and ancillary services, such as the ability to receive wire transfers to and from sub-accounts and to cash cheques. Cheques are encoded with the foreign bank's account number along with a numeric code to

identify the sub-account. Deposits into the domestic master account may flow through the foreign bank, which pools them for daily transfer to the domestic banking entity. Funds may also flow directly to the domestic banking entity for credit to the master account, with further credit to the sub-account.

9. Pouch Services

Pouch activity includes the use of a common carrier to transport currency, monetary instruments and other documents from a foreign country to a domestic bank account. Pouches can originate from an individual or another financial institution and can contain any kind of document, including all forms of bank transactions such as demand deposits and loan payments. The contents of the pouch are not always subject to search while in transport, and considerable reliance is placed on the financial institution's internal control systems designed to account for the contents and their transfer into the institution's accounts.

A prime benefit of having pouch services is the efficiency and speed with which international transactions can be deposited in another banking system by avoiding clearing a transaction through several international banks in order to move the funds abroad.

Pouch systems can be exploited by those looking for an avenue to move illegally-gained funds into another country in order to legitimise the proceeds and obscure the true source of the funds. Pouches are used to transfer bulk currency, both domestic and foreign and sequentially numbered monetary instruments. For instance, large dollar amounts can be transferred via pouch in the form of numerous cheques or money orders from various locations, with each payment below the reporting threshold. The payments are mailed or transported to accomplices overseas who deposit the cheques and other payments in foreign bank accounts. The foreign banks that receive them send them back for deposit in their correspondent accounts. The cheques and money orders are bundled up at the foreign banks and sent with a deposit slip with the details of each cheque and money order. The correspondent credits the Respondent's account and routes the individual payment instruments to the appropriate paying banks and other institutions.

Some banks handle millions of cheques a day delivered by shipping companies in pouches and overnight bags which makes it very difficult to aggregate related payments or scrutinise individual payments for evidence of money laundering. Once these illegal funds are deposited into the foreign correspondent accounts, they can be moved, mainly via wire transfer, anywhere in the

world.

10. Downstream Clearing/Nested Accounts

Foreign correspondent accounts provide clearing access to foreign financial institutions and their customers may include other foreign banks. High-risk foreign financial institutions have gained access to financial systems by operating through domestic correspondent accounts belonging to other foreign banks. These are commonly referred to as "nested" correspondent banks. Such nested correspondent bank relationships result in the financial institution's inability to identify the ultimate customer who is passing a transaction through the foreign correspondent's domestic account. These nested relationships may make it harder for the financial institution to effectively comply with due diligence standards, suspicious activity reporting, and economic sanctions monitoring.

11. Banknote/Precious Metals Services

Whilst not that common, it is possible to undertake precious metals and banknote services via correspondent banking accounts. Risks exist in particular, where physical settlement is involved in both cases. For more details see Part 1, Section 2, Sub-section 2, Precious Metals & Stones Dealers.

Credit & Other Cards

"You want 21% risk free? Pay off your credit cards"¹⁴
Andrew Tobias, American journalist, author and columnist

Introduction

Credit cards are based on the principle "buy now - pay later".

Credit cards developed from credit schemes applied by individual merchants, mainly gas/petrol stations, in the 1920s in the US, to sell gas/petrol to the growing population of car owners. This would lead to the development of credit cards with Diners Club in the 1950s being a consolidation of various different cards into one card which allowed the card holder to pay different merchants using only one card.

The first widely accepted plastic charge card was issued in 1958 by American Express, and the first general-use credit card that allowed balances to be paid over time was the BankAmericard (which in 1977 changed its name to Visa), issued in 1959.

In 1966, a number of banks formed the Interbank Card Association and in 1969, the Interbank Card Association bought the rights to use "Master Charge" from the California Bank Association. It was renamed MasterCard in 1979.

Today there are over 5 billion credit or other cards, with the US the biggest market with over a billion cards outstanding.

In addition, there were 354 million debit cards in use in 2006.

Source: CreditCards.com¹⁵ and Nilson Report,¹⁶ December 2009 (through year-end 2009 and ranked by total worldwide outstandings)

Definition/Description

A credit card is a standard-size plastic card entitling the cardholder to use funds from the issuing financial institution up to the agreed limit. The cardholder may use the credit card to buy goods or services or withdraw cash from ATMs. When using the card the issuing company give the cardholder a loan which the card holder is usually expected to repay within 30 days. The credit limit is determined by the issuing card company based on the creditworthiness of the cardholder and can be lowered or raised at short notice.

A debit card or an ATM card operates in the same way as a credit card enabling the holder to buy goods and services and to withdraw cash from ATMs, however, the card will only allow transactions in so far as the linked or underlying account has a positive balance and no credit is therefore required.

A pre-paid card or stored value card does not have the credit facility feature. The value is either recorded remotely and linked to the card, or the value is stored on and accessible from the electronic chip built into the card. Stored value cards are also known as electronic purses. Pre-paid cards are usually issued in the name of the holder of the account to which the card is linked, whereas, stored value card are usually not linked to a name but like cash, are bearer and can be transferred and used by anyone holding the card.

Money Laundering/Terrorist Financing Risks

Cards may not, on the face of it at least, appear to be the primary financial product that would appeal to money launderers or those seeking to move funds on behalf of terrorist organisations but this is a perception that has started to change perhaps in reaction to forensic case analysis but also perhaps due to the fact that they were regarded as lower risk when compared to other products such as correspondent banking.

The same flexibility that forms a major feature of the "sales proposition" also potentially makes them attractive to launderers and terrorists although both groups recognise that the electronic payment framework and developed fraud detection systems make forensic evidence easier to obtain and near to "real time" intervention easier to undertake. That said, they do offer the ability to move funds across jurisdictional borders, using either an additional card which is issued to an individual in the second location or by physically sending the card together with the associated security details such as PIN information through the mail. This potential is recognised by card issuers and mirrors the activity that can often occur when cards are stolen or compromised and the fraudster attempts to put some

distance between the point of compromise and the point at which fraudulent activity is attempted.

The fact that there is such a close synergy between what a card issuer will be looking at in order to maintain a reasonable and appropriate fraud risk management framework and the things that a launderer might seek to use the card for, means that effective fraud control may also be a sound ML/TF suppressant.

Credit card fraud is a major problem, with 10% of US holders of credit cards and 7% of ATM or debit cards victims of fraud, with the average fraud being around US\$400 and estimates of the total amount of credit card fraud worldwide of US\$5.5bio. Of these frauds, 37% are counterfeit cards; 23% lost or stolen; 10% card not present (for example, giving card information to a non-legit telemarketer); 7% stolen cards during mail fraud and 4% identity-theft fraud.¹⁷

Beyond fraud, concerns have even been raised about Cards being used by terrorists, particularly suicide bombers. For example, spending undertaken in the direct period before a terrorist act may never appear on a statement prior to the event and so, in a rather macabre way, it is actually a way by which terrorists could fund their action in the short term at least. There is, however, a need for them to have been able to access the product in the first place, a process which usually requires them to have an established domicile and credit history. Recent events in the case of Al-Qaeda inspired individuals have sometimes been attempted by individuals who have only been radicalised after they have been resident and, in many cases, been working in the jurisdiction where the offence is committed and this requirement does not cause them a major problem. Another way in which card based products can be abused to launder funds is by having an additional card which is sent to someone in a second jurisdiction who withdraws funds and the bill is then settled by the primary card holder who remains in the original jurisdiction. The problem is that this can also mirror activity that is sometimes taking place for totally legitimate reasons, expatriates making funds available to their relations, for example, but most card issuers have recognised this risk and designed appropriate controls.

Equally interesting is the ever increasing use of pre-paid cards which tend to be either closed loop, where the card can only be used within a discrete set of outlets such as a shopping mall or particular company, or open-loop where access is available at any outlet supported by one of the major scheme issuers. The latter represents a more significant risk and most issuers of such products have controls to identify transaction

patterns that might indicate that the product is being abused. This can also be accompanied by controls restricting the total value of cash that can be used on the card during a set reporting period. The challenge is that these products are increasingly being used as an alternative to cash wage roll payments and are also attractive in some developing jurisdictions where they are seen as a halfway house between total cash usage and the adoption of credit based products which are difficult to price and risk model until there is sufficient operational knowledge and experience. It is stored value products that have been the primary focus for regulators and other interested parties and this has been reflected in two statements by the Wolfsburg Group. The first, dealing with credit cards,¹⁸ laid out the controls and risk assessments that it is appropriate for a financial institution to have in place and the second, on stored value cards,¹⁹ provided a detailed overview of how the products were designed and implemented as well as the associated controls. Both these publications, prepared by the Wolfsburg Group in association and conjunction with experts from other organisations, clearly outline the risks and provides a balanced assessment of what it is reasonable to expect a financial institution to be able to do.

Card based products are a data rich financial product where fraud prevention processes and procedures are well established and robust. These are supported by industry intelligence sharing and benchmarking but it does not mean that they are zero risk, rather that they continue to represent the lower end of ML/TF risk. The challenge is that they will continue to be refined and developed with an emphasis on added features, increased accessibility and an emphasis on low cost delivery. These factors mean that the attendant risk will continue to change and evolve and regular reviews will remain essential if a balanced and informed assessment of risk can continue to be made.

Credit and other card banking can generally be considered as presenting **low to moderate** inherent money laundering risks.

The main inherent money laundering risk for Cards is fraud.

Top ML Risks/Credit & Debit Card Fraud

Credit card fraud is the illegal obtaining of goods or services, or to obtain unauthorised funds from an account by using another persons credit card or any similar payment mechanism (for example, debit cards, store cards, etc.) as a fraudulent source of funds in a transaction. This can be done by creating a copy of a card, 'skimming' the details during a routine

transaction, stealing a card or intercepting it in the post and many other creative ruses. Credit card fraud is often committed in addition to identity theft. Counterfeit card fraud is undertaken using plastic cards that have been specifically produced or existing cards that have been altered. These cards are encoded with illegally obtained payment card account data in order to pay for goods and services or to withdraw cash. Card Not Present (CNP) fraud is committed using payment card account data to undertake transactions where there is no face-to-face contact between the seller and purchaser. Typically, this type of fraud is committed over the Internet, by mail order or telephone. CNP fraud is currently one of the fastest growing payment card related types of fraud. The most common examples of card fraud are the following:

Malware attacks: Malware is software that allows hackers access to the victims' computers. Undetected access allows them to steal passwords, bank information, and credit card numbers. Frequently updated anti-virus software keeps these attackers at bay.

Phishing and SMSishing: Phisher's pose as genuine businesses, such as banks or social networking sites. They send official looking e-mails and mobile text messages ("SMS") that prompt recipients to confirm passwords and account information.

Credit card skimming: Skimmers steal credit card information from legitimate transactions. Unsuspecting customers hand their credit card to a dishonest merchant, who uses a small skimmer device to read and store the credit card's number. The merchant then uses the information to purchase something, or sells the information to others.

Site cloning: Fraudsters might clone an entire website, or just the order form page of a merchant site. Victims enter all their information, including name, address, and credit card number, thinking they are making a valid purchase. They don't realise they are directing their ID to a thief.

False merchant sites: False sites easily dupe customers into providing their credit card information. They simply advertise their wares at ridiculously low prices, then request full credit card details from those who want to access the site.

Credit card generators: Using mathematical algorithms, this software imitates patterns of existing credit card numbers to create thousands of new credit card numbers. Many are actually valid numbers and expiration dates.

Investment Banking

"The reputation of a bank for integrity, generosity and thorough service is its most important asset, more important than any financial item. Moreover, the reputation of a firm is like a very delicate living organism which can be easily damaged and which has to be taken care of incessantly, being mainly a matter of human behaviour and human standards.... The basic conception of our firm has always been founded on the following principles: success from the financial and from the prestige point of view; important and self understood as it is, is not enough, what matters even more is a constructive achievement and adherence to high moral and aesthetic standards in the way in which we do our work"

Siegmund Warburg, founder of S.G Warburg & Co, acquired by UBS in 1995, from "The People's Banker"²²⁰ by Niall Ferguson

Introduction

Investment banking is described by its critics as casino banking and is in part responsible for the global financial crisis that began in 2007 and bankrupted two so called "Bulge Bracket"²²¹ firms in Lehman Brothers and Bear Stearns. If not for the intervention of governments around the world many more would have faced a similar fate. It was not the traditional investment banking businesses that were to blame, instead it was their proprietary trading activities that had come to dominate the industry, with investment banks behaving like large hedge funds.

The distinction between proprietary trading and client or relationship focussed activities was already well understood in the 1960s during Siegmund Warburg's

rise. He preferred to distinguish what he espoused as constructive as "relationship banking", with what he termed, "transaction banking" which he described as "channelling big sums of money from certain quarters which had a surplus to certain other quarters where there was a scarcity of funds ... trading in money and of moving funds". According to Warburg, transaction banking, the preference for quantity over quality, had been one of the root causes of the Wall Street Crash and the Great Depression. The lesson of history, in his eyes, was that bankers should engage in advising firms they got to know intimately, rather than in speculation. "Personally," he wrote, "I am not interested in the waves of despondency and enthusiasm. These are appropriate for people who look upon matters purely from a stock exchange point of view ... However, if we want to succeed, we must make up our mind to follow a policy of establishing new values and new procedures rather than to act mainly as traders and sellers of securities which we find relatively easy to dispose of. In other words, we must be aware that we are primarily bankers and only secondarily stock exchange traders." With many in the investment banking industry, since Warburg's day, no longer speaking of "clients", but of "counterparties" and far from eschewing conflicts of interest, boasting instead of embracing and/or managing them, investment banking had travelled far from its core traditions, though there are signs that a return to these traditions is the way back to the future at least for some in the industry. It is clear that major investment banks are reconsidering the complexity of their business models and contemplating, with some even deciding upon, a far simpler strategy in the future. This may result in a return to the non-proprietary, client-centric model that Warburg espoused and would go some way to repairing the significant reputational damage suffered by the entire banking industry as a result of the financial crisis.

Definition/Description

An investment bank is a financial institution that assists individuals, corporations and governments in raising capital by underwriting and/or acting as the client's agent in the issuance of securities. An investment bank may also assist companies involved in mergers and acquisitions, and provide ancillary services such as market making, trading of derivatives, fixed income instruments, foreign exchange, commodities, and equity securities. There are two main lines of business in investment banking, 1) Trading securities for cash or for other securities (that is, facilitating transactions, market-making), largely with other financial institutions or the promotion of securities (that is, underwriting, research, etc. for clients, such as governments, institutions and companies, often known as the "sell

side"; 2) Advising those who manage assets (through mutual funds or hedge funds or pension funds or those who represent the investing public (who consume the products and services of the sell-side in order to maximise their return on investment) or run companies and businesses, constituting the "buy side". Many firms have both buy and sell side components. Securities can include all manner of different instruments. Where once trading and investing in government securities or debt dominated the markets, today instruments representing all manner of interests include: equities, fixed income, foreign exchange and commodities including precious metals. Financial derivatives can be issued and traded on the back of the markets in these instruments, for example, options, swaps, warrants, futures, or other structured products, sometimes called plain vanilla, for example, a simple option (that is, the right but not the obligation to buy at a certain price a fixed amount of a particular security at or within a certain time frame) or an exotic derivative, or more structured financially engineered, swapped, strangled and straddled packages of various different instruments. Securities and derivatives can be issued and traded on exchange on a regulated market with central clearing and settlement or Over The Counter ("OTC") on a bilateral basis between parties, as principal or as agent for customers. The derivatives market is significant (about US\$516 trillion in 2008) and experienced rapid growth through the late 1990s and early 2000s. Much has been written about the dangers of derivatives, especially the complexity and the risks. In 1988, the then Federal Chairman, Alan Greenspan stated, "what many critics of equity derivatives fail to realise is that the markets for these instruments have become so large not because of slick sales campaigns, but because they are providing economic value to their users."²²² Former SEC Chairman, Arthur Leavitt observed in 1995 that "derivatives are something like electricity; dangerous if mishandled, but bearing the potential to do good."²²³ It is not the derivative that is dangerous it is how they are used or perhaps abused, whether they are understood and appropriate in each case. The Global Financial Crisis of 2007 was a case in point. It was sparked from the bursting of the US housing bubble which had been fuelled by sub-prime Collateralised Debt Securities/Obligations (CDSs/CDOs) that pumped so much voltage into the housing grid that the system went into meltdown. Not only did these complex derivatives provide too much liquidity into the US sub-prime housing market, those holding the securities placed too much faith in their engineers and their own intellect and the securities failed to protect holders from huge losses despite the rating agencies confirming their ratings as AAA. As usual, one investor could at least say "I told you so" and more importantly avoid huge

losses as a result. In his 2002 Berkshire Hathaway letter to shareholders, company Chairman and CEO Warren Buffett expressed his concern with derivatives, referring to them as "weapons of mass destruction," a term popularised by George W. Bush to describe nuclear arms at the time. He stated that, "Unless derivatives contracts are collateralised or guaranteed, their ultimate value also depends on the creditworthiness of the counterparties to them. In the meantime, though, before a contract is settled, the counterparties record profits and losses—often huge in amount—in their current earnings statements without so much as a penny changing hands. The range of derivatives contracts is limited only by the imagination of man (or sometimes, so it seems, madmen)."²²⁴ His derogatory comments about derivatives appear to be directed toward those that create vast leverage and are involved in counterparty risk and perhaps come from his own experiences arising out of his 1998 acquisition of General Reinsurance Corp.²²⁵

An investment bank can also be split into private and public functions with an information barrier (also known as a 'Chinese Wall'²²⁶) which separates the two to prevent information from crossing. The private areas of the bank deal with information that may not be publicly disclosed, while the public areas such as stock analysis and traders deal with public information.

"Corporate finance" including, "mergers and acquisitions" is one of the core activities of an investment bank and is within one of the most important private sides of the bank, protected by informational barriers. Examples include; arranging an Initial Public Offering (IPO), a sale or placement of a block of shares, or a rights issue for a company client or a major corporate transaction such as a sale, merger or takeover.

Investment banks will also typically offer loans and extend credit to companies in order to facilitate capital market activity or simply to assist companies with their strategic goals. Syndicated loans are those offered by a group of investment banks working together to provide funds for a single borrower and the loan may involve fixed amounts, a credit line or a combination of the two. This spreads the risk of borrower default across multiple lenders. Syndicated loans can also be used as part of a leveraged buyout to fund large corporate takeovers with primarily debt funding. Unlike commercial banks, retail banks, or private banks, investment banks do not usually take deposits from the public and in fact, in the US, they were strictly not allowed to do so. From 1933 (Glass-Steagall Act) until 1999 (Gramm-Leach-Bliley Act), the US maintained a separation between investment banking and commercial banking due to

lessons learned from the Stock Market Crash of 1929 which led to the Great Depression of the 1930s. Whilst other industrialised countries, including G8 countries, historically had not maintained such a separation, the US as well as the UK and the EU are re-introducing firewalls and regulations to ring fence investment banking activities from deposits in banks once more, as the lessons from the 2007 global financial crisis are understood.

Money Laundering/Terrorist Financing Risks

Money laundering risks are usually those of a firm's customers, with the firm's employees being tasked with preventing and detecting any related suspicious activity. However, many of the biggest risks faced by investment banks include home grown ones. Much of these risks are exacerbated where there is a culture of reckless risk taking and individualism with high personal rewards the main incentives and an inadequate supervisory or effective control environment. Similar risks posed to an investment bank from its employees can also be presented by its customers, though the money laundering is not direct and the absence of knowledge should not cause the same direct damage to the firm.

Also investment banks rarely accept cash deposits or provide personal accounts that facilitate money transmission and/or third party funding that is not related to specific underlying investment transactions and so are generally seen as lower risk from a money laundering perspective. Terrorism finance appears to warrant little concern in investment banking. Whilst there were suggestions immediately after 9/11 that Al-Qaeda may have benefited in the financial markets ahead of the Attacks on America, no evidence was found and these suggestions have since been rejected.

Source: Author

Investment banking can generally be considered as presenting **low to moderate** inherent money laundering risks, with the above being the top inherent risks facing an investment bank:

1. Rogue/Unauthorised Traders

Real risks can present themselves in the form of so called "Rogue Traders", going far beyond allowed position and trading limits and/or by employing fictitious schemes and devices which can expose the firm to excessive credit and market risks. The most recent is the case of Kweku Adeboli at UBS, (see Fraud section in Part 1, Section 1 and Criminal Cases in Part 2, Section 7 for Adeboli as well as other notorious Rogue Traders).

2. Insider Dealing by Employees

Beyond "Rogue Traders" investment banks need to be concerned with insider dealing by their employees. Investment banks are homes to significant amounts of inside information in their "Corporate Finance" departments and need to secure and protect this information, both from its own employees and from third parties who do not and should not have access to it. Whilst today there are few examples where information from behind a firm's Chinese Wall has leaked or been passed to the firm's trading side and acted upon for the benefit of the firm or for the individuals involved, there remain real reasons to be concerned that inside information is being shared more broadly and is being used by insiders, relatives and insider rings to profit illegally. For more details see Part 1, Section 1, Insider Dealing.

3. Market Manipulation by Employees

Market abuse and market manipulation are also real concerns to investment banks, particularly those ones with major trading operations. Looking out for improper schemes and malpractices remains an important task and these include the misuse of information such as front and parallel running, as well as other manipulative practices. For more details see Part 1, Section 1, Inside Information; Misuse of Information and Part 1, Section 1, Market Manipulation. Current concerns include rigging benchmarks, for details see Liber Bid Rigging Scandal in Part 2, Section 8, Enforcement Cases, but also investigations seem to have started beyond Libor and other interest rate benchmarks into precious metals and foreign exchange. In the Libor cases, illegal collusion between market participants have incurred the wrath of competition authorities in addition to that of regulators and to significant additional penalties.

4. Bribery by Employees

Whilst financial services has regularly appeared low

down relatively speaking on the lists of industries that are prone to corruption risks, the relative importance of emerging markets business to investment banks is growing as these markets and activity in these markets continue to outperform more established and developed markets. Corruption risks in relation to own deals is therefore likely to be increased and likely to increase further. Also, the use of third party intermediaries is a risk to be considered. Lavish entertainment or gifts may also be of concern. For more details on bribery and corruption see Part 1, Section 1, Bribery and Corruption and Part 2, Section 2, Sub-section 2, Intermediaries.

5. Market Abuse by Customers

Customers that indicate they could be operating a Boiler Room operation and/or other customers dealing in a manner raising concerns of market abuse, including insider dealing misuse of information and market manipulation. For more details see Part 1, Sections 1, Insider Dealing and Market Manipulation.

6. Sensitive Customers

Customers that could be involved in activity that is considered itself sensitive or controversial, for example, agreeing to manage funds from businesses such as; arms dealer companies or private military firms; businesses that make and/or distribute war materials, in particular controversial weapons (nuclear, chemical or biological or cluster munitions and anti-personnel mines) or dual use goods, businesses involved in mining and minerals, particularly if involved in so called, mountain top removal; forestry or logging businesses, particularly if involved in palm oil extraction or leading to deforestation; businesses with poor human rights records or a record of environmental damage; businesses involved in waste management; infrastructure and real estate funds. For more details see Part 1, Section 2, Sub-section 1, Money Laundering Risks Identified.

7. Customers with Material Sensitive Country Risk Exposures

Customers, in particular sensitive customers, that are based in or have material exposures to countries that have been identified as posing increased risks, for example, countries the subject of sanctions and/or embargoes, with major corruption problems and/or organised crime and terror finance/WMD proliferation concerns. This also applies to customers owned or controlled by or dealing with sovereign governments and publicly owned entities from such countries, including sovereign wealth funds and municipalities. For more details see Part 1, Section 1, Bribery & Corruption; Terrorism Finance & WMD Proliferation Finance and Part 1, Section 3, Sanctions & Embargoes.

8. Politically Exposed Persons

Customers that are either owned or controlled by, or where the beneficial owner is, a PEP. For more details see Part 1, Section 1, Bribery & Corruption and Part 1, Section 2, Sub-section 2, Politically Exposed Persons.

9. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as being connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation etc. Investment banks must screen customers, for example, against lists of known terrorists and major criminals prior to conducting business and against payment flows if to other parties. For more details see Part 1, Section 3, Sanctions & Embargoes.

10. High Frequency/Algo Trading and Dark Pools

The rise in high frequency trading and in particular algorithmic trading and trading using artificial intelligence is becoming a major part of the functioning of the securities markets and not just in equities but across many asset classes. Whilst these developments appear to provide increasing trading volumes and as a result improved market liquidity, lower trading costs, through reduction in bid ask spreads, resulting in a more efficient price discovery process which in theory should attract and encourage more investors, they also pose a threat. High frequency algorithmic trading by firms themselves and their clients could affect the stability of markets, which could provoke a serious downward spiral as happened for a time with the flash crash of May 2010, when American equity markets nosedived by almost 10% in the course of a few minutes, for example, as a result of a so called "errant algo" or by setting off sell orders en masse that take the markets quickly ever lower. The increases in liquidity provided by high frequency traders may well become illusory at times of market stress. The consequences for those involved if culpable and the damage done may be significant. Another concern is to some the unfairness in the market where high frequency traders gain an advantage over ordinary investors by putting their high powered servers right next to the exchanges data servers and so getting split millisecond advantages on the direction of the market which they use to make money, which has spawned an increase in Dark Pools off Exchange to hide from these traders, though Dark Pools are likely to become increasingly regulated and/or require to be more transparent.

Retail Banking

*"A bank is a place that will lend you money if you can prove that you don't need it."*²⁷

Bob Hope, American Comedian and Actor

Introduction

Retail banking is designed to provide individual customers with financial services for life, from college funding, to a regular chequing account, to credit and other card services, mortgages and loans, investments and insurance, to retirement trusts.

Much of the so called developed world's citizens have been able to readily access financial services, usually initially by opening an account relationship at a bank, as teenagers, expecting to hold on to their bank accounts until the day they die. This can be contrasted with many in other parts of the world where according to the World Bank,²⁸ still 2.5 billion people do not have access to banking services. With new technology, there is every reason to believe that the numbers without access to financial services will reduce significantly and at the same time, it is far from clear that banks will maintain their traditional dominance as the principal provider of retail financial services, particularly for those currently unbanked.

As banks continue to develop and offer products, to maintain the international payments system and work harder to defend their customer franchises, there is the risk that major new players emerge and replace banks as the principal customer interface and channel for tomorrow's financial services. In many places tomorrow's world is here today with mobile services taking off around the world and with many predicting the mobile phone and the mobile phone company challenging the banks in offering an alternative electronic purse and payment offering that is both competitive and compelling.

With customers being the lifeblood for retail banks, retaining customer loyalty in an environment where trust in banks is at a low level remains a challenge, though generally as the lack of trust appears to be an industry wide issue this is not translating into mass migrations of customers, and inertia seemingly also plays its part.

Definition/Description

A very large percentage of the population in developed and even developing countries that have bank accounts usually have their accounts at a retail bank. Today much of retail banking is streamlined electronically via

Automated Teller Machines (ATMs), or through virtual retail banking known as online banking. Ultimately, retail banking is designed to provide consumers with banking services for life, from college funds opened at the birth of a child to retirement trusts established to pay for old age.

Since so many people have bank accounts at retail banks and since the practice of laundering money can be a numbers game that favours the criminal, that is, the more accounts a financial institution has to monitor for money laundering and other suspicious activity the better the chances are for criminal proceeds to go undetected, retail banks can be an attractive place for money launderers. Therefore, retail banks are a popular type of financial institution for all three stages of the money laundering process, especially the first stage, the placement stage.²⁹

There are many products and services that retail banks provide to customers through brick and mortar branches, though much of retail banking is today streamlined electronically via ATMs, through virtual retail banking known as online banking, telephone banking, video banking and mobile banking.

The most basic retail banking services for individual customers include savings and checking accounts, safe deposit boxes, wire/journal services, access to wire transfer/payments services, home and car loans, certificates of deposit (CDs), retirement accounts, bill paying services, direct deposit services and debit and credit cards. For more details regarding cards, see Part 1, Section 2, Sub-section 3, Credit & Other Cards.

Although retail banking is, for the most part, mass-market driven, many retail banking products extend to small and medium sized businesses. For small businesses, the banking products include merchant and payments services, cash handling, insurance brokerage, and payroll and employee benefits services. For more details see Part 1, Section 2, Sub-section 3, Commercial Banking above.

Many large financial institutions or so called universal banks have a distinct and important "retail banking" business. Some retail banks are international corporations with numerous branches located across the globe, though most have a dominant home location. Others retail banks operate on a national level while smaller retail banks may be regional or have single branches. The following 15 banks that have some of the largest retail operations in their home countries and have grown overseas have an aggregate over 1 billion customers. Whilst more limited than banks an

alternative retail institution E-bay, for example, via its Pay Pal network has an estimated 232 million accounts albeit only 100 million are considered active.

Large (Country Champion) Banks by Customers

Bank	Home Market	Est No
Ag Bank of China	China	323mio

Money Laundering/Terrorist Financing Risks

Whilst a third of the world's population do not have access to bank accounts or financial services, and the best estimate of funds laundered in 2009 is US\$1.6 trillion³⁰ or 1.5% of global GDP, it can be safely assumed that the overwhelming amount of funds within banks and, in particular in retail banks, is of little concern from a money laundering and terrorist financing perspective.

That being said, whilst retail banks handle high volumes of cash and cheque deposits and cash withdrawals, wire transfers to other financial institutions, between accounts and other high volume activity, there remains a risk that such transactions will include the proceeds of crime or may be used to fund terror activities, noting for the latter in particular, the relatively small amounts needed to carry out acts of terror. Retail banking is often a customer's first point of entry into a bank and so establishing effective controls from the outset is imperative.

Retail Banking can generally be considered as presenting **moderate to high** inherent money laundering risks and

the following are the top inherent money laundering risks for a retail bank. For many retail banks they also combine the commercial bank and so in such cases these can be read together, but for this purpose the following relates to individual customers only.

Top ML Risks in Retail Banking

1	Customers with Cash Transactions
2	Customers with Material Sensitive Country Risk Exposures
3	Complex or Complicated Non Transparent Customers
4	Sanctioned or Other Problematic Customers
5	Credit and Loan Fraud
6	Identity Theft and Account Takeover
7	Tax Evasion
8	Credit Card and other Card Fraud
9	Bank Robbery
10	New Payment Methods

Source: Author

1. Customers with Cash Transactions

Cash deposits (including cash like, for example, cheques) can present a heightened risk for retail banks. Still banks are very aware of the risks of cash, especially large deposits and withdrawals; numerous deposits, concentration and then wiring out of the bank, including to third parties or overseas. Banks can be prone to smurfing in particular, where smaller deposits are made into various branches of the same bank to avoid the immediate detection of large value transactions.

2. Customers with Material Sensitive Country Risk Exposures

Customers, in particular sensitive customers, that are based in or have material exposures to countries that have been identified as posing increased risks, for example countries the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. For more details see Part 1 Bribery & Corruption; Terrorism finance & WMD Proliferation Finance and Part 4 Sanctions & Embargoes.

3. Complex or Complicated Non-Transparent Customers

Customers, that are unduly or excessively complex, where identification and/or due diligence is difficult to establish or carry out satisfactorily, for example

Customers operating through personal investment companies or numerous layers of holding vehicles which appear designed to hide the ultimate beneficial owner. Retail banking is a mass consumer business and as a result will generally not involve close relationship management by a named relationship manager.

Increasingly customers will interact with their bank through various channels, in person perhaps, though also perhaps not, as in some cases with telephone, online and mobile banking, the customer may not physically interact with the bank at all and so since there is no interaction with employees of the bank and their activity is rarely questioned unless the bank's monitoring systems catch the suspicious or abnormal activity, money launderers may seek to exploit such vulnerabilities.

4. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation, etc. Banks must be wary in particular to screen customers, for example against known terrorists and major criminals against lists of persons made available prior to opening of accounts and against payment flows if to other parties.

5. Credit and Loan Fraud

Customers applying for and receiving credits or other financial assistance based on misrepresented facts and figures, either directly or through company account fraud or sinks. Whilst the most obvious risks are mortgage and other credit frauds, which for more details see Fraud in Part 1, Section 1 above, and credit card fraud, which for more details see Credit & other Cards in Part 1, Section 2, Sub-section 3, credits can be used as part of a money laundering scheme beyond fraud. Whilst credits and loans result in a borrower receiving money from the bank, this product can be used as part of a money laundering scheme, with the main money laundering risk arising through the acceleration of an agreed repayment schedule, either by means of lump sum repayments, or early termination. When loans are made in one jurisdiction, and collateral is held in another, this may also indicate a heightened money laundering risk.

6. Identity Theft and Account Takeover

With around two thirds of the world's population having access to retail bank accounts, and more on the way, banks are obliged to collect and copy identification documents, verified by still more documents in order to establish that the bank customer is not only who he purports to be but also that he is not, in fact, someone

the bank either should not or does not want to deal with, this despite the fact that identification documents are not hard to come by, particularly for those professional and/or organised criminal gangs. Identity theft and account takeover are a growing problem. For more details see Part 1, Section 1, Fraud including Tax Fraud and Cybercrime.

7. Tax Evasion

Customers that are non resident for tax purposes, may use a retail account to hold even small sums undeclared for tax purposes. A bank should never assist a customer in cheating its taxes, and if it becomes aware or suspects that a customer is cheating on its taxes, then it should, where tax crimes are predicate offences to money laundering, file appropriate suspicious activity reports.

8. Credit Card and other Card Fraud

For more details see Part 1, Section 2, Sub-section 3, Credit & Other Cards.

9. Bank Robbery

Retail branches hold large quantities of cash and of course carry a risk of robbery. Since formalised branches developed, security in this field has been increasing in effectiveness and it would be fair to say that bank robberies are a lower risk compared to what they once were. However, for successful bank robberies 80% of stolen money is never recovered. With most branches having standardised layout and features, it is not difficult to see why a bank may be an attractive source of cash. For more details see Theft, Robbery & Trafficking above in Part 1, Section 1.

10. New Payment Methods

Innovation has been a constant theme driving banking throughout the ages, with the 20th century being the century which brought numerous new modern products and services and new delivery channels to customers. With the first credit and charge cards being issued in the US in the 1950s see Part 1, Section 2, Sub-section 3, Credit and other Cards and the first ATM machine being installed by Barclays Bank in London in 1967. Today there are more than 1.6 million cash machines worldwide.

The ATM³¹ was invented by John Shepherd-Barron a UK inventor who supposed that there must be a way to get at his own money in the bank at any time anywhere in the world or the UK and he hit upon the idea of a chocolate bar dispenser, but replacing chocolate with cash. He pitched the idea to Barclays, who convinced them immediately. Mr Shepherd-Barron's machine used cheques that were impregnated with carbon 14, a mildly radioactive substance. The machine

detected it, then matched the cheque against a PIN number. These cheques would soon be replaced with Plastic Cards. The machine paid out a maximum of £10 a time. The first machines were vandalised, and one that was installed in Zurich in Switzerland began to malfunction mysteriously as it was later discovered that the wires from two intersecting tramlines nearby were sparking and interfering with the mechanism. One by-product of inventing the first cash machine was the concept of the PIN number. Mr Shepherd-Barron came up with the idea when he realised that he could remember his six-figure army number, but to be safe he decided to stick with a four digit number. Despite the success of his ATM machine, Mr Shepherd-Barron believes its use in future will be very different, predicting the demise of cash in many societies and predicting along with many others that electronic purses in the form of mobile phones could soon be ubiquitous, with a swipe of a phone at till points enough for small transactions, that are today settled with cash or a credit or charge card.

Mobile phone banking is seen by many as a solution to many in the developing world who do not have access to bank services, relying on money service business and informal operations but also to many in the developed world who increasingly receive and rely on the mobile phone and its "apps" for many and varied services. The portability, reliability and usability of smart phones make them a natural product to act also as an electronic purse. They also appear likely to supplement and in some cases supplant the take up of banking by other channels, for example, telephone and internet banking the latter, still suffering from concerns over internet security, which is likely to be a problem also for mobile phones but interestingly is not perceived quite as such by customers. Since 9/11 however, the FATF and member countries have become concerned that new payment methods could be used by money launderer's and terrorist financiers to circumvent money laundering controls established for the formal financial sector and in particular those applicable to banks and other non-bank financial institutions. Nevertheless, it is clear that the implementation of controls and design features can reduce risks and vulnerabilities, for example, imposing purse limits, usage controls, and systems to detect suspicious activity contributes to mitigating these risks. Furthermore, where the use of electronic purses is limited to small value payments, the use of this product is less attractive to would-be launderers. For terrorist financing, and other financial crime, electronic money offers a more accountable, and therefore less attractive means of transferring money compared to cash, provided KYC/AML checks are required. Still most electronic money products in commercial use

today do not provide the kind of privacy or anonymity that cash provides, nor its utility. This is due to a number of factors: commercial practice, for example, dictates that most products are funded by payments from bank accounts or credit cards, and therefore can often reveal the identity of the customer at the outset, or at least such customers have been taken on and screened. Similarly, use of these products often leaves an electronic trail that can help locate, if not identify, the user of a particular product. As issuers of electronic money usually occupy the position of intermediary in the payment process, situated between two financial or credit institutions, they are often able to provide additional transaction information to law enforcement investigations that complements identity data provided by other financial institutions. This may be equally or more valuable in the chain of evidence than a repetition of the verification of identity process, as it can yield valuable information to assist law enforcement in that event. Fraud prevention and consumer protection concerns led to the placement of transaction, turnover, and purse limits on products, limiting the risk to both issuer and consumer. These limits act to restrict the usefulness of the product for money laundering, and make unusual transactions more detectable.

Of course where controls or missing or design features apply to increase the risks, this is possible, for example, the higher the value and frequency of transactions, and the higher the purse limit, the greater the risk: The €15,000 threshold for occasional transactions provided in the Regulations may in this context provide a convenient comparator when assessing such risk; Frequent cross-border transactions, unless within a single scheme, can give rise to problems with information sharing; Dependence on counterparty systems increases the risk; Some merchant activity is particularly susceptible to money laundering, for example, betting and gaming offer a number of opportunities either with or without the collusion of the merchant; and money service businesses are considered as susceptible to exploitation for money laundering and terrorist financing; Funding of purses using cash offers little or no audit trail and hence presents a higher risk of money laundering; The non face-to-face nature of many products also gives rise to increased risk; The ability of consumers to hold multiple purses (for example open multiple accounts or purchase a number of cards) without verification of identity increases the risk; Redemptions at ATMs, as well as any allowances for the payment of refunds in cash for purchases made using electronic money will also increase the risk; The ability of non-verified third parties to use the product increases the risk; and The technology adopted by the product may give rise to specific risks that should be assessed.

Wealth Management / Private Banking

"What makes private banking appealing to legitimate customers also makes it particularly inviting to criminals.... the Subcommittee found that in several cases criminals used private banking services to move huge sums of money with the assistance of private bankers....In essence, private bankers act like a concierge at an expensive hotel."

US Senator Susan Collins - 1999 Permanent Subcommittee on Investigations' "Private Banking and Money Laundering: A Case Study of Opportunities and Vulnerabilities"³²

Historically, private banking developed in Europe. Some banks in Europe are known for managing assets of some royal families.

The assets of Princely Family of Liechtenstein is managed by LGT Bank (founded in 1920). The assets of Dutch Royal Family is managed by MeesPierson (founded in 1720). The assets of British Royal Family is managed by Coutts (founded in 1692). Some American banks that specialise in private banking date back to 19th century, such as US Trust (founded in 1812) and Northern Trust (founded in 1889).

The country notable most for private banking is Switzerland, which remains the largest offshore centre, with about 27% (US\$2.0 trillion) of global offshore wealth in 2009, according to Boston Consulting Group.³³

According to the 15th annual World Wealth Report, by Merrill Lynch Global Wealth Management and Capgemini 2011 the population of High Net Worth Individuals ("HNWIs") increased to 10.9 million and HNWI financial wealth reached US\$42.7 trillion.³⁴

The US is still home to the single largest high net worth individuals' segment in the world, with its 3.1 million HNWIs accounting for 28.6% of the global HNWI population.

The global HNWI population remained highly concentrated in the US, Japan and Germany, which together accounted for 53.0% of the world's HNWIs. Asia-Pacific HNWIs' wealth was second as far as regions were concerned with US\$10.8 trillion, exceeding Europe's HNWI wealth of US\$10.2 trillion.

Top 20 Largest WM/PBs by Assets			
Rank	Bank	Country	(US\$bio)

Source: Scorpio Private Banking Benchmark 2013³⁵

Definition/Description

Private Banking is the provision of banking and brokerage and investment services in a closely managed relationship to HNW clients.

Private banking targets only the very wealthiest clients or HNWIs, broadly speaking, those with more than around US\$1mio in investable assets, excluding primary residence, collectibles, consumables and consumer durables. Ultra-HNWIs are defined as those having investable assets of US\$30mio or more, again excluding primary residence, collectibles, consumables and consumer durables. Wealth management, by contrast, targets clients with assets in excess of US\$100,000, that is, affluent as well as HNW clients.

Such services will include bespoke product features tailored to a client's particular needs and may be provided from a wide range of facilities available to the client including: current account banking, high value transactions, use of sophisticated products, non-standard investment solutions, business conducted

across different jurisdictions, offshore and overseas companies, trusts or personal investment vehicles.

According to the S.312 of the US Patriot Act,³⁶ a "private banking account" is an account (or any combination of accounts) maintained at a bank that satisfies all three of the following criteria: (i) requires a minimum aggregate deposit of funds or other assets of not less than US\$1mio; (ii) is established on behalf of or for the benefit of one or more non-US persons who are direct or beneficial owners of the account; and (iii) is assigned to, or is administered by, in whole or in part, an officer, employee, or agent of a bank acting as a liaison between a financial institution covered by the regulation and the direct or beneficial owner of the account.

Private banks and wealth managers focus on a client's need and risk appetite, and tailoring the solution accordingly. Most modern private banks follow an open architecture product platform, offering suitable third party best in breed products. Still proprietary products and services are also offered, though increasingly it is the service the bank offers in sifting through the investment opportunities available and tailoring these to particular individual circumstances and preferences that marks the more successful operations. The offering will also include access to investment opportunities across all major asset classes and geographies and to reliable execution. Of course private banking customers will pay for these services, and the charges vary. There are private banks that follow the transactional model where the client is charged per transaction and others where advisory fees are charged. There are other private banks that follow a hybrid model. In this model, the bank charges a fixed fee for certain products and an advisory fee for the rest. The most recent industry trend is towards the advisory fee model, because margins on commissions may go down in the future.

Money Laundering/Terrorist Financing Risks

Whilst it was at one time thought that there were few money laundering risks in the private banking sector because of the personal contact between relationship managers and their wealthy customers, it was the release of a report and hearings by the US Senate Permanent Sub Committee on Investigations: 'Private Banking and Money Laundering: A Case study of Opportunities and Vulnerabilities 1999', that revealed major risks and concerns. Since that time, much has changed in the regulation and operation of private banking but the facts and concerns raised in that report remain important and in particular the case histories relating to amongst others *Abacha*, *Bongo*, *Salinas* and *Zardari* and their relationships with Citibank. For details see Part 2,

Section 7, Criminal Cases.

Money laundering risks can vary significantly between different private banks depending on their business models. Some private banks operating at the lower end of the risk 'spectrum' had businesses that was closer to that seen in a standard retail and investment businesses environment. At the higher end of the risk spectrum, firms provided services to a more internationally diverse client base, some of whom were located in high-risk jurisdictions, through advisors based across the globe. Customers of these firms were more likely to have non-standard financial requirements and manage their affairs through complex structures, a significant risk factor in itself.

According to FSA Peer review³⁷ - the following are the risk factors that are likely to increase the risk of money laundering within private banking businesses: an international customer base which includes people or organisations from jurisdictions with: a) relatively weak legal structures and/or economies, from which residents are likely to 'shelter' funds overseas; b) a reputation for providing secretive or discrete company and trust formation and administration services; and c) a poor record on the implementation of measures to prevent and enforce against financial crime, including corruption.

UK JMLSG Guidance Notes³⁸ state that money launderers are attracted to private banking by 'the availability of complex products and services that operate internationally within a reputable and secure wealth management environment that is familiar with high value transactions'. The following are examples cited by the JMLSG Guidance as factors contributing to the increased vulnerability of wealth management: a. wealthy and powerful clients, who may be reluctant or unwilling to provide adequate documents, details and explanations; b. multiple and complex accounts – within the same firm or group, or with different firms; c. cultures of confidentiality; d. concealment , for example, of beneficial ownership through offshore trusts; and e. countries with statutory banking secrecy in certain jurisdictions. f. movement of funds – often high value and rapid transfers. g. credit – the extension of credit to clients who use their assets as collateral also poses a money laundering risk unless the lender is satisfied that the origin and source of the underlying asset is legitimate.

Private banking services can be vulnerable to money laundering schemes and past money laundering prosecutions have demonstrated that vulnerability. The 1999 Permanent Sub-committee on Investigations

"Private Banking and Money Laundering: A Case Study of Opportunities and Vulnerabilities" outlined, in part, the following vulnerabilities to money laundering: a) private bankers as client advocates; b) powerful clients including politically exposed persons, industrialists, and entertainers; c) culture of confidentiality and the use of secrecy jurisdictions or shell companies; d) private banking culture of lax internal controls; e) competitive nature of the business; and f) significant profit potential for the bank.

Whilst private banking, particularly international private banking, is vulnerable to money laundering, the close relationship that private banks aim to have with their clients, and the bespoke requirements that many private banking clients have, should allow private banks to develop a very good understanding of their clients and the reasons for their clients' transaction activity. With this knowledge, the risks inherent in the business can be mitigated. In order to mitigate the risks banks should establish a risk profile for each customer to be used in prioritising oversight resources and for ongoing monitoring of relationship activities. The following factors should be considered when identifying risk characteristics of private banking customers: nature of the customer's wealth and the customer's business: (i) the source of the customer's wealth; the nature of the customer's business; and the extent to which the customer's business history presents an increased risk for money laundering and terrorist financing. This factor should be considered for private banking accounts opened for PEPs; (ii) purpose and anticipated activity: the size, purpose, types of accounts, products and services involved in the relationship, and the anticipated activity of the account; (iii) relationship: The nature and duration of the bank's relationship (including relationships with affiliates) with the private banking customer; (iv) customer's corporate structure: Type of corporate structure (for example, IBCs, shell companies (domestic or foreign), or PICs); (v) geographic location and jurisdiction: the geographic location of the private banking customer's domicile and business (domestic or foreign); the review should consider the extent to which the relevant jurisdiction is internationally recognised as presenting a greater risk for money laundering or, conversely, is considered to have robust AML standards; and (vi) Public information: information known or reasonably available to the bank about the private banking customer. The scope and depth of this review should depend on the nature of this relationship and the risks involved.

Wealth management/private banking can generally be considered as presenting **moderate to high** inherent money laundering risks and the following are the top

inherent money laundering risks for a wealth manager/private bank.

Top ML Risks in WM/PB	
1	Customers with Cash Transactions
2	Customers with Cash Businesses
3	Customers with Sensitive Businesses
4	Customers with Material Sensitive Country risk exposures
5	Complex or Complicated Non-Transparent Customers
6	Politically Exposed Persons
7	Sanctioned or Other Problematic Customers
8	Fraud including Market Abuse
9	Tax Evasion
10	Employees

Source: Author

1. Customers with Cash Transactions

Cash deposits (including cash like, for example cheques), particularly large cash deposits but also withdrawals can present a heightened risk for private banks. Though banks are very aware of the risks of cash, especially large deposits and withdrawals; numerous deposits, concentration and then wiring out of the bank, including to third parties or overseas.

2. Customers with Cash Businesses

Customers that have businesses dealing in cash in large amounts, high value and/or with a large number of transactions are vulnerable to being used by money launderers as a vehicle to convert and launder crime proceeds. There are few high value and/or retail businesses that could not be used though a few are considered particularly vulnerable including; high value goods dealers, for example, real estate agents; art dealers including (auctioneers); precious metals and stones dealers (including jewellers); car, plane, yacht dealers; watch dealers, equine or other high bred animal dealers; and cash intensive businesses including; retail outlets such as garages, restaurants, ice cream parlours, clubs (including strip bars) and bars, golf clubs, bowling alleys, private ATM companies, sauna and massage parlours and laundromats. Customers owning such businesses may further wish to launder or invest criminal proceeds. For more details on some of these businesses see Part 2, Section 2, Sub-section 2, Cash-Intensive Businesses, High Value Goods Dealers, Real Estate Dealers and Precious Metals and Stones Dealers.

3. Customers with Sensitive Businesses

Customers involved in arms dealing or in private military firms; customers involved in making and/or distributing war materials or dual use goods may present additional risks. Customers involved in mining and minerals, particularly if involved in so called, mountain top removal, forestry or logging businesses, particularly if involved in palm oil extraction leading to deforestation; businesses with poor human rights records or a record of environmental damage; Customers involved in waste management and scrap metal dealers and businesses that have been identified as posing increased corruption risks themselves, particularly when combined with increased country risks, including Intermediaries as set out in 3. below. For more details see Part 2, Section 1 Money Laundering Risks Identified.

4. Customers with Material Sensitive Country Risk Exposures

Customers, in particular sensitive customers, that are based in or have material exposures to countries that have been identified as posing increased risks, for example, countries the subject of sanctions and/or embargoes, with major corruption problems, organised crime and terror finance/WMD proliferation concerns. For more details see Part 1, Bribery & Corruption; Terrorism Finance & WMD Proliferation Finance and Part 3, Sanctions & Embargoes.

5. Complex or Complicated Non-Transparent Customers

Customers, that are unduly or excessively complex, where identification and/or due diligence is difficult to establish or carry out satisfactorily, for example customers operating through personal investment companies or numerous layers of holding vehicles which appear designed to hide the ultimate beneficial owner. For more details see Part 1, Section 2, Sub-section 2, Gatekeepers. Wealth management/private banking is not a mass consumer business, quite the opposite and should involve a close relationship with a named relationship manager where complexity is not uncommon in customer structures, though in any event the relationship manager must understand both the structure and the owners and controllers of the funds. If safe-deposit facilities are offered these should only be maintained for existing customers.

6. Politically Exposed Persons

Customers who are PEPs. For more details see part 1 Bribery and Corruption and Part 2, Section 2, Sub-section 2, Politically Exposed Persons.

7. Sanctioned or Otherwise Problematic Customers

Customers that are either subject to an applicable sanctions listing, or are otherwise identified by credible sources as may be connected and/or involved in criminal activity, including corruption, terrorism finance, WMD proliferation etc. Wealth managers/private bankers must be wary in particular to screen customers, for example against known terrorists and major criminals against lists of persons made available prior to opening of accounts and against payment flows if to other parties. For more details see Part 1, Section 3, Sanctions & Embargoes.

8. Fraud including Market Abuse

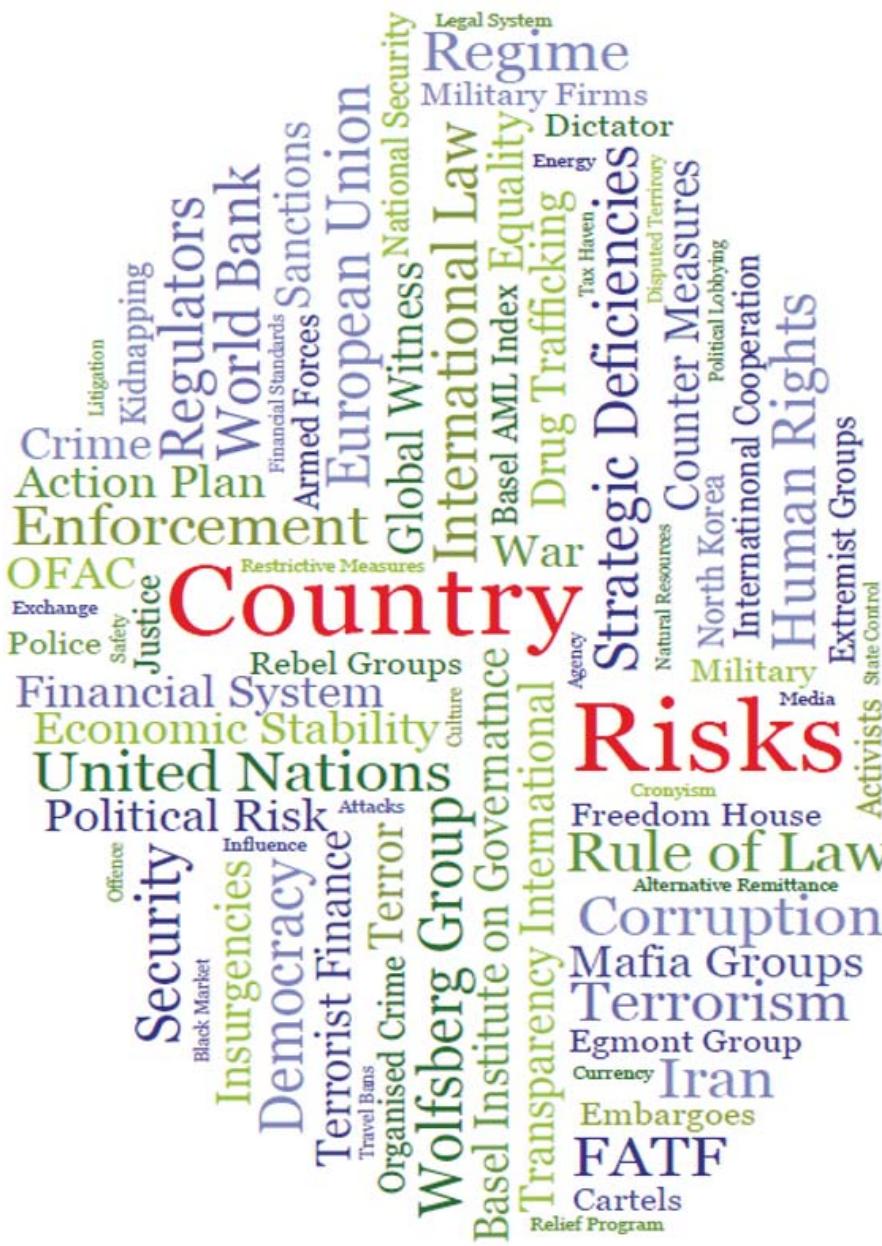

Customers that indicate they could be operating a Boiler Room operation and/or other customers dealing in a manner raising concerns of market abuse, including insider dealing misuse of information and market manipulation. Customers that are themselves insiders may present risks in some circumstances. For more details see Part 1, Section 1, Fraud; Insider Dealing and Market Manipulation.

9. Tax Evasion

Customers that are non resident for tax purposes, may use a private banking account to invest sums undclared for tax purposes and use the services of the brokerage to hide these investments. A bank should never assist a customer in tax evasion, and if it becomes aware or suspects that a customer is evading taxes, then it should, where tax crimes are predicate offences to money laundering, file appropriate suspicious activity reports.

10. Employees

Private banks may find that some of their money laundering risks are actually quite close to home. These include insider dealing by client advisers, through relationships with customers who may be themselves "Insiders", or as a result of working in a universal bank with an investment bank and getting unauthorised access to information or being tipped off or through other outside contacts; for misuse or interaction through front and/or parallel trading in connection with large customer orders. Also a client adviser may exceed his authority with respect to customer activity and/or divert customer assets for their own benefit whether to make personal gain or to cover earlier undisclosed losses.

Country Risks

Methodology & Sources

One of the most important money laundering risk factors to be considered is country risk, particularly with respect to a customer's exposure to a particular country where money laundering risk is considered problematic, material or increased. Whilst there is no universally accepted list of increased risk countries from a money laundering or financing of terrorism perspective and moreover where there is no accepted methodology, there are growing commonalities in modalities and similarities in outcomes amongst many financial institutions. First the FATF has listed some countries as recently as February 2013 as presenting increased risks. Additionally a number of these countries as well as some others are subject to various forms and levels of sanctions and embargoes from the UN or national governments and many others are the subject of numerous ratings that can be useful to evaluate respective and relative risks.

Nevertheless, whilst useful, these country commentaries apply to a limited number of countries. Fortunately there are a number of sources that can be used to cover many, if not most countries in the world, though in each case they are focussed on a particular area, for example, corruption or drug trafficking, and so combining these sources may make the most sense. In addition to particular financial crime risks, it is widely believed that the political and economic stability of a country, its record on Human Rights and on the Rule of Law are good proxies to base any financial crime country risk model on.

At UBS we have long since developed and continue to improve a methodology which incorporates many of the direct money laundering and indirect political and economic risks into a comprehensive Country Risk Methodology but this is not the only model, in fact many financial institutions have their own model. The Basel Institute on Governance recently published its own thoughts on country risk which is also available for financial institutions to use.

The following sections contain more specific information from FATF, identifies countries that are subject to sanctions and embargoes, and other credible and useful sources of information for use in assessing country risk.

Financial Action Task Force

High-Risk and Non-Cooperative Jurisdictions

The principal and initial objective of the FATF Non-Cooperative Countries and Territories ("NCCT") initia-

tive was to reduce the vulnerability of the financial system to money laundering by ensuring that all financial centres adopt and implement measures for the prevention, detection and punishment of money laundering according to internationally recognised standards. The FATF initially designated countries as "non-co-operative in the global fight against money laundering", named NCCTs. The FATF recommended that financial institutions give special attention to transactions involving the NCCTs, in accordance with the former Recommendation 21.

In February 2000, the FATF defined the basic procedure for reviewing countries and territories as well as 25 NCCT criteria against which relevant laws, regulations and other relevant information were analysed. In 2000 and 2001 47 countries or territories were examined of which 15 were listed as NCCTs in 2000 (Bahamas, Cayman Islands, Cook Islands, Dominica, Israel, Lebanon, Liechtenstein, Marshall Islands, Nauru, Niue, Panama, Philippines, Russia, St. Kitts and Nevis, St. Vincent and the Grenadines) and subsequently 8 in 2001 (Egypt, Grenada, Guatemala, Hungary, Indonesia, Myanmar, Nigeria, and Ukraine). The FATF did not review any new jurisdictions since 2001 in the framework of the NCCT initiative. As of October 2006, there have been no NCCTs in the context of the NCCT initiative with Myanmar being the country which was removed last from the NCCT list.

In order to protect the international financial system from money laundering and financing of terrorism risks and to encourage greater compliance with these FATF recommendations, the FATF identified jurisdictions that have strategic deficiencies and works with them to address those deficiencies that pose a risk to the international finance system.

Following the FATF International Co-Operation Review Group (ICRG) review, jurisdictions are publicly identified in one of two FATF public documents that are issued three times a year. The first public document, named "FATF's Public Statement", the most recent being issued in February 2013, identifies (i) jurisdictions that have strategic anti-money laundering and (ii) counter financing of terrorism deficiencies and to which counter-measures apply and jurisdictions with strategic anti-money laundering and counter financing of terrorism deficiencies that have not made sufficient progress in addressing the deficiencies or have not committed to an action plan developed with the FATF to address the deficiencies. The second FATF public document, also issued in February 2013 named "Improving Global AML/CFT Compliance: On-going Process" identifies jurisdictions with strategic anti-money laundering and

counter financing of terrorism deficiencies that have provided a high-level political commitment to address the deficiencies through implementation of an action plan developed with the FATF.

Public Statement February 2013¹

FATF continues to publicly name and shame two countries as presenting the most risks and calls on its members and other jurisdictions to apply counter-measures to protect the international financial system from the on-going and substantial money laundering and terrorist financing risks emanating from these jurisdictions.

Countries Where Counter Measures are Required

Iran	North Korea
------	-------------

Source: FATF (as of February 2013)

In the next worst category FATF in February 2013 has named and shamed a further 13 countries as having strategic AML/CFT deficiencies but stopped short of calling for outright counter-measures.

FATF announced that Bolivia, Cuba, Sri Lanka and Thailand have each provided FATF with commitments and action plans and have been moved to the next level status below. FATF accepted Turkey had made improvements and agreed it was not necessary to suspend Turkey's membership. Still Turkey stays on this former list.

Countries with Strategic AML/CFT Deficiencies

Ecuador	São Tomé & Príncipe
Ethiopia	Syria
Indonesia	Tanzania
Kenya	Turkey*
Myanmar	Vietnam
Nigeria	Yemen
Pakistan	

Source: FATF (as of February 2013)

Public Statement February 2013

FATF also published a third list of 24 countries in February 2013 which whilst strategic deficiencies exist have committed to fix these. Of these, Morocco and Tajikistan are highlighted as both making insufficient progress and as such being placed on the watch for a downgrade. Due to their progress, both Ghana and Venezuela are removed from the list.

Jurisdictions - with Weaknesses but Agreed Action Plans

Afghanistan	Mongolia
Albania	Morocco
Algeria	Namibia
Angola	Nepal
Antigua & Barbuda	Nicaragua
Argentina	Philippines
Bangladesh	Sri Lanka
Brunei Darussalam	Sudan
Cambodia	Tajikistan
Cuba	Thailand
Kuwait	Zimbabwe
Kyrgyzstan	

Source: FATF (as of February 2013)

See also Breaking News below at the end of this Book.

Sanctioned Countries

Whilst the imposition of sanctions and embargoes has long been used as a political tool, its use appears to be on the increase with over 30 countries subject to some form of formal sanction either from the UN, US, EU, Switzerland, Australia, New Zealand, the Arab League or Israel. The most important are as follows:

United Nations

Under Chapter VII of the Charter, the UN² can take enforcement measures to maintain or restore international peace and security. Such measures range from economic and/or other sanctions not involving the use of armed force to international military action. The range of sanctions has included comprehensive economic and trade sanctions and/or more targeted measures such as arms embargoes, travel bans, financial or diplomatic restrictions. Sanctions resolutions have been enforced against Somalia and Eritrea, concerning Al-Qaeda and associated individuals and entities, Liberia, the Democratic Republic of Congo, Iraq and Kuwait (senior officials of the former Iraqi regime and their immediate family members, including entities owned or controlled by them or by persons acting on their behalf), Côte D'Ivoire, Sudan, concerning the terrorist bombing in Beirut, Lebanon that killed former Lebanese Prime Minister Rafiq Hariri and 22 others, Democratic People's Republic of Korea, Islamic Republic of Iran, Libya, concerning any individuals, groups, undertakings and entities associated with the Taliban in constituting a threat to the peace, stability and security of Afghanistan, and Guinea-Bissau.

European Union (EU)

Within the framework of the Common Foreign and Security Policy (CFSP), the EU applies restrictive measures in pursuit of the specific CFSP objectives set out in Article 11 of the Treaty on European Union.³

Sanctions or restrictive measures have been frequently imposed by the EU in recent years, either on an autonomous EU basis or implementing binding resolutions of the Security Council of the UN.

Sanctions are an instrument of a diplomatic or economic nature which seek to bring about a change in activities or policies such as violations of international law or human rights, or policies that do not respect the rule of law or democratic principles.

Restrictive measures in force include:⁴ Afghanistan, Al-Qaeda and other terrorist groups (foreign terrorist organisations), Belarus, Bosnia and Herzegovina, Burma, China, Democratic Republic of Congo, Côte D'Ivoire, Egypt, Eritrea, Republic of Guinea (Conakry), Guinea-Bissau, Haiti, Iran, Iraq, Democratic People's Republic of Korea (North Korea), Lebanon, Liberia, Libya, Moldova, Myanmar (Burma), Serbia and Montenegro, Somalia, South Sudan, Sudan, Syria, Tunisia, US and Zimbabwe.

US/OFAC

The Office of Foreign Assets Control (OFAC) administers a number of different financial country-specific (and non-country specific) sanctions programmes. The sanctions can be either comprehensive or selective, using the blocking of assets and trade restrictions to accomplish foreign policy and national security goals. Current programmes include Balkans, Belarus, Burma, Ivory Coast, Counter Narcotics Trafficking, Counter Terrorism, Cuba, Democratic Republic of Congo, Iran, Iraq, Lebanon, former Liberian Regime of Charles Taylor, Libya, Non-Proliferation, North Korea, Rough Diamond Trade Controls, Somalia, Sudan, Syria, transnational criminal organisations, Yemen, and Zimbabwe.

As part of its enforcement efforts, OFAC publishes a list of individuals and companies owned or controlled by, or acting for or on behalf of, targeted countries. It also lists individuals, groups, and entities, such as terrorists and narcotics traffickers designated under programmes that are not country-specific. Collectively, such individuals and companies are called "Specially Designated Nationals" (SDNs). Their assets are blocked and US persons are generally prohibited from dealing with them.

Switzerland/SECO

Within the framework of the Swiss Sanctions and Embargo law (Article 1) Switzerland applies restrictive measures in adherence to public international law, in particular observation of human rights, in alignment with the UN, the Organisation for Security and Cooperation in Europe (OSCE), or the most important

trade partners of Switzerland. Current measures⁵ apply mostly to persons in Iraq, former Republic of Yugoslavia, Liberia, Myanmar, Zimbabwe, Côte D'Ivoire, Sudan, Democratic Republic of Congo, terrorist bombing in Beirut, Lebanon that killed former Lebanese Prime Minister Rafiq Hariri and 22 others, Belarus, Democratic People's Republic of Korea (North Korea), Lebanon, Iran, Somalia, Guinea, Eritrea, Libya, Syria, and Guinea-Bissau.

Others

There are a number of additional notable sanctions issued by important parties, including by the OSCE that have designated Armenia, by Australia and New Zealand who have designated Fiji, by the Arab League against Israel and by Israel against the Palestinian territories.

For more detailed information on Sanctions and Embargoes including details about Country Programmes see Part 1, Section 3, Sanctions & Embargoes below.

Wolfsberg Group

Within its aim to develop financial services industry standards, and related products, for KYC, anti-money laundering and counter terrorist financing policies, the Wolfsberg Group dedicated itself to country risk on numerous occasions. In 2006, the Wolfsberg Group published guidance on a Risk Based Approach for Managing Money Laundering Risks⁶ where Country Risk was one of the risk criteria, which may be modified by risk variables, to measure money laundering risks. As referenced in this Wolfsberg statement: *"Country risk [...] provides useful information as to potential money laundering risks. There is no universally agreed definition by either government or institutions that prescribes whether a particular country represents a higher risk. Factors that may result in a determination that a country poses a higher risk include:*

- Countries subject to sanctions, embargoes or similar measures issued by, for example, the UN. In addition, in some circumstances, countries subject to sanctions or measures similar to those issued by bodies such as the UN, but which may not be universally recognised, may be given credence by an institution because of the standing of the issuer and the nature of the measures.

- Countries identified by FATF as non-cooperative in the fight against money laundering or identified by credible sources as lacking appropriate money laundering laws and regulations.

- Countries identified by credible sources as providing funding or support for terrorist activities. (while, as stated below, a risk based approach to identifying terrorist funding in financial institutions is impracticable, considering those countries that support terrorist activities as an

evaluating factor for determining country or geography risk may be appropriate.)

- Countries identified by credible sources as having significant level of corruption, or other criminal activities."

Basel Institute of Governance

The Basel AML Index⁷ is an example of a country risk ranking from the Basel Institute of Governance which measures the risk of serious crimes such as money laundering and financing of terrorism as well as other relevant aspects such as financial standards and public transparency.

The Basel AML Index is offered in a public and an expert edition. The public edition is free and accessible online. The expert edition includes extensive additional functionalities (for example, an overall score with sub-indicators and sanctions lists, more comprehensive list with particular country ratings, a data file download option, updates at regular intervals upon data availability and provision of expert advice and tailor-made solutions) is available for an annual fee.

The Basel AML Index uses a composite methodology sourced through publicly available third party data.

The data aggregated in the index to assess a country's overall risk consists of a composition of fifteen variables dealing with relevant regulations combating money laundering and countering terrorist finance, financial standards, transparency and disclosure, and political risks.

The overall risk of a country is expressed in a score which is based on the 15 variables and a weighting scheme pre-defined through a qualitative expert assessment.

The 15 variables or indicators are grouped in the following five categories. Each of the indicators which have been normalized into a zero (low risk) to ten (high risk) scale and categories (indicated in parentheses below) have their own weighting:

Basel AML Index - Sources and Weightings	
Money Laundering / Terrorist Financing Risk (65%)	<ul style="list-style-type: none"> – FATF Recommendations on Money Laundering and Terrorist Financing – Tax Justice Network (TJN) – Financial Secrecy Index – US International Narcotics Control Strategy Report (INCSR) Volume II on Money Laundering
Corruption Risk (10%)	<ul style="list-style-type: none"> – Transparency International Corruption Perceptions Index (TI CPI)
Financial Transparency and Standards (15%)	<ul style="list-style-type: none"> – World Bank Doing Business Ranking – Business Extent of Disclosure Index – World Economic Forum – Global Competitiveness Report (WEF GCR) – Strength of Auditing and Reporting (scores selected from the Executive Opinion Survey) – World Economic Forum – Global Competitiveness Report (WEF GCR) – Regulations of Securities (scores selected from the Executive Opinion Survey) – World Bank – IDA Resource Allocation Index (IRAI) – Financial Sector (category selected)
Public Transparency and Accountability (5%)	<ul style="list-style-type: none"> – International IDEA Political Finance Database – International Budget Partnership (IBP) - Open Budget Index – World Bank – IDA Resource Allocation Index (IRAI) – Transparency, Accounting and Corruption (category selected)
Political and Legal Risk (5%)	<ul style="list-style-type: none"> – Euromoney – Political Risk – Freedom House – Freedom in the World & Press Freedom Index – World Economic Forum – Global Competitiveness Report (WEF GCR) – Institutional Strength (scores selected from the Executive Opinion Survey) – Bertelsmann Stiftung Transformation Index (BTI) – Rule of Law scores

Source: Basel Institute of Governance

Additional Country Sources

Beyond FATF UBS own methodology and that of the Basel Institute on Governance ("BIG") the following (some of which are included in the UBS and/or BIG methodologies) are interesting resources for country risk assessments.

Bertelsmann Stiftung's Transformation Index (BTI)⁸

The Bertelsmann Stiftung's Transformation Index (BTI) analyses and evaluates the quality of democracy, market economy and political management in 128 developing and transition countries. It measures successes and setbacks on the path toward a democracy based on the rule of law and a market economy flanked by socio-political safeguards. Within this framework, the BTI publishes two rankings, the Status Index and the Management Index.

In-depth country reports provide the qualitative data used to assess these countries' transformation status and challenges, and to evaluate the ability of policymakers to carry out consistent and targeted reforms. The BTI is the first cross-national comparative index that uses self-collected data to measure the quality of governance and provide a comprehensive analysis of countries' policymaking success during processes of transition.

The Status Index ranks the countries according to their state of democracy and market economy as of spring 2011. The Management Index ranks the countries according to their leadership's political management performance between 2009 and 2011.

Control Risks – Risk Module including Political Operational, Security, and Terrorism Rating⁹

Control risks provide a number of risk ratings that can be considered useful including:

Political Rating - Political risk evaluates the likelihood of state or non-state political actors negatively affecting business operations in a country through regime instability or direct/indirect interference.

Operational Rating - Operational risk evaluates the influence of societal and structural factors on business activity in a country, and the likelihood of state and non-state actors either facilitating or impeding efficient business operations.

Security Rating - Security risk evaluates the likelihood of state or non-state actors engaging in actions that harm the financial, physical and human assets of a company, and the extent to which the state is willing and able to protect those assets.

Terrorism Rating - Terrorism risk evaluates the likelihood that acts of terrorism directly or indirectly affect business operations in a country.

Egmont Group¹⁰

The Egmont Group is an association of governmental Financial Intelligence Units (FIUs) who meet regularly to find ways to co-operate especially in the areas of information exchange, training and the sharing of expertise in relation to money laundering and the financing of terrorism. It is named after the Egmont Arenberg Palace in Brussels where a first meeting of

FIUs was held in 1995. Membership is open to national FIUs but is subject to conditions and compliance with set criteria. Membership of Egmont should be seen as a positive signal towards a member country.

Euromoney Country Risk Rating¹¹

Euromoney's Country Risk Rating evaluates the investment risk of a country, such as risk of default on a bond, risk of losing direct investment, risk of global business relations etc., by taking a qualitative model, which seeks an expert opinion on risk variables within a country (70% weighting) and combining it with three basic quantitative values (30% weighting). Factors included in the ranking of countries by risk: political risk, economic performance/projections, structural assessment, debt indicators, credit ratings, access to bank finance, and access to capital markets. The Euromoney Political Risk Rating measures the risk of non-payment or non-servicing of payment for goods or services, loans, trade-related finance and dividends, and the non-repatriation of capital.

EU - Common Understanding of the Procedure on Criteria for the Recognition of Third Countries' Equivalence agreed by Member States¹²

Third countries meeting EU anti-money laundering and counter financing of terrorism equivalence standards are regularly identified in order to apply some of the EU's 3rd AML Directive's provisions on, for example, simplified due diligence. In the context of this obligation and in order to coordinate their approach on equivalence, member states have agreed a list of equivalent third countries. The list, which is regularly assessed includes currently: Australia, Brazil, Canada, Hong Kong, India, Japan, South Korea, Mexico, Singapore, Switzerland, South Africa, and the US though to be effective member states should also adopt the list which, for example, France, Italy and Germany have done, UK effectively also, whilst Luxembourg has but requires more and Ireland has but also adds extra states too. It should be noted that future EU proposals (EU draft 4th Money Laundering Directive) will no longer use equivalent lists for third countries, though EU countries only will be assured equivalent. Beyond the EU, other states currently identify other so-called "Equivalent Countries", for example, Hong Kong deems all FATF members as "equivalent"; A number of offshore centres like Jersey, Guernsey, Isle of Man and the Cayman Islands have also adopted the EU list as well as each other (to be verified). States that have adopted no list or identified any countries include Australia, Japan, Singapore, Switzerland, and the US.

Freedom House - Freedom in the World¹³

Freedom in the World, Freedom House's flagship publication, is the standard setting comparative assessment of global political rights and civil liberties. Published annually since 1972, the survey ratings and narrative reports on 195 countries and 14 related and disputed territories are used by policymakers, the media, international corporations, civic activists, and human

rights defenders to monitor trends in democracy and track improvements and setbacks in freedom worldwide. The Freedom in the World data and reports are available in their entirety on the Freedom House website.

OECD: International Tax Standards¹⁴

The Global Forum on Transparency and Exchange of Information for Tax Purposes met in 2011 and adopted a report delivered to the G20 on the progress it has made in ensuring the implementation of the international standard in tax cooperation. A progress report of 18 May 2012 indicated that all jurisdictions surveyed by the Global Forum had fully committed to the most recent internationally agreed tax standard. Two countries, Nauru and Guatemala, had in principle committed themselves to the internationally agreed tax standard, but had not yet substantially implemented it.

Transparency International Corruption Perceptions Index¹⁵

First launched in 1995, the Corruption Perceptions Index ("CPI") has been widely credited with putting the issue of corruption on the international policy agenda. It measures the perceived levels of public sector corruption in 183 countries and territories. The CPI ranks countries/territories based on how corrupt their public sector is perceived to be. It is a composite index, a combination of polls, drawing on corruption-related data collected by a variety of reputable institutions. The CPI reflects the views of observers from around the world, including experts living and working in the countries or territories evaluated.

Transparency International – Global Corruption Barometer¹⁶

The Global Corruption Barometer is the only world-wide public opinion survey on corruption. TI's Barometer is the largest cross-country survey to collect the general public's views on, and experiences of, corruption. In 2010 and 2011 the Barometer interviewed more than 100,000 people in 100 countries, making it the most comprehensive round since the survey was launched in 2003. The Barometer explores the general public's views about corruption levels in their country as well as their governments' efforts to fight corruption. The 2010/11 Barometer also probes the frequency of bribery, reasons for paying a bribe in the past year, and attitudes towards reporting incidents of corruption.

US Department of State Country Report of Terrorism - supporters of International Terrorism (Bureau of Counter Terrorism)¹⁷

The Country Report on Terrorism 2011 provides the Department of State's annual, statutorily mandated assessment of trends and events in international terrorism that transpired, including country-by-country breakdowns of foreign government counterterrorism co-operation, and profiles of designated terrorist organisations. As well as identifying countries experiencing terror activities it identifies State Sponsors of Terrorism which are Cuba, Iran, Sudan and Syria.

US Department of State – International Narcotics Control Strategy Report (INCSR)¹⁸

The Department of State's International Narcotics Control Strategy Report (INCSR) is the US Government's annual country-by-country two volume report that describes the efforts to attack all aspects of the international drug trade, chemical control, money laundering and financial crimes. Volume I covers drug and chemical control activities. Volume II covers money laundering and financial crimes.

US State Department - Trafficking in Persons Report 2010 (TIP) including Human Trafficking Tier Lists¹⁹

The Department of State prepared this report using information from US embassies, government officials, NGOs and international organisations, published reports and research trips. US diplomatic posts and domestic agencies reported on the trafficking situation and governmental action based on research that included meetings with a wide variety of government officials, local and international NGO representatives, officials of international organisations, journalists, academics, and survivors. Every US mission overseas employs at least one officer covering human trafficking issues. The US State Department places each country into one of three tiers. This placement is based more on the extent of government action to combat trafficking than on the size of the problem, although the latter is also an important factor. The analyses are based on the extent of governments' efforts to reach compliance with the TVPA's minimum standards for the elimination of human trafficking.

Fund for Peace (FFP) - The Failed States Index (2012) – The US think-tank²⁰

The Fund for Peace (FFP) is an independent, nonpartisan, non-profit research and educational organisation working to prevent violent conflict and promote sustainable security. FFP promotes sustainable security through research, training and education, engagement of civil society, building bridges across diverse sectors, and developing innovative technologies and tools for policy makers. FFP focuses on the problems of weak and failing states. Each year FFP releases its Failed States Index, a country ranking based on a set of indicators assessing stability and vulnerability. FFP hopes that governments and NGOs can use it as a policy tool for improvements.

The World Bank Group - Worldwide Governance Indicators (WGI)²¹

The Worldwide Governance Indicators (WGI) project reports aggregate and individual governance indicators for 213 economies over the period 1996–2010, for six dimensions of governance: Voice and Accountability, Political Stability and Absence of Violence, Government Effectiveness, Regulatory Quality, Rule of Law, and Control of Corruption. The aggregate indicators combine the views of a large number of enterprise, citizen and expert survey respondents in industrial

and developing countries. The individual data sources underlying the aggregate indicators are drawn from a diverse variety of survey institutes, think tanks, non-governmental organisations, and international organisations.

The World Bank Group - Ease of Doing Business Index 2012²²

Economies are ranked on their ease of doing business, from 1 – 183. A high ranking on the ease of doing business index means the regulatory environment is more conducive to the starting and operation of a local firm. This index averages the country's percentile rankings on 10 topics, made up of a variety of indicators, giving equal weight to each topic. The rankings for all economies are benchmarked to June 2011.

Doing Business 2012 is the ninth in a series of annual reports investigating the regulations that enhance business activity and those that constrain it. Doing Business presents quantitative indicators on business regulation and the protection of property rights that can be compared across 183 economies from Afghanistan to Zimbabwe and over time. The 2012 report presents results for two aggregate measures: the aggregate ranking on the ease of doing business and a new measure, the "distance to frontier." While the ease of doing business ranking compares economies with one another at a point in time, the distance to frontier measure shows how much the regulatory environment for local entrepreneurs in each economy has changed over time.

Further Resources

The following website has a lot of useful information and could be a helpful resource.

KnowYourCountry.com²³

The aim of KnowYourCountry.com is to gather relevant information and data from legitimate sources, collate it, and provide it to the public in a concise and manageable form, which is helpful in consideration of a particular country risk in the course of conducting business.

Hot Spots (in-Country and Regional)

Whilst most Country Risk Models provide a score and/or a rating on the Country level, the most sophisticated models also take into consideration other factors, for example, sub-country ratings, in particular for areas of countries where the risk is significantly different or areas that span parts of a number of countries. For example, in the US a number of in-country regions are well known and identified as High Intensity Drug Trafficking Area/High Intensity Financial Crime Area, including areas such as New York and New Jersey, areas of Chicago and Los Angeles and around Northern and Southern California, the South West border area, South Florida and Puerto Rico. Elsewhere in the world

in-country hot spots or regional hot spots can be identified which could increase the risk beyond the general country risk rating where exposure is to these areas. For more details see Part 2, Section 5, Regions, Countries, Criminals & Terrorists.

Hot Spots (in-Country & Regional)

Americas	
US	
- HIDTA/HIFCA

Diversion Risk or Close Proximity Risk Countries

Other areas where country risk may be important are those countries that could be seen as either in close geographical proximity to and/or have close commercial ties with sanctioned countries, with, for example, close commercial ties based on imports and exports as a percentage (%) of the commercial ties' country's Gross Domestic Product ("GDP").

The following is an example list.

Diversion Risk or Close Proximity Countries	
Afghanistan	Kuwait
Armenia	Kyrgyzstan
Azerbaijan	Lebanon
Central African Republic	Macau
Chad	Pakistan
Cyprus	Somalia
Egypt	Tajikistan
Eritrea	Turkey
Ethiopia	Turkmenistan
Iraq	Uganda
Jordan	United Arab Emirates
Kazakhstan	Uzbekistan
Kenya	Yemen

Free Trade Zones

Free Trade Zones (FTZs) have proliferated in recent years with conditions that make FTZs attractive to legitimate business also attract abuse by illicit actors, and according to the Financial Action Task Force (FATF) are a continuing concern.²⁴

According to a FATF report issued in 2011²⁵ there are approximately 3,000 FTZs in 135 countries around the world with a total turnover in the billions of US\$. FTZs are designated areas within jurisdictions in which incentives are offered to support the development of exports, foreign direct investment (FDI), and local employment. These incentives include exemptions from duty and taxes, simplified administrative procedures and the duty free importation of raw materials, machinery, parts and equipment. In addition to boosting economic opportunity, illicit actors have been able to launder the proceeds of crime, conducting unusual business activity, with concerns over trade-based money laundering (TBML), finance terrorism and facilitating WMD proliferation. In particular critics claim the lack of oversight by competent domestic authorities and weak procedures to inspect goods and register legal entities, including inadequate record-keeping and information technology systems and a lack of adequate co-ordination and co-operation between zone and Customs authorities encourages criminal activity. The misuse of free trade zones impacts all jurisdictions including those without FTZs of their own, because goods can originate from or be transshipped through FTZs not subject to adequate export controls. Proliferators of weapons of mass

destruction (WMD) abuse FTZs to tranship dual use goods and to disguise the final destination of sensitive items. FTZs can also be used to create legal entities and access the international financial system, providing opportunities to launder illicit proceeds. Many major zones are also located in regional financial centres linking international trade hubs with access to global centres of finance.

According to the BASCAP report, "Controlling the Zone: Balancing facilitation and control to combat illicit trade in the world's Free Trade Zones",²⁶ FTZs are particularly vulnerable to counterfeiting and piracy, due to lax enforcement of intellectual property rights.

Top Free Zones of the Future - 2012/13 Overall

Time Zone Risk

Whilst not per se, an obvious area to identify Country Risk aspects, the difference between, for example, a customer's home domicile to other attributes of risk whether client risk factors such as the use of Panama Foundations for a French customer, or the opening of bank accounts in Singapore for a Canadian or the wiring of funds via China for a Brazilian may be an important risk indicator. Using distance by utilising time to judge Country exposure may produce interesting results.

Introduction

To try to address the transnational threat posed by criminals bent on committing serious crimes and terrorists aiming at creating mayhem, governments have long worked together to fashion common agreements to respond to these threats. Many treaties and conventions have been adopted with a recognition that such instruments are necessary to harmonise approaches and to foster international cooperation. Whilst many International Instruments have been adopted over the last 30 years, the history of using international legal instruments to address collective concerns and to counter serious transnational criminality, is a much longer one. Since the beginning of the 20th century, efforts have been made to put in place an international drug control framework and to continually build on agreements reached. This process started with the 1909 Opium Conference in Shanghai¹ and to the landmark convention in 1912 in the Hague (the Netherlands) with the signing of the International Opium Convention² which the major powers committed to and led to the start of the criminalisation of the supply of opium.

drugs followed, as did chemical biological and nuclear weapons treaties, aircraft safety responding to terrorist threats and events and organised crime, anti-corruption, terrorism and WMD proliferation treaties, human trafficking and environmental protection amongst the most important. Many of these followed individual leadership by countries, particularly the US, where organised crime, anti-corruption and anti-money laundering instruments were first introduced.

Whilst treaties and conventions have played a major role in securing broad agreement and co-operation, it was recognised that an inter-governmental body was required to tackle money laundering and in 1989 at the behest of the G7 FATF was born, and a year later in 1990 FATF promulgated its first 40 Recommendations which were then revised and supplemented on numerous occasions, the most recent in 2012 where the 9 Special Recommendations on combating terrorism finance have been amalgamated with the 40 Recommendations on money laundering. These most recent standards come just over 100 years since the Hague International Drugs Convention and were implemented in 2013 and 2014, 25 years after the establishment of FATF.

As far as the financial institutions are concerned, and beyond public standard setters the Wolfsberg Group issues statements and provide standards for financial institutions to consider.

In this Part 1, Section 3 a chronology of the most important treaties and conventions, a number of the most important laws that have had international impact in the AML, Bribery and Corruption and Terror Finance field are set out, followed by a summary of FATF's work and an extract of the 2012 40 Recommendations, as well as a summary of the statements and work carried out by the Wolfsberg Group. Finally a summary of leading Sanctions and Embargoes Laws, complete this Section 3.

AML Treaties, Conventions & Major Laws

1912 - The International Opium Convention (the "Hague Convention")¹

The US convened a 13-nation conference of the International Opium Commission in 1909 in Shanghai, China in response to increasing criticism of the opium trade. The treaty was signed by Germany, the US, China, France, the UK, Italy, Japan, the Netherlands, Persia, Portugal, Russia, and Siam. The Convention provided that "The contracting powers shall use their best endeavours to control, or to cause to be controlled, all persons manufacturing, importing, selling, distributing, and exporting morphine, cocaine, and their respective salts, as well as the buildings in which these persons carry such an industry or trade. The Convention went into force globally in 1919 when it was incorporated into the Treaty of Versailles.

1925 - The International Opium Convention (the "Geneva Convention")²

This Convention introduced a statistical control system to be supervised by a Permanent Central Opium Board. Egypt, with support from China and the US, recommended that a prohibition on hashish be added to the Convention.

1925 - The Protocol for the Prohibition of the Use in War of Asphyxiating, Poisonous or other Gases, and of Bacteriological Methods of Warfare (the "Geneva Protocol")³

This Treaty prohibited the first use of chemical and biological weapons. It prohibited the use of chemical weapons and biological weapons, but had nothing to say about production, storage or transfer. Later treaties covered these aspects (see the 1972 Biological Weapons Convention and the 1993 Chemical Weapons Convention).

1933 - The USA Securities Act⁴

The Securities Act of 1933 was "enacted as a result of the market crash of 1929. The Securities Act of 1933 is also known as the "Truth in Securities Act". The 1933 Act was based on the idea that companies offering securities should provide potential investors with sufficient information about both the issuer and the securities to make an informed investment decision. The legislation had two main goals: (1) to ensure more transparency in financial statements so investors can make informed decisions about investments, and (2) to

establish laws against misrepresentation and fraudulent activities in the securities markets. The Securities Act of 1933 was the first major piece of federal legislation regarding the sale of securities. Prior to this legislation, the sale of securities was primarily governed by state laws; however, the market crash of 1929 raised some serious questions about the effectiveness of how the markets were being governed. Due to the turmoil surrounding the investing community at this time, the federal government had to bring back stability and investor confidence in the overall system.

1933 - USA Banking Act (Glass-Steagall Act)⁵

In 1933 in the aftermath of the Great Depression and widespread bank failures, Congress enacted the Banking Act of 1933. Four sections of the Act are referred to as the Glass-Steagall Act. Many critics believed that banks had engaged in inappropriate securities activities that harmed investors. The Glass-Steagall Act addressed these concerns in a very broad way: Section 16 restricted commercial national banks from engaging in investment banking; Section 20 prohibited any member bank from affiliating in specific ways with an investment bank; Section 21 restricted investment banks from engaging in any commercial banking; and Section 32 prohibited investment bank directors, officers, employees or principals from serving in those capacities at a commercial member bank of the Federal Reserve System. Some believe President Franklin D. Roosevelt signed the 1933 Glass-Steagall Act, specifically targeted at and breaking up JP Morgan & Co.

1934 - USA Securities & Exchange Act⁶

The Securities Exchange Act of 1934, also called the Exchange Act, '34 Act, or Act of '34, is a law governing the secondary trading of securities (stocks and bonds) in the US. The Act and related statutes form the basis of regulation of the financial markets and their participants in the US. The 1934 Act also established the Securities and Exchange Commission (SEC), the agency primarily responsible for enforcement of US federal securities law. The Act regulates the secondary trading of securities that companies issue in the primary market, between persons often unrelated to the issuer, frequently through brokers or dealers. One area subject to the Act is the actual securities exchange, the place where many people purchase and sell US securities (stocks and bonds). The Act also regulates broker-dealers. The 1934 Act addressed insider trading directly and has been supplemented by later SEC rulemaking and case law.

1936 - The USA Commodity Exchange Act⁷

The Commodity Exchange Act became the Grain Futures Act and extended Federal regulation to a list of commodities that included cotton, rice, mill feeds, butter, eggs, and Irish potatoes, as well as grains. The Grain Futures Commission became the Commodity Exchange Authority and would later become the Commodity Futures Trading Commission (CFTC) and is responsible for regulating US Futures and Options Markets.

1942 - USA Exchange Act Rule 10b-5⁸

In 1942, the SEC was presented with a situation in which the president of a company was buying shares from the existing shareholders at a low price by misrepresenting the company's financial condition. While Securities Act S17(a) (1) prohibited fraud and misstatements in the sale of securities, there was no comparable provision prohibiting such practices in connection with the purchase of securities. The SEC's Assistant Solicitor accordingly lifted the operative language out of S17(a), made the necessary modifications, added the words 'in connection with the purchase or sale of any security,' and presented the product to the Commission as Securities Exchange Act Rule 10b-5. It was unanimously approved without discussion. In the more than 50 years since its adoption, this simple rule has been involved in countless SEC and private proceedings, and applied to almost every conceivable kind of situation. In the 1960s and early 1970s, many federal appellate courts and district courts developed expansive interpretations of Rule 10b-5 (and other antifraud provisions of the securities laws).

1961 - Single Convention on Narcotic Drugs (amended by 1972 Protocol)⁹

The 1961 Single Convention was intended to codify most of the numerous international drug conventions dating back to 1912, and placed under international control primarily plant-based substances such as coca, marijuana and opium, as well as their derivatives. Acknowledging the need for medicinal opiates, states parties were obliged to submit estimates to an independent committee (the International Narcotics Control Board) of their opiate needs for the coming year. A 'statistical returns system' was also created in the 1961 Single Convention to assess state implementation of its terms. It included information relating to the production of drugs, drug consumption and imports/ exports of controlled substances. The 1972 Protocol to the 1961 Single Convention expanded the role of the International Narcotics Control Board in relation to the illicit production, use and traffic in narcotic drugs.

1969 – Convention on Offences and Certain Other Acts Committed On Board Aircraft (the “Tokyo Convention”)¹⁰

This international treaty was signed in Tokyo on 14 September 1963 and entered into force on 4 December 1969. The Convention created offences for any acts jeopardising the safety of persons or property on board civilian aircraft while in-flight and engaged in international air navigation. Coverage included the commission of or the intention to commit offences and certain other acts on board an aircraft.

1970 - USA/Organised Crime Control Act¹¹

The Organised Crime Control Act was the US legislative response to combat organised crime. The legislation followed Congressional hearings in the late 1950s into the early 1960s that identified to the public

the breadth and pervasiveness of organised crime in the US, including its control over international labour unions, and other important areas of US business and trade. A critical component of this provision was the passage of the Racketeer Influenced and Corrupt Organisations Act¹² (RICO Act). This provision was designed to provide an important prosecutorial tool to allow law enforcement to attack corruption on an "enterprise" basis. Although, it was primarily intended to attack organised crime families, its use has been expanded to non-organised crime organisations, such as security fraud cases. The statute allows prosecutors to charge different members of the organisation under one scheme, with significant criminal sanctions, whether it be the leader who directed the criminal scheme or the actors themselves that carried out the crimes.

1970 - Nuclear Non-Proliferation Treaty (“NPT”)¹³

The NPT is based on a central bargain, that the NPT non-nuclear weapon states agree never to acquire nuclear weapons and the NPT nuclear weapons states agree in exchange, to share the benefits of peaceful nuclear technology and to pursue disarmament aimed at the ultimate elimination of their arsenals. There are five nuclear weapons states under the Treaty, being the permanent members of the UN Security Council, US, Russia, UK, France and China. Countries that also are believed to have nuclear weapons are either not members of the NPT or have withdrawn, for example, India and Pakistan, the rogue state of North Korea and Israel.

1970 - USA - Bank Secrecy Act¹⁴

The Bank Secrecy Act of 1970 (or BSA, or otherwise known as the Currency and Foreign Transactions Reporting Act) requires financial institutions in the US to assist US government agencies to detect and prevent money laundering. Specifically, the act required financial institutions to keep records of cash purchases of negotiable instruments, and file reports of cash purchases of these negotiable instruments of more than \$10,000 (daily aggregate amount), and to report suspicious activity that might signify money laundering, tax evasion, or other criminal activities. The BSA was originally passed in 1970, and amended several times since then, most notably by the USA Patriot Act. The BSA is sometimes referred to as an "Anti-Money Laundering" ("AML") law or jointly as "BSA/AML".

1971 - Convention for the Suppression of Unlawful Seizure of Aircraft (the “Hague Convention”)¹⁵

Signed at The Hague on 16 December 1970 and entering into force on 14 October 1971, the Convention for the Suppression of Unlawful Seizure of Aircraft contains 14 articles relating to hijacking as well as guidelines for what is expected of governments when dealing with hijackings.

1971 - Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation (the “Montreal Convention”)¹⁶

Signed on 23 September 1971 in Montreal, the Convention deals with acts other than those covered by the 1963 Tokyo and the 1970 Hague Convention. Also known as the Montreal Convention, it defined a wide spectrum of unlawful acts against the safety of civil aviation. The Convention contained detailed provisions on jurisdiction, custody, prosecution and extradition of the alleged offender going further than the Hague Convention and the Tokyo Convention. The Convention attempted to establish a form of universal jurisdiction over the offender.

1971 - Convention on Psychotropic Substances¹⁷

The 1971 Convention extended international control to cover synthetic psychotropic substances, such as LSD and MDMA, as well as their precursor chemicals. There was no system of estimates in the 1971 Convention, but it did retain a statistical returns system similar to that of the 1961 Single Convention. Its control system was therefore considerably weaker than that of the 1961 Single Convention. This was due in large part to the strong pharmaceutical lobby keen to draw a balance between, on the one hand, using controls to protect the interests of established producers from new competitors, and on the other, continuing to expand production and worldwide marketing by ensuring that such controls did not go too far.

1972 - The Biological Weapons Convention¹⁸

This was the result of prolonged efforts by the international community to extend the prohibition already on use of biological weapons, contained in the 1925 Geneva Protocol, to cover also possession and development.

1973 - Convention on the Prevention and Punishment of Crimes against Internationally Protected Persons, including Diplomatic Agents¹⁹

The Convention was adopted in 1973 and provided that states must make attacks upon diplomats for a crime in internal law, and obliged them to extradite or prosecute offenders. However, in exceptional cases, a diplomat could be arrested or detained on the basis of self-defence or in the interests of protecting human life.

1975 - Convention on International Trade in Endangered Species of Wild Flora and Fauna (CITES or the “Washington Convention”)²⁰

This Convention was drafted as a result of a resolution adopted in 1963 at a meeting of members of the International Union for Conservation of Nature (IUCN). Its aim was to ensure that international trade in specimens of wild animals and plants did not threaten the survival of the species in the wild, and it accorded varying degrees of protection to more than 33,000 species of animals and plants.

1977 - Switzerland - The agreement on the Swiss banks’ Code of Conduct with regard to the Exercise of Due Diligence (CDB) (revised latest 2008)²¹

Established in 1977, the Swiss Banks' Code of

Conduct on the Exercise of Due Diligence (CDB) set out detailed rules on identifying bank customers including in particular establishing the beneficial owner of every account where appropriate, document verification, clarification of the background of unusual transactions and the establishment and maintenance of records of transactions. Since its enactment the Code has been revised on a five-year cycle, the latest being the 2008 revision. Failure to comply with CDB rules triggers financial penalties. Whilst the Code is to be distinguished from the financial due diligence process as regulated in the Swiss Money Laundering Act and Money Laundering Ordinance, the CDB is effectively a minimum standard required to be complied with by Swiss Banks. The CDB in 1977 was perhaps the first of its kind, in setting out detailed KYC requirements for financial institutions to avoid money laundering risks.

1977 - USA Foreign Corrupt Practices Act (FCPA)²²

The FCPA is a law known primarily for two of its main provisions, one that addresses accounting transparency requirements under the Securities Exchange Act of 1934 requiring companies to maintain proper books and records and another concerning bribery of foreign officials. The anti-bribery provisions of the FCPA prohibit issuers, domestic concerns, and any person from making use of interstate commerce corruptly, in furtherance of an offer or payment of anything of value directly or indirectly to a foreign official, foreign political party, or candidate for political office, for the purpose of influencing any act of that foreign official in violation of the duty of that official, or to secure any improper advantage in order to obtain or retain business

1983 - International Convention against the Taking of Hostages (The “Hostage Convention”)²³

This Convention was adopted by the General Assembly of the UN in 1979, and entered into force in 1983. It provides that "any person who seizes or detains and threatens to kill, to injure, or to continue to detain another person in order to compel a third party, namely, a State, an international intergovernmental organisation, a natural or juridical person, or a group of persons, to do or abstain from doing any act as an explicit or implicit condition for the release of the hostage commits the offence of taking of hostage within the meaning of this Convention".

1984 - USA - Insider Trading Sanctions Act²⁴

The Insider Trading Sanctions Act of 1984 provided that, if the SEC believed that any person had bought or sold a security while in possession of material non-public information, as well as those who provided information not generally available to the public, the SEC may bring an action in US district court to seek a civil penalty. The penalty may be up to three times the profit gained or loss avoided. The Act also provides for criminal fines to be levied.

1985 - UK Company Securities (Insider Dealing) Act²⁵

The UK Company Securities (Insider Dealing) Act prohibited persons who had access to material non-public information by virtue of their position with a company (including directors, officers, employees, and various kinds of agents of the company) from trading in the securities of the company while in possession of such information. These insiders were also prohibited from making selective disclosure of such information to others ('tipping'); and it prohibited their tippees from trading on basis of such inside information. The Act also prohibited persons in possession of non-public information about a proposed takeover of a company from trading in that company's stock. The Act established only criminal liability, and its prohibitions applied only to individuals who acted while knowingly in possession of inside information. The Act was replaced by the Criminal Justice Act 1993 which represented an extension of the basis of liability for the insider dealing offence and contained a wider definition of 'securities' and 'insider' than the 1985 Act and the nature of the inside information necessary to impose liability was also altered.

1986 - USA - Money Laundering Control Act²⁶

The Money Laundering Control Act of 1986 made money laundering a federal crime. It consists of two sections, It for the first time criminalised money laundering. It prohibited individuals from engaging in a financial transaction with proceeds that were generated from certain specific crimes, known as "specified unlawful activities" (SUAs). There was no minimum threshold of money, nor was there the requirement that the transaction succeed in actually disguising the money. Moreover, a "financial transaction" has been broadly defined, and need not involve a financial institution, or even a business. Merely passing money from one person to another, so long as it is done with the intent to disguise the source, ownership, location or control of the money, has been deemed a financial transaction under the law.

1987 - Convention on the Physical Protection of Nuclear Material (CPPNM)²⁷

This Convention on the Physical Protection of Nuclear Material was adopted in 1979 in Vienna, Austria and entered into force in 1987. The Convention is deposited with the International Atomic Energy Agency. In 2005 a diplomatic conference was convened to amend the CPPNM and strengthen its provisions. The US Department of State said that: the Convention provided for certain levels of physical protection during international transport of nuclear material. It also established a general framework for cooperation among states in the protection, recovery, and return of stolen nuclear material. Further, the Convention lists certain serious offenses involving nuclear material which state parties are to make punishable and for which offenders shall be subject to a system of extradition or submission for prosecution.

1988 - Protocol for the Suppression of Unlawful Acts of Violence at Airports Serving International Civil Aviation, supplementary to the Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation²⁸

Signed in Montreal in 1988, the Protocol for the Suppression of Unlawful Acts of Violence at Airports Serving International Civil Aviation, supplementary to the Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation adds to the definition of "offence" given in the Montreal Convention of 1971: unlawful and intentional acts of violence against persons at an airport serving international civil aviation which cause or are likely to cause serious injury or death and such acts which destroy or seriously damage the facilities of such an airport or aircraft not in service located thereon or disrupt the services of the airport. The qualifying element of these offences is the fact that such an act endangers or is likely to endanger safety at that airport. These offences are punishable by severe penalties, and States are obliged to establish jurisdiction over the offences not only in the case where the offence was committed in their territory but also in the case where the alleged offender is present in their territory and they do not extradite him to the state where the offence took place.

1988 - BIS - Basel Committee on Banking Supervision Prevention of Criminal use of the Banking System for the purposes of Money Laundering²⁹

The Basel Committee issued its first paper on money laundering publishing a statement of ethical principles which encouraged bank management to put in place effective procedures to ensure that all persons conducting business with their institutions are properly identified, that transactions that do not appear legitimate are discouraged, and that co-operation with law enforcement agencies is achieved.

1988 - UN Convention against illicit traffic in narcotic drugs and psychotropic substances (the "Vienna Convention")³⁰

The 1988 Vienna Convention was the first international convention to address money laundering and is relied upon by later conventions and treaties, building on the commitments made. Whilst the Convention focussed on drug trafficking it clearly recognised the links to organised and other forms of serious crimes. The Convention is also important because for the first time it included as a purpose to "deprive persons engaged in illicit traffic from the proceeds of their criminal activities and thereby eliminate their main incentive for so doing". Article 3 of the Convention calls on States to incriminate three types of activities. First the conversion or transfer of drug derived property for the purpose of concealing or disguising the illicit origin of the property" or second the "concealment or disguise" of drug derived property such as its nature, source, location, dispositions, movement, ownership and rights

to it and third the "acquisition, possession or use" of property, knowing at the time of receipt, that such property was derived from offences related to illicit drug trafficking. Although the term "money laundering" itself was not used, these three elements constitute the basis for what is today the crime of money laundering. The Convention includes additional measures in relation to jurisdiction, confiscation, extradition, mutual legal assistance and co-operation between states. Almost all countries in the world have signed and ratified the Vienna Convention.

1989 - European Community Directive Coordinating Regulations on Insider Trading³¹

Adopted in 1989, the EC Directive Coordinating Regulations on Insider Trading defined "inside information" as information of a "precise nature" about a security or issuer which has not been made public which, if it were made public, "would likely have a significant effect on the price" of the security (Article 1); It prohibited insiders from taking advantage of inside information (Article 2); It prohibited insiders from tipping or using others to take advantage of inside information (Article 3); It applied its prohibitions to tippees with "full knowledge of the facts" (Article 4); and it required all members to enact legislation complying with the Directive by June 1992. A fundamental difference between the EC Directive and the US prohibition against insider trading under Section 10b and Rule 10b-5 as developed by the US courts, is that the Directive did not require that the insider trader breach a fiduciary duty to the source of the information for liability to attach.

1990 - FATF 40 Recommendations First Issue³²

In April 1990, less than one year after the FATF was created, they issued a report containing a set of Forty Recommendations, which provided a comprehensive plan of action needed to combat the misuse of financial systems by persons laundering drug money. The 40 Recommendations provided a complete set of counter-measures against money laundering covering the criminal justice system and law enforcement, the financial system and its regulation, and international co-operation. They set out the essential measures that countries should have in place to: identify the risks, and develop policies and domestic coordination; pursue money laundering, terrorist financing and the financing of proliferation; apply preventive measures for the financial sector and other designated sectors; establish powers and responsibilities for the competent authorities (for example, investigative, law enforcement and supervisory authorities) and other institutional measures; enhance the transparency and availability of beneficial ownership information of legal persons and arrangements; and facilitate international cooperation. Since the 1990 40 Recommendations, FATF has revised them in 1996, 2003 and 2012, added 8 Special Recommendations on Terrorism Financing in 2001 and a ninth in 2004 re-issuing most recently a consolidated set of 40 Recommendations in 2012. Together the

Forty Recommendations and Special Recommendations set out the principles for action and allow countries a measure of flexibility in implementing these principles according to their particular circumstances and constitutional frameworks. Both sets of FATF Recommendations are intended to be implemented at the national level through legislation and other legally binding measures.

1991 EU First Money Laundering Directive³³

The EU First Money Laundering Directive was enacted in response to growing concerns that the developing financial system could be used for criminal purposes and it recognised the possible susceptibility of professionals to money laundering activities. The First Directive provided the initial framework for the subsequent Second and Third Directives. It established key preventative measures such as customer/client identification, record-keeping and central methods of reporting suspicious transactions. It was passed to ensure a universal approach was adopted by EU member states to combat the problem of money laundering. The First MLD requirements stated that: (i) due diligence checks must be carried out by all credit and financial institutions before entering into any business relationship or before conducting any transaction over a certain threshold; (ii) all collated identification documents, evidence and existing records collected as part of the due diligence checks must be kept for at least five years by credit and financial institutions; (iii) there must be close international co-operation and harmonisation between credit and financial institutions and their supervisory authorities and the establishment of a mandatory central system of reporting; (iv) the confidentiality rules regarding customer information should be toned down in relation to disclosing suspected money laundering offences to the authorities; and (v) special protection should be afforded to credit and financial institutions, their employees and their directors who have to breach confidentiality rules in order to make the disclosure.

1992 - Convention for the Suppression of Unlawful Acts Against the Safety of Maritime Navigation³⁴

The main purpose of the convention is to ensure that appropriate action is taken against persons committing unlawful acts against ships. These include the seizure of ships by force; acts of violence against persons on board ships; and the placing of devices on board a ship which are likely to destroy or damage it. The convention obliges contracting governments either to extradite or prosecute alleged offenders. It was adopted in 1988 and entered into force on March 1, 1992. Protocols were added in 2005.

1993 - Convention on Biological Diversity (CBD)³⁵

The Convention on Biological Diversity (CBD), negotiated under the auspices of the UN Environment Programme (UNEP), was adopted in 1992 and entered into force in 1993. Its aims are the conservation of biological diversity, the sustainable use of biological

resources, and the fair and equitable sharing of benefits arising from the use of genetic resources. One of the major challenges facing the Convention on Biological Diversity is the communication of research results in a way that provides the policy makers, their advisors, the scientific community and other stakeholders with helpful insights. To help implement the Convention on Biological Diversity, the EU launched its own Biodiversity Strategy in 1998. It contained general measures to promote conservation and the sustainable use of biological diversity, in line with Article 6 of the CBD. Four major Biodiversity Action Plans were initiated in 2001, on the conservation of natural resources, agriculture, fisheries and economic and development co-operation. In 2001, Heads of member states adopted a Sustainable Development Strategy (SDS) in Gothenburg, Sweden. The SDS strengthened the Biodiversity Strategy by adopting the target to 'halt' the decline in biodiversity by 2010 inside the EU. In July 2002, the EU adopted its Sixth Environment Action Programme ('Environment 2010: Our Future, Our Choice'), which established a ten-year framework for priorities under the SDS. The programme addresses nature and biodiversity protection.

1993 - The Chemical Weapons Convention³⁶

This Chemical Weapons Convention essentially mirrors the Biological Weapons Convention 1975, but also provides for the destruction and verification of all Chemical stockpiles. As of November 2011, around 71% of the declared stockpiles of chemical weapons had been destroyed. Several countries, that are not members are suspected of having chemical weapons, especially North Korea and Syria, whilst others including Sudan are accused by some of not declaring accurately their stockpiles. The 2 countries with the largest declared stockpiles, Russia and the USA are in the process of destroying them, with the former at around 57% and the latter at 90% completed.

1996 - USA Inter-American Convention against Corruption³⁷

Adopted in 1996, the OAS Convention represented a regional consensus about what states should do in the areas of prevention, criminalisation, international cooperation and asset recovery. The Convention has been ratified by all members of the OAS. It covers corruption in the public sector, both on demand and supply. It gives a wide and inclusive interpretation to what constitutes "corruption offences" including bribery, domestic and foreign; illicit enrichment; money laundering and concealment of property. Measures adopted to curb bribery include preventive measures (creating and enforcing codes of conduct), criminalisation and regional assistance cooperation measures, as well as provisions on recovery of assets. Obligations towards the Convention are a combination of mandatory and discretionary provisions. For monitoring, a committee of experts has been established that is to conduct technical analysis of the implementation of the Convention by parties.

1996 - FATF 40 Recommendations - Revised³⁸

Initially developed in 1990, the 40 Recommendations were revised for the first time in 1996 to reflect evolving money laundering trends and techniques, broaden their scope well beyond drug-money laundering, and to anticipate potential future threats. In 1996, the FATF issued a series of interpretative notes designed to clarify their application.

1997 - International Convention for the Suppression of Terrorist Bombings (Terrorist Bombings Convention)³⁹

The International Convention for the Suppression of Terrorist Bombings was designed to criminalise the unlawful and intentional use of explosives in public places with the intention to kill, to injure, or to cause extensive destruction to compel a government or an international organisation to do or to abstain from doing some act. It also sought to promote police and judicial cooperation to prevent, investigate and punish those acts.

1998 - UN Political Declaration and Action Plan against Money Laundering⁴⁰

The UN's Political Declaration and Action Plan against Money Laundering was adopted in 1998. It urged jurisdictions and regions throughout the world to apply the following principles by 2003: 1. Establishment of a legislative framework to criminalise the laundering of money derived from serious crimes in order to provide for the prevention, detection, investigation and prosecution of the crime of money laundering; 2. Identification, freezing, seizure and confiscation of the proceeds of crime; and 3. Establishment of an effective financial and regulatory regime to deny criminals and their illicit funds access to national and international financial systems, thus preserving the integrity of financial systems worldwide and ensuring compliance with laws against money laundering.

1998 - EU Council of Europe Criminal Law Convention & Civil Law Convention⁴¹

These EU Council of Europe Criminal Law Convention & Civil Law Conventions were both adopted in 1998. The former Convention represents a European regional consensus on what states should do in the areas of criminalisation and international cooperation with respect to corruption. The Convention covers the public sector and private sector (private-to-private) corruption and covers a broad range of offences including bribery (domestic and foreign), trading in influence, money laundering and accounting offences. Penalty ranges from criminalisation to recovery of assets, with regional co-operation. The latter Convention was the first attempt to define common international rules in the field of civil law and corruption. In particular, it provides for compensation for damages as a result of acts of corruption. While it also covers the public and private sector, a broad scope is given to the Convention covering the "requesting, offering, giving or accepting of a bribe or any other undue advantage or the prospect

thereof". Civil law remedies for injured persons include compensation for damages from corruption; invalidity of corrupt contracts; whistleblower protection. The monitoring mechanism is the same as adopted for the Criminal Convention. The Convention called for mandatory provisions with no reservations allowed in respect of any provision of the Convention.

1998 - BIS - Basel Committee on Banking Supervision - "Prevention of criminal use of the banking system for the purpose of money laundering"⁴²

The BCBS issued a general statement of ethical principles which encouraged banks' management to put in place effective procedures to ensure that all persons conducting business with their institutions are properly identified; that transactions that do not appear legitimate are discouraged; and that cooperation with law enforcement agencies is achieved. The Committee considered that the first and most important safeguard against money laundering is the integrity of banks' own managements and their vigilante determination to prevent their institutions becoming associated with criminals or being used as a channel for money laundering. The statement is intended to reinforce those standards of conduct.

1999 - OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions⁴³

The Convention was signed on 17 December 1997 and came into force on 15 February 1999. It aimed at reducing corruption in developing countries by encouraging sanctions against bribery including foreign public offices in international business transactions carried out by companies based in the Convention member countries. Its goal is to create a truly level playing field in today's international business environment. Countries that have signed the Convention are required to put in place legislation that criminalises the act of bribing a foreign public official. The OECD has no authority to implement the convention, but instead monitors implementation by participating countries. Countries are responsible for implementing laws and regulations that conform to the Convention and therefore provide for enforcement.

1999 - International Convention for the Suppression of the Financing of Terrorism ("The Terrorist Financing Convention")⁴⁴

The Convention was designed to criminalise acts of those who finance terrorist activities and to promote police and judicial cooperation to prevent, investigate and punish financing those acts. Article 2.1 defines the crime of terrorist financing as the offence committed by "any person" who "by any means, directly or indirectly, unlawfully and wilfully, provides or collects funds with the intention that they should be used or in the knowledge that they are to be used, in full or in part, in order to carry out" an act "intended to cause death or serious bodily injury to a civilian, or to any other person

not taking an active part in the hostilities in a situation of armed conflict, when the purpose of such act, by its nature or context, is to intimidate a population, or to compel a government or an international organisation to do or to abstain from doing any act." State parties to this treaty committed themselves also to freezing and seizure of funds intended to be used for terrorist activities, to share the forfeited funds. Moreover, states committed themselves not to use bank secrecy as a justification for refusing to cooperate.

1999 - USA Financial Services Modernisation Act Gramm-Leach-Bliley⁴⁵

"Glass-Steagall" was one of the many necessary measures taken in 1933 by President F D Roosevelt and the Democratic Congress to deal with the aftermath of the Great US Stock Market Crash. The Policy response was to erect a wall between investment banking and commercial banking (see above). In the 1990s, as another bull market took hold, momentum built to overturn Glass-Steagall. Commercial banks overeager to get into high margin businesses, saw commercial banks with their massive customer bases as important distribution channels for stocks, mutual funds and other financial profits. To many it was the 1998 acquisition by Sandy Weill's Travellers which owned Salomon Smith Barney of Citicorp, which lobbied hard for changes that may have made a difference. It had been given a temporary waiver in 1988 in order to allow the acquisition to go ahead. The year after the "Financial Services Modernisation Act" was passed effectively deleting the prohibition on commercial banks owning investment banks and vice versa. In reforming the US Financial Services Industry to allow consolidation the Act rejected appeals to introduce comprehensive AML standards into law, particularly KYC and beneficial owners' standards for all relevant accounts.

2000 - Convention against Transnational Organised Crime (the "Palermo" Convention)⁴⁶

The Convention provided for measures to prevent and combat transnational organised crime and is further supplemented by three protocols which target specific areas and manifestations of organised crime: Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children; Protocol against the Smuggling of Migrants by Land, Sea and Air; and the Protocol against the Illicit Manufacturing and Trafficking in Firearms.

2001 - EU Second Money Laundering Directive⁴⁷

The Second MLD amended and updated the First MLD on the prevention of the use of the financial system for the purpose of money laundering. The aim of the Second MLD was to refine the existing provisions created by the First MLD and to plug the gaps in the legislation highlighted by the 40 Recommendations, suggested by the FATF. The Second MLD adopted a broader definition of money laundering, taking into account underlying offences such as corruption and thus expanding the predicate offences. The Second MLD

also clarified that currency exchange offices, money transmitters and investment firms were included within the scope of the directive as they were susceptible to money laundering also. In addition, the Second MLD added the authority to identify, trace, freeze, seize and confiscate any property and proceeds linked to criminal activities. Moving on from the First MLD, the Second MLD touched upon the possibility of the Directive becoming applicable to lawyers participating in financial or corporate transactions. The proposition to extend the provisions of the Directive to the legal profession was met with fierce opposition by the European Parliament. It was due to fears that it would encroach on client confidentiality rules and could potentially violate the integrity of court proceedings. A compromise was reached and the scope of the Second Directive was not extended to cover professionals, such as lawyers. Thus, lawyers were exempt from reporting information received in the course of defending or representing a client.

2001 - BIS - Basel Committee on Banking Supervision its Customer Due Diligence Paper for Banks⁴⁸

In 1999 a Committee working group made findings that led the Committee to conclude that there existed great deficiencies in a large number of countries' know-your-customer (KYC) policies for banks. Judged from a supervisory perspective, KYC policies in some countries had significant gaps and in others they were considered non-existent. Even among countries with well-developed financial markets, the extent of KYC robustness varied. Consequently, the Basel Committee asked the Working Group on Cross-border Banking to examine the KYC procedures currently in place and to draw up recommended standards applicable to banks in all countries. The resulting paper was issued in 2001 setting out a KYC framework that would become the benchmark for supervisors to establish national practices and for banks to design their own programmes. The paper outlined four essential elements necessary for a sound KYC programme. These elements are: (i) customer acceptance policy; (ii) customer identification; (iii) on-going monitoring of higher risk accounts; and (iv) risk management. The principles laid down have been accepted and widely adopted by jurisdictions throughout the world as a benchmark for commercial banks and a good practice guideline for other categories of financial institution.

2001 - USA - Uniting and Strengthening America by Providing Appropriate Tools to Restrict, Intercept and Obstruct Terrorism Act (the "PATRIOT" Act)⁴⁹
The Patriot Act was signed into law by President George W. Bush on 26 October 2001. The Act, a response to the terrorist attacks of 11 September 2001, dramatically reduced restrictions in law enforcement agencies' gathering of intelligence within the US, expanded the Secretary of the Treasury's authority to regulate financial transactions, particularly those involving foreign individuals and entities; and broadened the discretion

of law enforcement and immigration authorities in detaining and deporting immigrants suspected of terrorism-related acts. The Act also expanded the definition of terrorism to include domestic terrorism, thus enlarging the number of activities to which the USA Patriot Act's expanded law enforcement powers could be applied. The Act also amended portions of the Money Laundering Control Act of 1986 and the Bank Secrecy Act of 1970 (detailed above). It criminalised the financing of terrorism and augmented the existing BSA framework by strengthening customer identification procedures; prohibited financial institutions from engaging in business with foreign shell banks; required financial institutions to have due diligence procedures (and enhanced due diligence procedures for foreign correspondent and private banking accounts); improved information sharing between financial institutions and the US government by requiring government-institution information sharing and voluntary information sharing among financial institutions; expanded the Anti-Money Laundering programme requirements to all financial institutions; increased civil and criminal penalties for money laundering; provided the Secretary of the Treasury with the authority to impose "special measures" on jurisdictions, institutions, or transactions that are of "primary money laundering concern"; facilitated records access and required banks to respond to regulatory requests for information within 120 hours; required federal banking agencies to consider a bank's AML record when reviewing bank mergers, acquisitions, and other applications for business combinations. In 2011, President Obama signed a four-year extension of three key provisions in the USA Patriot Act: roving wiretaps, searches of business records and conducting surveillance of "lone wolves", individuals suspected of terrorist-related activities not linked to terrorist groups.

2001 - FATF 8 Special Recommendations on Terrorism Finance (later to be become 9 Special Recommendations in 2004)⁵⁰

In October 2001, following the September 11 terrorist attacks in the US, the FATF issued the Eight Special Recommendations to deal with the issue of terrorism financing. These Recommendations contained a set of measures aimed at combating the funding of terrorist acts and terrorist organisations, and are complementary to the 40 Recommendations. The continued evolution of money laundering techniques led the FATF to revise the FATF standards comprehensively in June 2003 and in October 2004 the FATF published a ninth recommendation to its list of Special Recommendations on Terrorist Financing. The ninth recommendation called for countries to adopt measures to detect and prevent the physical cross-border transportation of money related to terrorist financing and money laundering. See below for Anti-Money Laundering and counter-terrorist financing efforts.

2002 - USA - Act to Protect Investors by improving the accuracy and reliability of corporate disclosures made pursuant to the securities laws and for other

purposes; also known as "Public Company Accounting Reform and Investor Protection Act" and "Corporate and Auditing Accountability and Responsibility Act" "Sarbanes Oxley" or "SOX"⁵¹
In late 2001, Enron collapsed into bankruptcy, taking Arthur Andersen down with it. Between then and mid-2002, Xerox, Adelphia, Worldcom, and Tyco were among the companies in the headlines for executive misconduct and multi-billion dollar restatements. The Sarbanes-Oxley Act sought to strengthen accountability by auditors, executives, and boards of directors and to improve communication of companies' activities and financial condition to investors. The law stressed that companies disclose 'on a rapid and current basis' any material changes in operations or financial condition.

2003 - FATF 40+8 Recommendations - Revised⁵²

The FATF Recommendations were revised a second time in 2003. The scope of the recommendations were amended to include designated non-financial businesses and professionals. Designated non-financial businesses and professionals are defined by the FATF to include Casinos, Real Estate Agents, Dealers in Precious Stones and Metals, and Lawyers Accountants and Trust and Company Service Providers. The 2003 amendments applied, for the first time, customer due diligence and record keeping practices to Designated Non-Financial Businesses and Professionals. They are required to report transactions suspected of being linked to money laundering to the designated authorities. In the case of lawyers, the FATF recommended that lawyers be excused from this responsibility if their knowledge or suspicions arise as a result of legal professionally privileged circumstances. The 2003 amendments revised the recommendations to include the FATF's enhanced counter terrorist financing mandate.

2003 - UN Convention against Corruption (UNCAC)⁵³

The Convention was adopted in Mexico, on 31 October 2003. The Convention is the first legally binding international anti-corruption instrument. In its eight Chapters and 71 Articles, the UNCAC obliges its States Parties to implement a wide and detailed range of anti-corruption measures affecting their laws, institutions and practices. The Convention covers five main areas: 1) Prevention - measures such as the establishment of anticorruption bodies and enhanced transparency in the financing of election campaigns and political parties address both the public and private sectors. Requirements are also established for the prevention of corruption in the judiciary and in public procurement. The Convention calls on countries to actively promote the involvement of nongovernmental and community based organisations, as well as other elements of civil society, to raise public awareness of corruption. 2) criminalisation and law enforcement measures -

countries are required to establish criminal and other offences to cover a wide range of acts of corruption. This includes not only basic forms of corruption, such as bribery and the embezzlement of public funds, but also trading in influence and the concealment and "laundering" of the proceeds of corruption. 3) International co-operation - countries agree to cooperate in the fight against corruption, including prevention and investigation activities, and the prosecution of offenders. The Convention also binds countries to render specific forms of mutual legal assistance in gathering and transferring evidence for use in court and to extradite offenders. Countries must also undertake measures to support the tracing, freezing, seizure and confiscation of the proceeds of corruption. 4) asset recovery - This is an important issue for many developing countries where high-level corruption has plundered the national wealth, and where resources are badly needed for reconstruction and the rehabilitation of societies under new governments. Measures include the prevention and detection of transfers of illicitly acquired assets, the recovery of property, and the return and disposition of assets. 5) Implementation mechanisms - the Convention needs 30 ratifications to come into force. A Conference of the States Parties is established to review implementation and facilitate activities required by the Convention.

2003 - The Trafficking in Persons Protocol Palermo Protocol (Protocol to the Convention against Transnational Organised Crime 2000)⁵⁴

The Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children, also referred to as the Trafficking Protocol or UN TIP Protocol, is a protocol to the Convention against Transnational Organised Crime. The Trafficking Protocol entered into force on 25 December 2003. The Protocol commits states to prevent and combat trafficking in persons, protecting and assisting victims of trafficking and promoting cooperation among states in order to meet those objectives.

2003 - African Union Convention on Preventing and Combating Corruption⁵⁵

Adopted in 2003, this African Union Convention on Preventing and Combating Corruption has been ratified by 53 African countries. It covers the public and the private sector. Offences covered are bribery (domestic or foreign), diversion of property by public officials, trading in influence, illicit enrichment, money laundering and concealment of property. All provisions are mandatory including those on private to private corruption. The Convention provides for prevention, criminalisation, regional cooperation and mutual legal assistance as well as the recovery of assets. The follow-up mechanism provided for in Article 22 calls for an Advisory Board which has broad responsibilities for promoting anti-corruption work, collecting information on corruption in Africa, developing methodologies, advising governments, developing codes of conduct for public officials, and building partnerships. In addition it

is required to submit a report to the Executive Council on a regular basis on the progress made by each State Party in complying with the provisions of the African Union Convention. States parties are required to report to the Board on their progress in implementing the Convention on an annual basis. They are also required to ensure and provide for the participation of civil society in the monitoring process.

2003 - BIS - Basel Committee on Banking Supervision issued a General Guide to account opening and customer identification⁵⁶

The Basel Committee on Banking Supervision in its paper on Customer Due Diligence for Banks published in October 2001 referred to the intention of the Working Group on Cross-border Banking to develop guidance on customer identification, being an essential element of an effective customer due diligence programme which banks needed to put in place to guard against reputational, operational, legal and concentration risks. It was also necessary in order to comply with Anti-Money Laundering legal requirements and a prerequisite for the identification of bank accounts related to terrorism. The Guide issued sets account opening and customer identification guidelines and a general guide to good practice based on the principles of the Basel Committee's Customer Due Diligence for Banks paper. This document did not cover every eventuality, but instead focused on some of the mechanisms that banks can use in developing an effective customer identification programme.

2004 - The Smuggling of Migrants by Land, Sea and Air - Palermo Protocol (Protocol to the Convention against Transnational Organised Crime 2000)⁵⁷

The Protocol against the Smuggling of Migrants by Land, Sea and Air, supplementing the Convention against Transnational Organised Crime, was adopted by the UN in Palermo, Italy in 2000. It is also referred to as the Smuggling protocol. The Smuggling Protocol entered into force in 2004. The Protocol is aimed at the protection of rights of migrants and the reduction of the power and influence of organised criminal groups that abuse migrants. It emphasises the need to provide migrants with humane treatment, and the need for comprehensive international approaches to combating people smuggling, including socio-economic measures that address the root causes of migration.

2004 - BIS - Basel Committee on Banking Supervision issued its "Consolidated KYC Risk Management"⁵⁸

A key challenge in implementing sound KYC policies and procedures was how to put in place an effective groupwide approach. The legal and reputational risks for many banks are global in nature. As such, it is essential that each group develops a global risk management programme supported by policies that incorporate groupwide KYC standards. Policies and procedures at the branch or subsidiary level must be consistent with and supportive of the group KYC standards

even where for local or business reasons such policies and procedures are not identical to the group^s. The Committee issued its paper on this topic at the same time recognising that implementing effective KYC procedures on a groupwide basis is more challenging than many other risk management processes. Similar to the approach to consolidated credit, market and operational risk, effective control of consolidated KYC risk requires banks to coordinate their risk management activities on a groupwide basis across the head office and all branches and subsidiaries.

2005 - EU Market Abuse Directive ("MAD")⁵⁹

The EU's Market Abuse Directive was one of a number of EU initiatives implementing the EU's then Financial Services Action Plan for completing the single market for financial services. The Directive was agreed in 2003 and came into force in 2005. The aim of the Directive is to promote clean and efficient markets, regulated in a harmonised way throughout the EU. To this end the Directive requires member states to outlaw insider dealing and market abuse and to provide for timely disclosure of price sensitive information.

2005 - EU Third Money Laundering Directive⁶⁰

The Third Directive took into account FATF's revised Anti-Money Laundering and Counter Terrorist Financing Standards of 2003 was adopted in 2005 and became operative in December 2007. The scope of the Directive increased significantly. The requirements under "know your customer" have been replaced by an increased level of customer due diligence on a risk basis. The Directive specifies when customer due diligence should be carried out. It includes where a business relationship is established, transactions over €15,000 (previously €13,000) where there is a suspicion of money laundering or terrorist financing or where there are any doubts as to the veracity or adequacy of previously obtained ID. In order to complete CDD, an organisation must complete the following: (i) verify the customer's identity; (ii) identify any beneficial owner; (iii) obtain information on the purpose and nature of the business relationship; (iv) carry out ongoing monitoring. Simplified due diligence may be applied to specified low risk customers and products/services. While the identification and information requirements do not apply under simplified due diligence, ongoing monitoring does continue to apply. This broadens the previous exemption for designated bodies to include listed companies, public authorities, pensions and other low risk products. Enhanced due diligence is required where a customer does not present themselves for identification purposes, correspondent banking and Politically Exposed Persons (PEPs). The Directive also introduced requirements to address issues around the vulnerability of so called Designated Non-Financial Businesses and Professions such as lawyers, notaries, accountants, real estate agents, casinos and encompassing trust and company services, exceeding €15,000, and measures against the financing of terrorism.

2005 - Protocol against the Illicit Manufacturing and Trafficking in Firearms, their Parts and Components and Ammunition - Palermo Protocol (Protocol to the Convention against Transnational Organised Crime 2000)⁶¹

The Protocol supplements the UN Convention against Transnational Organised Crime (2000) and its purpose is to strengthen and unify international cooperation and to develop cohesive mechanisms to prevent, combat and eradicate the illicit manufacturing of and trafficking in firearms, their parts and components and ammunition (firearms). Parties to the Protocol undertake to adopt and implement the strongest possible legislation to investigate and prosecute the offences stemming from the illicit manufacturing of and trafficking in firearms. Specific measures include the confiscation, seizure and destruction of firearms illicitly manufactured or trafficked; maintenance of records for at least 10 years in order to identify and trace firearms; the issuance of licences for the import and export of firearms; and the marking of firearms permitting identification of the manufacturer of the firearm, and the country of and year of import. Parties undertake to cooperate extensively at the bilateral, regional and international levels in order to achieve the Protocol's objectives including providing training and technical assistance to other Parties. Finally, Parties undertake to exchange relevant case-specific information on matters such as authorized producers, dealers, importers, exporters and carriers of firearms as well as information on organised criminal groups known to take part in the illicit manufacture and trafficking of such items.

2005 – Protocol to the Convention for the Suppression of Unlawful Acts against the Safety of Maritime Navigation⁶²

In March 1988 a conference in Rome adopted the Convention for the Suppression of Unlawful Acts against the Safety of Maritime Navigation. The main purpose of the Convention was to ensure that appropriate action is taken against persons committing unlawful acts against ships. These include the seizure of ships by force; acts of violence against persons on board ships; and the placing of devices on board a ship which are likely to destroy or damage it. The 2005 Protocol to the Convention criminalised the use of a ship as a device to further an act of terrorism; criminalises the transport on board a ship various materials knowing that they are intended to be used to cause, or in a threat to cause, death or serious injury or damage to further an act of terrorism; criminalises the transporting on board a ship of persons who have committed an act of terrorism; and introduced procedures for governing the boarding of a ship believed to have committed an offence under the Convention.

2006 US Unlawful Internet Gambling Enforcement Act (UIGEA)

This Act made it a crime to knowingly accept most forms of payment "in connection with the participation of another person in unlawful internet gambling." As

a result of this Act most financial institutions refuse to permit credit card payments to be processed, for example, in US dollars and by US persons, striking a significant blow to those targeting the largest market for internet gambling.

2008 - Switzerland- Market Conduct Rules - FINMA Circular⁶³

According the Federal Act on Stock Exchanges and Securities Trading (Stock Exchange Act, or SESTA) which ensures transparency and the proper functioning of securities markets and equality in the treatment of investors, market developments must be monitored in a manner that ensures that insider trading, price manipulation or other legal violations may be detected (market surveillance). This Circular establishes rules on regulatory supervision pertaining to the market conduct of regulated market participants when engaging in securities transactions. It contains directives for preventing market manipulation and examples of accepted market practices. For example it states that, "Securities trading is to be based upon generally available or published information on securities and issuers or upon information derived therefrom. Information on securities and issuers is deemed generally available when it is published or disseminated in the media or via the usual information channels in the financial sector, or if it is derived from such information. All other information on securities and issuers is to be regarded as confidential. Misusing knowledge of confidential price sensitive information for securities transactions is not permissible (misuse of information). Information is deemed price sensitive where it is capable of significantly influencing the stock market price or the valuation of the respective securities. Specifically, such information pertains to circumstances that substantially impact a company's organisational structure, its executive and business management bodies, its course of business, its financial or earnings situation and thus its valuation, and is therefore capable of effecting material changes in the market price. These circumstances may be grounds for public disclosure and/or be subject to legal or self regulatory requirements to provide information (disclosure obligations pursuant to Article 20 SESTA or ad hoc publicity according to stock exchange regulations). The wrongful dissemination of confidential price-sensitive information or making references or recommendations based thereon pertaining to engaging in securities transactions are also deemed to constitute misuse of information. Rumours or vague hints are not deemed confidential information. However, knowingly spreading rumours or vague hints for the purpose of invoking same is not permissible. Taking advantage of the expected market reaction of market participants and of securities prices employing the knowledge of an impending announcement of investment recommendations ("scalping") is not permissible.

2009 - UK - FSA Code of Market Conduct⁶⁴

The UK broadened its attack on Market Abuse by

enacting section 118 of the Financial Services and Markets Act 2000 (FSMA), see above which was updated to also incorporate changes required arising out of the EU Market Abuse Directive (MAD) which came into force in July 2005 (see above). The MAD provisions were similar to those in a number of existing EU countries, in particular in the UK. The UK FSA issued a Code of Market Conduct (August 2009) which runs to 52 pages and covers seven market abuses spanning: i) insider dealing, ii) improper disclosure, iii) misuse of information, iv) manipulating transactions, v) manipulating and “fictitious” devices, vi) dissemination of information, and vii) misleading behaviour and distortion. These seven types of behaviour, as well as techniques and examples are set out by the FSA. The market abuse regime was introduced as a means of bringing more people who trade on inside information to justice. It sits alongside the criminal regime of insider dealing but operates with the lower standard of proof required for civil proceedings and potentially covers more transactions. However, in addition to these civil offences, both insider dealing and market manipulation remain criminal offenses. The market abuse regime covers: financial instruments (such as shares, warrants, futures, contracts for differences, options and debt instruments) traded on every regulated market in Europe (or for which an application for admission to trading has been made). In the UK, the relevant markets include the London Stock Exchange (both the full list and AIM), PLUS (the old OFEX) and commodity derivative markets; all transactions relating to those instruments even if they are carried out off-market. In certain circumstances, behaviour in respect of other, related instruments or underlying commodities is also caught, even if those instruments are not themselves traded on a regulated market. Behaviour involving securities traded on a foreign unregulated market may be caught if an option linked to them is traded in London.

2009 - OECD Recommendations for Further Combating Bribery of Foreign Public Officials in International Business Transactions⁶⁶

The OECD adopted on 25 May 2009 a new Recommendation to strengthen the role of tax authorities in the combat against bribery that succeeds to the former 1996 Recommendation. The 2009 Recommendation buildt on the powerful impact of the non-deductibility of bribes to foreign officials by requiring legislation or any other binding means to prohibit the tax deductibility of bribes to foreign public officials. A further Recommendation was issued on 9 December 2009, when the OECD marked the 10th anniversary of the entry into force of the OECD Anti-Bribery Convention. The new Recommendation was intended to enhance the ability of the OECD to prevent, detect and investigate allegations of foreign bribery and includes the Good Practice Guidance on Internal Controls, Ethics and Compliance. This Good Practice Guidance, contained in Annex 2 of the Recommendation, calls on companies to protect

themselves against the risks of foreign bribery by putting in place strict internal controls and establishing ethics and compliance programmes.

2010 - USA - The Foreign Account Tax Compliance Act (FATCA)⁶⁷

The Foreign Account Tax Compliance Act was enacted as part of the Hiring Incentives to Restore Employment (HIRE) Act, and is considered by the US Government as an important development in the US efforts to combat tax evasion by US persons holding investments in offshore accounts. The Act came into force on 1 January 2014. FATCA requires foreign banks to identify any American account holders and disclose their balances, receipts, and withdrawals to either (i) local IRS (to be completed) or (ii) directly to the US Internal Revenue Service (IRS), or be subject to a 30% withholding tax on income from US financial assets held by the banks. Owners of these foreign-held assets must report them on a new Form 8938 along with US tax returns if they are worth more than US \$50,000; a higher reporting threshold applies to overseas residents. The reporting requirements are in addition to reporting of foreign financial assets to the US Treasury Department, particularly the “Report of Foreign Bank and Financial Accounts” (FBAR) for foreign financial accounts exceeding US \$10,000 required under Bank Secrecy Act regulations issued by the Financial Crimes Enforcement Network (FinCEN).

2010 - UK - Bribery Act⁶⁸

The UK Bribery Act entered into force on 1 July 2011 and is described as “the toughest anti-corruption legislation in the world”. It has a wider range of offences than the US FCPA in that it covers all forms of bribery not just involving foreign public officials but also commercial bribery and it does not permit so called facilitation payments. The Act creates four offences: (i) giving a bribe; (ii) receiving a bribe; (iii) bribing a foreign public official; and (iv) failure by an organisation to prevent bribery. The penalties for committing a crime under the Act are a maximum of ten years imprisonment, along with an unlimited fine, and the potential for the confiscation of property as well as the disqualification of company directors. The Act has a near-universal jurisdiction, allowing for the prosecution of an individual or company with links to the UK, regardless of where the crime occurred.

2010 - Convention on Cluster Munitions (CCM)⁶⁹

The CCM is an international treaty that prohibits the use, transfer and stockpile of cluster bombs, a type of explosive weapon which scatters submunitions (bomblets) over an area. The Convention was signed in 2008 and came into force in 2010.

2010 - USA - Dodd-Frank Wall Street Reform Act⁷⁰

Named after its Democratic sponsors in Congress, Senator Chris Dodd and Representative Barney Frank, the law aimed at preventing a repeat of the 2008 global financial crisis. Dodd-Frank is the most comprehensive

US financial reform since the Glass-Steagall Act. Like Glass-Steagall, it sought to regulate the financial markets and make another economic crisis less likely. Banks were deregulated in 1999 by the Gramm-Leach-Bliley Act, which repealed Glass-Steagall. Dodd-Frank proposed the following areas of regulation set out in a 2000-page act which included sweeping new rules for banks, hedge funds and complex financial transactions called derivatives. The following are the most important: (i) Regulate credit cards, loans and mortgages. The Consumer Financial Protection Agency (CFPA) consolidated protection from many different agencies. It oversees credit reporting agencies, credit and debit cards, payday and consumer loans (but not auto loans from dealers). The CFPA regulated credit fees, including credit, debit, mortgage underwriting and bank fees. It protects homeowners in real estate transactions by requiring them to understand risky mortgage loans. It also requires banks to verify borrower's income, credit history and job status. The CFPA is under the US Treasury Department; (ii) Oversees Wall Street: the Financial Stability Oversight Council looks out for risks that affect the entire financial industry. It also oversees non-bank financial firms like hedge funds. If any of these companies get too big, it can recommend they be regulated by the Federal Reserve, which can ask it to increase its reserve requirement. This prevents another AIG from becoming too big to fail. The Council is chaired by the Treasury Secretary, and has nine members: the Fed, SEC, CFTC, OCC, FDIC, FHFA and the new CFPA; (iii) Volcker Rule: The Volcker Rule bans banks from using or owning hedge funds for the banks' own profit. That is because they would often use their depositors' funds to do so. Banks can use hedge funds for their customers only. Determining which funds are for the banks' profits and which funds are for customers has been difficult. Therefore, Dodd-Frank gave banks seven years to divest the funds. They can keep any funds if that are less than 3% of revenue. (iv) Regulate risky derivatives: Dodd-Frank required that the riskiest derivatives, like credit default swaps, be regulated by the SEC or the Commodity Futures Trading Commission (CFTC). In this way, excessive risk-taking can be identified and brought to policy-makers' attention before a major crisis occurs. A clearinghouse, similar to the stock exchange, must be set up so these derivative trades can be transacted in public. However, Dodd-Frank left it up to the regulators to determine exactly the best way to put this into place, which has led to a series of studies; (v) Bring hedge funds trades into the light: one of the causes of the 2008 global financial crisis was that, since hedge funds and other financial advisers were not regulated, no one knew what they were investing in or how much was at stake. That's why the Fed and other agencies thought the mortgage crisis would be confined to the housing industry. To correct for that, Dodd-Frank says that hedge funds must register with the SEC and provide date about their trades and portfolios so the SEC can assess overall market risk. States are

given more power to regulate investment advisers, since Dodd-Frank raises the asset threshold limit from US\$30mio to US\$100mio. (vi) Oversee credit rating agencies: Dodd-Frank created an Office of Credit Rating at the SEC to regulate credit ratings agencies like Moody's and Standard & Poor's. Many blame the agencies for over-rating some bundles of derivatives and mortgage-backed securities. This misled investors who didn't realise the debt was in danger of not being repaid. The SEC can require agencies to submit their methodologies for review, and can deregister an agency that gives faulty ratings; (vii) increase supervision of insurance companies: It created a new Federal Insurance Office under the Treasury Department, which identifies insurance companies like AIG that create risk to the entire system. It will also gather information about the insurance industry and make sure affordable insurance is available to minorities and other underserved communities. It will represent the US on insurance policies in international affairs. The new office will also work with the states to streamline regulation of surplus lines insurance and reinsurance. (viii) Reform the Federal Reserve: the Government Accountability Office(GAO) was allowed to audit the Fed's emergency loans during the financial crisis. It can review future emergency loans, when needed. The Fed cannot make an emergency loan to a single entity, like Bear Stearns or AIG, without Treasury Department approval, (although the Fed did work closely with Treasury during the crisis). The Fed must make public the names of banks that received these loans or TARP funds. Finally, both to ensure cooperation by financial insiders and fight corruption in the financial industry, the Dodd-Frank Act contains a whistle blowing provision, where persons with information about security violations can report information to the Government for a financial reward. US President Barack Obama, who signed the Act into law, said: “The American people will never again be asked to foot the bill for Wall Street's mistakes” but many in the financial services sector say the law and accompanying regulations are confusing, expensive and in some cases unworkable.

2011 - EU - Second Market Abuse Directive (“MAD 2”) - Proposals⁷¹

On 20 October 2011 the European Commission published proposals intended to update and strengthen the existing framework ensuring investor protection under the existing EU Market Abuse Directive issued in 2005 (see above). The European Parliament could adopt the proposals towards the end of this year, in which case it will be another two years after that for them to take effect - member states get 24 months to look at the implications for their domestic legislation in green). The proposals consist of a regulation on insider dealing and market manipulation (the “Regulation”) and a new directive on criminal sanctions for insider dealing and market manipulation (the “Directive”). The proposed update of the MAD is intended to ensure a consistent approach to market abuse issues

by regulators across the EU and provide an updated regulatory framework in order to keep pace with market developments. The Regulation introduces prohibitions, requirements and corresponding harmonised civil and administrative sanctions and powers intended to be directly applicable in each member state. Implementation of these measures in national legislation will therefore not be necessary once the Regulation has entered into force. ESMA shall provide further technical standards for amongst others insider lists and appropriate public disclosure of inside information. Minimum criminal sanctions are set out in the Directive, which is to be implemented on a national level. The Regulation broadens and clarifies the scope of the current market abuse framework by clarifying the definitions of "market manipulation" and "insider trading" and expanding the scope of European market abuse legislation to cover transactions in financial instruments traded on MTFs or OTFs and OTC transactions and in any related financial instruments traded on these markets or on a regulated market. The Regulation also clarifies which high frequency trading strategies constitute prohibited market manipulation. The Regulation sets out a broader definition of inside information than currently included in the MAD. Most notably, information regarded as relevant for the making of an investment decision by a reasonable investor, who regularly deals on the market and in certain financial instruments or related spot commodity contracts, is considered inside information. It will therefore no longer be necessary that such information is "price sensitive". While this expansion of the definition of inside information will broaden the scope of what is considered "insider dealing", it will not increase the quantity of information which must be disclosed to the public, due to the fact that the Regulation provides for an exemption to the obligation to disclose inside information which is not "price sensitive". The Regulation is intended to broaden the scope of the market abuse framework to cover those spot markets which are related to and have an effect on financial and derivative markets. Therefore the Regulation provides for broadened definitions of inside information and market manipulation with respect to commodity derivatives trading. The definition of inside information in relation to commodity derivatives will be aligned with the general definition of inside information and extended to cover price sensitive information which is relevant to the related spot commodity contract as well. The Regulation introduces a new definition for inside information relating to emission allowances. The prohibition on insider trading will also cover emissions allowances traded in auctions and auctioned products based thereon. Insider dealing: the Regulation explicitly prohibits "attempts to engage in insider dealing" and clarifies that both actual cancellations and attempts to cancel transactions are considered use of inside information which constitutes insider dealing. Market Manipulation: The Regulation introduces a new definition of "attempting to engage in market manipulation". In contrast to the MAD,

the Regulation no longer provides for an exemption for market manipulation which can be justified and which is performed in line with a market practice accepted by a national regulator and notified to ESMA. Also, the prohibition to manipulate the market under the Regulation is explicitly extended to cover spot commodity contracts. Furthermore, the Regulation provides for descriptions of acts which constitute market manipulation, including specific acts performed through algorithmic trading with respect to electronic media.

2012 - FATF 40 Recommendations⁷²

(International Standards on Combating Money Laundering and the Financing of Terrorism & Proliferation). In 2012, the Recommendations were again revised and included additional areas such as tax crimes. The main changes were: (i) Combating the financing of the proliferation of weapons of mass destruction through the consistent implementation of targeted financial sanctions when these are called for by the UN Security Council; (ii) Improved transparency to make it harder for criminals and terrorists to conceal their identities or hide their assets behind legal persons and arrangements; (iii) Stronger requirements when dealing with politically exposed persons (domestic PEPs); (iv) Expanding the scope of money laundering predicate offences by including tax crimes; (v) An enhanced risk-based approach which enables countries and the private sector to apply their resources more efficiently by focusing on higher risk areas; (vi) More effective international cooperation including exchange of information between relevant authorities, conduct of joint investigations, and tracing, freezing and confiscation of illegal assets; and (vii) Better operational tools and a wider range of techniques and powers, both for the financial intelligence units, and for law enforcement to investigate and prosecute money laundering and terrorist financing.

2012 - Switzerland - Stock Exchange Act (Amended)⁷³

Under pressure to step up the battle against insider trading, Switzerland has recently acted. The changes made to the Swiss Stock Exchange Act in 2012 essentially bring Switzerland into line with international requirements. Insider trading only became a crime in Switzerland in 1988, but the law was written far more narrowly than in other countries. Unlike the UK or the US, insider trading was an offense only in relation to the issue of new securities, mergers and acquisitions, but not ahead of earnings announcements, even when they contained potentially market-moving information. Moreover, Swiss law did not require mandatory jail time, and the fines were considered low by some to be an effective deterrent. Whilst standards were improved following the issuance of the Swiss Market Conduct Rules - FINMA Circular 2008, the new changes to the Act created new standards that aim to combat market abuse (insider dealing, front running, market manipulation and improper disclosure) even further

and more efficiently. In particular, insider trading and price manipulation is now prohibited for all market participants and both offences treated as crimes. The changes entered into force on 1 April 2013.

2012 - EU 4th AML Directive - Proposed and Funds Transfer Regulations Proposed⁷⁴

The EU proposals seek to update and improve the EU's existing 3rd AMLD and the Funds Transfers Regulation with the aim of further strengthening the EU's defences against money laundering and terrorist financing and ensuring the soundness, integrity and stability of the financial system. They reflect the latest FATF Recommendations issued in 2012. More specifically, both proposals provide for a more targeted and focussed risk-based approach. The proposed new Directive clarifies and reinforces the rules on customer due diligence and introduces new provisions to deal with domestic politically exposed persons. It goes beyond the FATF requirements by bringing within its scope all persons dealing in goods or providing services for cash payment of €7,500 which will lower the existing threshold set at €15,000. The proposed Directive also ensures a more comprehensive coverage of the gambling sector (in the light of concerns that the wide sector is vulnerable to money laundering) and includes an explicit reference to tax crimes. The proposals also consider increasing the sanctioning powers of the competent authorities by introducing a set of minimum principle-based rules to strengthen administrative sanctions and a requirement for them to coordinate actions when dealing with cross-border cases. Proposals to update the Regulation on information accompanying the transfers of funds has also been made in light of the revised international standards. Following are the key changes proposed: (i) Consolidating the risk-based approach: the new standards put more focus on the risk-based approach. This means that countries need to clearly understand the money laundering and terrorist financing risks which affect them, and adapt their Anti Money laundering/Counter Financing of Terrorism (AML/CFT) system to the nature of these risks – with enhanced measures where the risks are higher and the option of simplified measures where the risks are lower. Thus, countries will be able to target their resources more effectively and apply preventative measures that correspond to the risks of particular sectors or activities. A well-implemented risk-based approach means that the AML/CFT system will be more effective and less costly; (ii) Improving Transparency measures: there is a lack of transparency at the moment around the ownership of companies, making them potentially vulnerable to misuse by criminals and terrorists. The new Recommendations have strengthened transparency requirements. Reliable information available about the ownership and control of companies, trusts, and other legal persons or legal arrangements is required as well as more rigorous requirements on the information which must accompany electronic funds transfers. Measures to improve transparency, implemented on a global basis, will make it harder for criminals and terrorists to conceal their activities; (iii) Towards more effective international co-operation: with the increasing globalisation of money laundering and terrorist financing threats, the FATF has also enhanced the scope of international cooperation between government agencies, and between financial groups (for example, simplified extradition mechanisms). The revised Recommendations will allow more effective exchanges of information, tracing, freezing, confiscation and repatriation of illegal assets; (iv) Identification of clear operational standards: the FATF Recommendations concerned with law enforcement and FIUs have been expanded significantly. The revisions clarify the role and functions of the operational agencies responsible for combating money laundering and terrorist financing; and set out the range of investigative techniques and powers which should be available to them. In addition new threats and new priorities are covered by the new proposals as stated by the FATF Recommendations as follows: (i) Corruption & Politically Exposed Persons - the FATF Recommendations tighten the requirements on "politically exposed persons"; that is, people who may represent a higher risk of corruption by virtue of the positions they hold. The requirement to apply enhanced due diligence to foreign politically exposed persons has been expanded with the new Recommendations also applying to domestic politically exposed persons and international organisations, and to the family and close associates of all politically exposed persons – reflecting the methods used by corrupt officials and kleptocrats to launder the proceeds of corruption; (ii) Tax Crimes - the list of predicate offences for money laundering has been expanded to include tax crimes which are brought within the scope of the powers and authorities used to combat money laundering. This will contribute to better coordination between AML and tax authorities, and remove potential obstacles to international cooperation regarding tax crimes; and (iii) Terrorist Financing – the financing of terrorism remains a serious concern for the international community, and a major focus of the FATF. The Recommendations reflect both the fact that terrorist financing is a long-standing concern, and the close connections between Anti-Money Laundering measures and measures to counter the financing of terrorism. The two proposals are open now for consultation and will have to be adopted by the European Parliament and the Council of Ministers under the ordinary legislative procedure. Whilst the EU 3rd MLD allowed lighter customer due diligence measures to be applied in the case of financial institutions situated in EU/EEA countries, it also allowed and extended these lighter measures to institutions situated in third countries which impose AML requirements considered to be "equivalent" to those laid down in the Directive. Included as part of the definition of EU/EEA member states are of course EU member states themselves for example, Germany or Romania and Cyprus and EEA member states including Norway, Iceland and Liechtenstein. In addition also included are certain

overseas territories of member states, for example, the French overseas territories (Mayotte, New Caledonia, French Polynesia, Saint Pierre and Miquelon and Wallis and Futuna) and the Dutch ones, Aruba, Curacao, Saint Maarten, Bonaire, Saint Eustatius and Saba. The UK Crown Dependencies (Jersey, Guernsey, Isle of Man) are also to be considered as equivalent. True third country states considered as "equivalent" are: Australia; Brazil; Canada; Hong Kong; India; Japan; South Korea; Mexico; Singapore; Switzerland; South Africa and the US. The proposed 4th MLD will no longer promote a precise model or list of "equivalent" third countries, though EU/EEA countries will retain "equivalent status" and instead recommend financial institutions use their own risk based models and approaches.

2012 - EU - Directive on Freezing and Confiscation of The Proceeds of Crime - Proposed⁷⁵

In October 2012 the EU announced its intention to propose a directive on freezing and confiscation of proceeds of crime in the EU, alongside the European Parliament that has created a special Committee on organised crime, corruption and money laundering with a one year term. In the course of this one year the Committee will investigate the level of infiltration in EU's legal economy, public administration and financial systems of organised crime, including the mafia. Sonia Alfano MEP (ALDE, Italy), Parliament's rapporteur on this issue, said: "The establishment of an Anti-Mafia Committee in the European Parliament represents a real turning point in the history of EU policies. As for the Proposed Directive, "putting criminals in jail is only one part of this job. The other crucial work is making sure that crime does not pay - and ensuring that we empty criminals' pockets, and get their money back into the legal economy where it belongs. In times of crisis this is even more crucial", European Commissioner for Home Affairs, Cecilia Malmstrom said. The proposal referred to the total amount of criminal profits in 2009 which was approximately US\$2.1 trillion, according to UN estimates. There are no general estimates for the EU, but data for individual member states are instructive. In Italy, the profits of organised crime in 2011 were estimated at €150bio. In 2006 organised crime in the UK has earned £15bio. Compared to the profits of criminal activity, the amounts seized by governments are too modest - in 2009 seized assets amounted to €281mio in Germany, €185mio in France, €154mio in Britain, €50mio in the Netherlands. However, corruption costs the European taxpayer 1% of European gross domestic product annually, and only in Italy €6 bio annually sink into corruption schemes, according to the European Court of Auditors. The Commission concludes that "although regulated by EU and national laws, confiscation of criminal assets remains underdeveloped and underutilised." Therefore, the Directive provides a minimum set of rules to be applied by member states aimed at more efficient use of confiscation and freezing of assets acquired through criminal activity. In addition to the classical confiscation, resulting from a final criminal conviction,

the directive allows in a limited number of cases the application of: (i) confiscation of assets which are not directly linked to a specific crime, but which clearly result from similar criminal activities committed by the convicted person (extended confiscation); (ii) confiscation where assets have been transferred from the suspect to a third party; and (iii) confiscation of criminal assets where a criminal conviction is not possible because the suspect is deceased, permanently ill or has fled (non-conviction based confiscation). The new rules give prosecutors the right to freeze property in danger of being dissipated, hidden or transferred out of the jurisdiction with a view to getting a court ruling later. The member states are required to manage the frozen property in such a way that it does not lose value before being confiscated. To that end, they should create national centralised offices or equivalent mechanisms. At the same time, the directive instructs in details how the freezing and confiscation to be accompanied by guarantees that fundamental rights will be respected, particularly the presumption of innocence and the right of property. Member states are asked to keep comprehensive statistics and send them to the Commission each year to ensure evaluation of the effectiveness of their confiscation systems. The countries have two years after the Directive's entry into force to bring their legislation in line. Moreover, they should communicate to the Commission the texts of the main provisions of their national law in the covered by the directive areas.

2012 - USA - Advance Notice of Proposed Rulemaking on Customer Due Diligence (Expanding BO ID requirements) - Proposed⁷⁶

On 5 March 2012, FinCEN proposed for consultation a Customer Due Diligence (CDD) regulation ("CDD Proposal") that would be applicable to banks, and other FI's. For many US FI's, the CDD Proposal may significantly increase their overall Anti-Money Laundering (AML) compliance burden. Generally, the CDD Proposal consists of four elements, the key aspects of which include a proposed new beneficial owner definition that focuses on legal entities as accountholders, subject to limited potential exceptions. The proposal is expected to apply also to money services businesses, including providers of prepaid access, insurance companies, casinos, dealers in precious metals, stones and jewels and non-bank mortgage lenders or originators. Customer Identification and Verification: This element would require FI to identify, and on a risk-basis verify, the identity of each customer, to the extent reasonable, such that the institution can form a reasonable belief that it knows the true identity of each customer. FinCEN states that this element of the CDD Proposal is largely consistent with existing CIP obligations and has expressed the view that it would not impose any new or additional requirements. However, FinCEN notes that current customers, banks, governmental entities and publicly traded companies, are exempt from existing CIP requirements, and has requested comment on

whether the BO requirement should apply with respect to those exempt customers. Account Nature and Purpose: With respect to this element, FinCEN has proposed language that would require covered financial institutions to understand the nature and purpose of the account and expected activity associated with the account, for the purpose of assessing the risk and identifying and reporting suspicious activity. FinCEN states that this element of the CDD Proposal would not impose new or additional requirements on financial institutions given existing guidance in this area and the obligation to detect and report suspicious activity, however, no such obligation is express in existing regulations. Obtaining Beneficial Ownership Information: The third element of the CDD Proposal would expand upon the two limited situations where FIs are currently obligated by regulation to obtain beneficial ownership information—in connection with certain correspondent accounts for foreign banks and private banking accounts—by imposing what FinCEN describes as a categorical requirement, subject to potential limited exceptions, to obtain such information for all customers. Thus, under this element of CDD Proposal, financial institutions would be required to identify the beneficial owner(s) of all customers, and to verify the beneficial owners' identity pursuant to a risk-based approach. FinCEN states that it anticipates providing additional guidance regarding entities that would be considered both low- and high-risk customers, as well as guidance on what covered financial institutions should do in the event they are unable to identify or verify a beneficial owner. As part of this element of the CDD Proposal, FinCEN is considering a definition of a beneficial owner that would capture either: (i) each of the individual(s) who, directly or indirectly, through any contract, arrangement, understanding, relationship, intermediary, tiered entity or otherwise owns more than 25% of the equity interests in the entity; or (ii) if there is no individual who satisfies the first prong, then the individual who, directly or indirectly, through any contract, arrangement, understanding, relationship, intermediary, tiered entity or otherwise has at least as great an equity interest in the entity as any other individual. In addition, the individual with greater responsibility than any other individual for managing or directing the regular affairs of the entity also would be considered a beneficial owner. FinCEN anticipates that this definition would generally apply to legal entity customers and would not be used for purposes of current requirements (i.e., those imposed in connection with certain correspondent accounts for foreign banks and private banking accounts). In addition, recognizing that covered financial institutions may not have beneficial ownership information on existing customers, FinCEN is also considering whether and how the CDD Proposal would apply to existing customers of such institutions and is seeking comment on how a beneficial ownership identification requirement could be phased into ongoing CDD. Of interest to issuers of prepaid cards and other institutions that hold assets in omnibus or other intermediated accounts, FinCEN has requested comment on the difficulties associated with identifying beneficial owners in connection with such accounts. This aspect of the CDD Proposal will also be significant to various investment vehicles that maintain accounts at regulated institutions. FinCEN states that it is considering whether a potential explicit obligation to identify the beneficial owners of assets in those accounts should be based upon the financial institution's risk assessment of the customer, or whether a more specific obligation would be appropriate. With respect to account opening, FinCEN anticipates that, in general, the individual opening the account on behalf of a legal entity customer will identify its beneficial owner, and that covered financial institutions will generally be able to rely upon the beneficial ownership information presented by the customer. With respect to verification of that information, FinCEN has identified two possible approaches on which comment is sought. The first approach would require the financial institution to verify the identity of the individual identified by the customer as the beneficial owner of the account (i.e., verifying the existence of the identified beneficial owner). The second approach would require the financial institution to verify that the individual identified by the customer as the beneficial owner is indeed the beneficial owner of the customer (i.e., verifying the status of the identified individual), which is a much more challenging effort. In either case, FinCEN contemplates that the required procedures would need to be reasonable and practicable, and sufficient to form a reasonable belief that the financial institution knows the identity or status of the beneficial owner. Ongoing CDD: The fourth element of the CDD Proposal addresses ongoing due diligence with respect to customer relationships. Observing that due diligence is an ongoing obligation and requires financial institutions to have policies and procedures in place to maintain the accuracy of their customer risk profiles, FinCEN is proposing to require covered financial institutions to establish and maintain appropriate policies, procedures and processes for conducting on-going monitoring of all customer relationships and additional CDD as appropriate based on such monitoring for the purpose of the identification and reporting of suspicious activity. As with the first and second elements, FinCEN asserts that this element of the CDD Proposal is consistent with existing regulatory compliance obligations (e.g., requirements contained in the AML and suspicious activity reporting rules), and would not impose any new or additional requirements. In addition to the issues identified above on which comment has been requested, FinCEN has posed a variety of additional questions that are designed to assist FinCEN in better understanding what types of CDD information are currently collected, specifically in relation to beneficial ownership information, and under what circumstances the information is collected. These questions ask financial institutions to address, among other things, issues that may arise in the context of implementing the CDD Proposal, including any impact

on consumers and customers, and the processes through which institutions currently obtain beneficial ownership information. David Cohen, US DoT undersecretary for terrorism and financial intelligence, said recently that he expects the final rules to be released very shortly, but also suggested beneficial owner rules would require different degrees of inquiry in different circumstances. "There is a recognition that the financial sector is complex, and one-size-fits-all is not suitable here."

2013 - Switzerland - Federal Act on War Materials⁷⁷
Following Switzerland's ratification of the Convention on Cluster Munitions (known as the Oslo convention of 2010) in 2012, Switzerland has updated existing law banking involvement in War Materials including Nuclear, Biological and Chemical and extending this to the use, stockpiling, production and transfer of cluster munitions and anti-personnel mines because of their indiscriminate impact on civilian populations during and after armed conflict and bans direct and indirect financing of all these controversial weapons. UBS welcomed Switzerland's ratification of the Convention on Cluster Munitions. We announced at the time that we would be carefully analyzing the changes, which were to be made to Swiss law, and would amend our policies accordingly. Consequently, Swiss companies including Financial Institutions as well as their subsidiaries and affiliates anywhere in the world are not allowed to provide credit facilities, capital market transactions as well as buying and holding equity and/or bonds (including derivatives) of companies that are involved in the development, production or purchase of these controversial weapons. The revisions are likely to come into effect on 1st February, 2013.

2013 - Switzerland - Money Laundering Act - Proposed implementation of (a) FATF recommendations and (b) Financial Market Strategy⁷⁸

These proposals are a response to the FATF revised recommendations and provide that Swiss banks will in future have to refuse money from clients if they suspect that it has not been taxed, under proposals put forward by the government as part of measures to preserve the country's "integrity" as a financial centre. Also, people wanting to purchase real estate or luxury goods will not be able to pay more than CHF100,000 (US\$107,400) in cash, except through a regulated financial firm. Switzerland has proposed two new laws revising and updating existing laws on money laundering. The first takes account of new FATF requirements on combating money laundering and terrorist financing in the classic criminal sense. The second is to extend due diligence requirements to prevent untaxed assets from being accepted by financial intermediaries in Switzerland. For both proposals the consultation procedure is finished since 1 July 2013. The key points provided for in the proposed Law for implementing the FATF recommendations are the: Introduction of a disclosure obligation for holders of bearer and registered shares of

unlisted companies in order to enhance the transparency of legal entities, and the extension of the due diligence requirement for establishing the identity of beneficial owners, including identifying beneficial owners of operating companies above 25%; the duty to verify identity and risk-based due diligence requirements for politically exposed persons in Switzerland ("domestic" PEP's) and international organisations ("PEP's international Organisations"); and the introduction of a new predicate offence to money laundering in the form of qualified tax fraud in the area of direct taxation and an extension of the existing predicate offence in the area of indirect taxation. It was also proposed to move to an obligation to report suspicious transactions only (altering the existing dual right and obligation regime and removing therefore the right to report going forward). However, based on the input received in the course of the consultation procedure, the dual reporting system will be kept and the right to report will not be abolished. The proposal also changes the regime about blocking accounts. Once a SAR is filed the account is only blocked if the FIU sends the SAR for further investigation and as such notifies the Bank. It is thought that the Swiss may establish a threshold for tax fraud of CHF 200,000 illegitimate gains in order for this to qualify as a crime for money laundering purposes and would include the use of forged documents or deception of tax authorities for the purpose of tax evasion. Perhaps of particular interest is a new requirement targeting purchases of real estate and goods using cash, where these are to be prohibited if over CHF100,000, alternatively if larger these must be processed via a regulated financial intermediary. Finally, the effectiveness of the reporting system is to be increased and the procedures for financial firms to be simplified. In line with Switzerland's publicized intent on pursuing its financial market "Weissgeld" or "Whitemoney" strategy, a new proposed law requires regulated financial firms to operate a risk based approach to prevent the acceptance of untaxed assets, with indicators or red flags identified, for example: they can arise, from a client's wish for greater discretion or for investments to be carried out in an overly complex structure without any reasonable justification. The law likewise sets out indicators of situations where regulated financial firms can assume risks are reduced, for example if there is an international double taxation agreement between the client's country of domicile and Switzerland. Whilst the proposed new law does not mandate the use of a client self declaration a so called "Form T", where the Swiss Government has earlier announced that it was against introducing a widespread self declaration obligation, such an approach is still recognised as being capable of constituting a strong indicator of tax-compliant behaviour. The details are to be set out in self-regulation provisions that have to be recognised as a minimum standard by the supervisory authority. If the risk-based assessment reveals suspicions of a lack of tax compliance, regulated financial firms will have to refuse to accept assets in the future. If in the case of an existing client a change in behaviour, for

example, prompts justified suspicions that the client's assets are not tax-compliant, the regulated financial firm will have to ask the client to provide proof of tax compliance within a reasonable timeframe given the circumstances. If the client is unable to supply proof, the business relationship is ultimately to be terminated. The next phase is that the respective legal amendments will be submitted to the Swiss Parliament by the end of 2013. However, in the context of ongoing international initiatives and discussions, in particular on tax matters, further legislative action is unlikely, so that the so called Swiss Financial Market Place White Money Strategy will remain as a proposal until clarification and agreement is reached on the future of automatic exchange of information.

2013 - UN - The Arms Trade Treaty (ATT)⁷⁹
The ATT was adopted by the UN General Assembly in April 2013 and is part of a larger global effort begun in 2001 with the adoption of a non-legally binding programme of action at the UN Conference on the Illicit Trade in Small Arms and Light Weapons. This programme was formally called the "Programme of Action to Prevent, Combat and Eradicate the Illicit Trade in Small Arms and Light Weapons in All Its Aspects" (PoA). The ATT establishes common international standards for the import, export and transfer of conventional arms. On behalf of the EU, Finland highlighted the support for the effort when it said, "everyday, everywhere, people are affected by the side effects of irresponsible arms transfers... As there is currently no comprehensive internationally binding instrument available to provide an agreed regulatory framework for this activity, the EU welcomes the growing support, in all parts of the world, for an ATT."

2013 - Singapore - Corruption, Drug Trafficking and Other Serious Crimes (Confiscation of Benefits) Act⁸⁰
As Singapore has grown into the world's fourth-biggest offshore financial centre, with more than US\$1.3 trillion in assets under management at the end of 2011 coming from overseas, and 50% growth in the five years to 2011, according to the latest government data, it has taken pre-emptive action to avoid criticism from other members of the OECD and implemented legislation and other measures to address new FATF requirements to include tax evasion as a predicate offence to money laundering. Starting from July 1, 2013, wilful and fraudulent tax evasion are included as serious tax crimes, and money laundering offences, which involve omissions, falsifications or fraudulent conduct perpetrated with wilful intent to evade tax or to assist others in evading tax. Before 1 July all financial institutions in Singapore must identify accounts they strongly suspect hold proceeds of fraudulent or wilful tax evasion and, where necessary, close them. After that, handling the proceeds of tax crimes will be a criminal offence. Still banks do not have to check that their clients are fully compliant with all their tax obligations, instead they must check if there are reasons to suspect the accounts contain the proceeds of serious tax offences

such as fraudulent or wilful tax evasion. As a result and in addition to scrubbing existing client files, banks will be expected going forward to develop and implement policies, controls and procedures to effectively detect and deter the laundering of proceeds from wilful or fraudulent tax evasion, to supplement existing client acceptance and ongoing transactions monitoring with tax-specific red flag indicators, as well as establishing proper escalation and investigation including Suspicious activity reporting procedures and educating and training employees. Both the Singapore Regulator the MAS and the recently issued Singapore Private Banking Code of Conduct for Client refers to possible red-flag indicators of tax crimes including: the use of complex structures or reliable negative tax-related reports on the client or on the client's jurisdiction of domicile or tax residence; the request and or use of holdmail services and or the non-collection over an extended period of hold mail without satisfactory reasons; non-face-to-face business relationships as well as other more generic AML red-flags such as suspicious and/or unusual or unexpected behaviour or activity.

2013 - BIS - Basel Committee on Banking Supervision - "Sound management of risks related to money laundering and financing of terrorism" - consultative document⁸¹

The BCBS has published updated advice on anti-money laundering (AML) and combating terrorist financing (CFT) best practice. The consultative document, released in June gives recommendations for AML/CFT risk management for banks, banking groups and supervisors. The BCBS suggests that recent "robust enforcement action" taken against a number of banks for AML failings "could probably have been avoided had the banks maintained effective risk-based policies". The Basel Committee has been offering advice on AML since 1988. The latest document provides updated recommendations for banks on how best to implement controls including for the first time details about the need for risk assessments, effective monitoring, good governance, strong IT systems and "three lines of defence" from staff in the front office, the chief AML officer and internal audits. The document goes on to assess problems that may arise for banking groups with cross-border operations. "Given the risks, each group should develop group-wide AML/CFT policies and procedures consistently applied and supervised across the group," the document says. This, the Basel Committee says, should include efforts to meet recommendations set out by the Financial Action Task Force, an intergovernmental AML body. In particular, banking groups should ensure "robust information sharing" between the head office and any branches and subsidiaries. However, such information sharing is not necessarily straightforward, as some jurisdictions restrict the sharing of customer information between the bank and group levels. In such cases, the Committee urged the jurisdictions to either change the rules, or ensure that banks were exempted.

Financial Action Task Force/FATF

FATF Work in 2013 (end Q2)

FATF issued in June 2013, the following 4 papers: 1) International Best Practices: Targeted Financial Sanctions Related to Terrorism and Terrorist Financing (Recommendation 6); this paper provides best practices which will help countries in their

implementation of the targeted financial sanctions regimes to comply with the UN Security Council Resolutions (UNSCR) relating to the prevention and suppression of terrorism and terrorist financing; 2) Guidance on Politically Exposed Persons (Recommendations 12 and 22); the FATF has developed guidance which will assist in the effective implementation of AML/CFT measures to business relationships with Politically Exposed Persons (PEPs). Many PEPs hold positions that can be abused for the purpose of laundering illicit funds or other predicate offences; 3) Guidance: The Implementation of Financial Provisions of UN Security Council Resolutions to Counter the Proliferation of Weapons of Mass Destruction; the FATF guidance assists countries in implementing not only targeted financial sanctions, but also other measures, such as activity-based financial prohibitions and vigilance measures; and 4) Guidance for a Risk-Based Approach to Prepaid Cards, Mobile Payments and Internet-Based Payment Services; where New and innovative payment products and services are being developed and used at an ever-increasing pace, some have the potential of being used for money laundering or terrorist financing. This guidance examines how these payment products and services work, and how to develop and implement AML/CFT measures in line with the risk-based approach.

The FATF updated its lists of jurisdictions (i) with strategic anti-money laundering and combating the financing of terrorism (AML/CFT) deficiencies and (ii) Jurisdictions with strategic AML/CFT deficiencies for which they have developed an action plan with the FATF (see Part 1; Sub-section 4 Country Risk for details). Whilst there had been threats that Turkey would be suspended from its FATF membership following the October 2012 FATF meeting, Turkey was not in fact suspended due to

improvements made in the interim. For details see Part 1, Section 3, Sub-section 4 above.

FATF issued its Methodology for Assessing Technical Compliance with the FATF Recommendations and the Effectiveness of AML/CFT Systems.¹ FATF have identified a High-Level Objective: Financial systems and the broader economy are protected from the threats of money laundering and the financing of terrorism and proliferation, thereby strengthening financial sector integrity and contributing to safety and security and this is supported by 11 outcomes in order to identify and measure "Effectiveness". These include (i) Money laundering and terrorist financing risks are understood and, where appropriate, actions coordinated domestically to combat money laundering and the financing of terrorism and proliferation; (ii) International cooperation delivers appropriate information, financial intelligence, and evidence, and facilitates action against criminals and their assets; (iii) Supervisors appropriately supervise, monitor and regulate financial institutions and DNFBPs for compliance with AML/CFT requirements commensurate with their risks; (iv) Financial institutions and DNFBPs adequately apply AML/CFT preventive measures commensurate with their risks, and report suspicious transactions; (v) Legal persons and arrangements are prevented from misuse for money laundering or terrorist financing, and information on their beneficial ownership is available to competent authorities without impediments; (vi) Financial intelligence and all other relevant information are appropriately used by competent authorities for money laundering and terrorist financing investigations; (vii) Money laundering offences and activities are investigated and offenders are prosecuted and subject to effective, proportionate and dissuasive sanctions; (viii) Proceeds and instrumentalities of crime are confiscated; (ix) Terrorist financing offences and activities are investigated and persons who finance terrorism are prosecuted and subject to effective, proportionate and dissuasive sanctions; (x) Terrorists, terrorist organisations and terrorist financiers are prevented from raising, moving and using funds, and from abusing the NPO sector; (xi) Persons and entities involved in the proliferation of weapons of mass destruction are prevented from raising, moving and using funds, consistent with the relevant UNSCRs.

For each outcome there are a choice of four ratings, (i) High Level of Effectiveness; (ii) Substantial Level of Effectiveness; (iii) Moderate Level of Effectiveness; (iv) Low Level of Effectiveness. Assessments should also make recommendations where appropriate in order to improve Effectiveness. First countries to be evaluated under the new system are Spain and Singapore.

FATF also updated the Guidance on Anti-Money Laundering and Counter Terrorist Financing Measures and Financial Inclusion² and approved and published guidance on conducting National Risk Assessment.

FATF also discussed the global challenges in supervision and enforcement. The plenary received and discussed presentations from US and UK representatives on the current state of compliance and of the supervision and enforcement of AML/CFT standards. Analyses of the experiences will be included in FATF's work on effectiveness. The FATF agreed to have regular discussions of this important issue.

FATF Work in 2012

In February, 2012 FATF issued their updated set of International standards on combatting money laundering and the financing of terrorism and proliferation with the release of the revised 40 Recommendations, with the most important changes being as follows:

a) **The Risk-based approach:** Countries need to clearly understand the money laundering and terrorist financing risks which affect them, and adapt their anti-money laundering/countering the financing of terrorism (AML/CFT) system to the nature of these risks – by applying enhanced measures where the risks are higher with the option of simplified measures where the risks are lower. The FATF has established the risk-based approach which will enable countries and financial intermediaries to target their resources more effectively. A well-implemented risk-based approach means that the AML/CFT system will be more effective, and will help countries implement measures to encourage financial inclusion, as called for by the G20.

b) **Transparency:** Lack of transparency about the ownership and control of legal persons and legal arrangements, or about the parties to wire transfers, makes those instruments vulnerable to misuse by criminals and terrorists. The FATF has strengthened transparency requirements in these areas. This means requiring that there is reliable information available about the beneficial ownership and control of companies, trusts, and other legal persons or legal arrangements. It also means more rigorous requirements on the information which must accompany wire transfers. Measures to improve transparency, implemented on a global basis, will make it harder for criminals and terrorists to conceal their activities.

c) **International Cooperation:** With the increasing globalisation of money laundering and terrorist financing threats, the FATF has also enhanced the scope

and application of international cooperation between authorities. The revised Recommendations will mean more effective exchanges of information for investigative, supervisory and prosecutorial purposes. This will also assist countries in tracing, freezing, and confiscating illegal assets.

d) **Operational Standards:** The FATF Recommendations concerned with law enforcement and Financial Intelligence Units have been expanded significantly. The revisions clarify the role and functions of the operational agencies responsible for combating money laundering and terrorist financing and set out the range of investigative techniques and powers which should be available to them, e.g., to obtain and analyse financial information about a suspected criminal's accounts and transactions

e) **New Threats & New Priorities:** The FATF is addressing new and aggravated threats and responding to the priorities set out by the international community, e.g. through the G20. The key issues addressed are:

- **Financing of Proliferation** - The proliferation of weapons of mass destruction is a significant security concern, and financial measures can be an effective way to combat this threat. The FATF has adopted a new Recommendation aimed at ensuring consistent and effective implementation of targeted financial sanctions when these are called for by the UN Security Council.

- **Corruption & Politically Exposed Persons** - The FATF Recommendations strengthen the requirements on financial institutions to identify politically exposed persons (PEPs) – who may represent a higher risk of corruption by virtue of the positions they hold. The existing requirement to apply enhanced due diligence to PEPs has been extended from foreign PEPs, with new risk-based requirements applied to domestic PEPs and PEPs from international organisations, and to the family and close associates of all PEPs – reflecting the methods used by corrupt officials and kleptocrats to launder the proceeds of corruption.

- **Tax Crimes** - The list of predicate offences for money laundering has been expanded to include serious tax crimes. This will bring the proceeds of tax crimes within the scope of the powers and authorities used to investigate money laundering. The smuggling offence has also been clarified to include offences relating to customs and excise duties and taxes. This will contribute to better coordination between law enforcement, border and tax authorities, and remove potential obstacles to international cooperation regarding tax crimes.

f) Terrorist Financing – The financing of terrorism remains a serious concern for the international community, and remains a major focus of the FATF Standards. The FATF's nine Special Recommendations on terrorist financing have been integrated fully within the Forty Recommendations, reflecting both the fact that terrorist financing is a long-standing concern, and the close connections between anti-money laundering measures and measures to counter the financing of terrorism.

g) Clarifying obligations: The FATF has updated its Recommendations to reflect practices in the financial sector (e.g., to set out clearer requirements for financial groups) and to apply the experience gained from the implementation of the FATF Recommendations by countries (e.g., by clarifying customer due-diligence requirements where countries have had practical difficulties with implementation).

International Standards on Combating Money Laundering and the Financing of Terrorism & Proliferation - The FATF Recommendations³

Note: *denotes the availability of Interpretative Notes.

A. AML/CFT POLICIES AND COORDINATION

1. Assessing risks and applying a risk-based approach*

Countries should identify, assess, and understand the money laundering and terrorist financing risks for the country, and should take action, including designating an authority or mechanism to coordinate actions to assess risks, and apply resources, aimed at ensuring the risks are mitigated effectively. Based on that assessment, countries should apply a risk-based approach (RBA) to ensure that measures to prevent or mitigate money laundering and terrorist financing are commensurate with the risks identified. This approach should be an essential foundation to efficient allocation of resources across the anti-money laundering and countering the financing of terrorism (AML/CFT) regime and the implementation of risk-based measures throughout the FATF Recommendations. Where countries identify higher risks, they should ensure that their AML/CFT regime adequately addresses such risks. Where countries identify lower risks, they may decide to allow simplified measures for some of the FATF Recommendations under certain conditions.

Countries should require financial institutions and designated non-financial businesses and professions (DNFBPs) to identify, assess and take effective action to mitigate their money laundering and terrorist financing risks.

2. National cooperation and coordination

Countries should have national AML/CFT policies, informed by the risks identified, which should be regularly reviewed, and should designate an authority or have a coordination or other mechanism that is responsible for such policies. Countries should ensure that policy-makers, the financial intelligence unit (FIU), law enforcement authorities, supervisors and other relevant competent authorities, at the policymaking and operational levels, have effective mechanisms in place which enable them to cooperate, and, where appropriate, coordinate domestically with each other concerning the development and implementation of policies and activities to combat money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction.

B. MONEY LAUNDERING AND CONFISCATION

3. Money laundering offence*

Countries should criminalise money laundering on the basis of the Vienna Convention and the Palermo Convention. Countries should apply the crime of money laundering to all serious offences, with a view to including the widest range of predicate offences.

4. Confiscation and provisional measures *

Countries should adopt measures similar to those set forth in the Vienna Convention, the Palermo Convention, and the Terrorist Financing Convention, including legislative measures, to enable their competent authorities to freeze or seize and confiscate the following, without prejudicing the rights of bona fide third parties:

- (a) property laundered;
- (b) proceeds from, or instrumentalities used in or intended for use in money laundering or predicate offences;
- (c) property that is the proceeds of, or used in, or intended or allocated for use in, the financing of terrorism, terrorist acts or terrorist organisations, or
- (d) property of corresponding value.

Such measures should include the authority to:

- (a) identify, trace and evaluate property that is subject to confiscation;
- (b) carry out provisional measures, such as freezing and seizing, to prevent any dealing, transfer or disposal of such property;
- (c) take steps that will prevent or void actions that prejudice the country's ability to freeze or seize or recover property that is subject to confiscation; and
- (d) take any appropriate investigative measures.

Countries should consider adopting measures that allow

such proceeds or instrumentalities to be confiscated without requiring a criminal conviction (non-conviction based confiscation), or which require an offender to demonstrate the lawful origin of the property alleged to be liable to confiscation, to the extent that such a requirement is consistent with the principles of their domestic law.

C. TERRORIST FINANCING AND FINANCING OF PROLIFERATION

5. Terrorist financing offence*

Countries should criminalise terrorist financing on the basis of the Terrorist Financing Convention, and should criminalise not only the financing of terrorist acts but also the financing of terrorist organisations and individual terrorists even in the absence of a link to a specific terrorist act or acts. Countries should ensure that such offences are designated as money laundering predicate offences.

6. Targeted financial sanctions related to terrorism and terrorist financing*

Countries should implement targeted financial sanctions regimes to comply with UN Security Council Resolutions relating to the prevention and suppression of terrorism and terrorist financing. The resolutions require countries to freeze without delay the funds or other assets of, and to ensure that no funds or other assets are made available, directly or indirectly, to or for the benefit of, any person or entity either (i) designated by, or under the authority of, the UN Security Council under Chapter VII of the Charter of the UN, including in accordance with resolution 1267 (1999) and its successor resolutions; or (ii) designated by that country pursuant to resolution 1373 (2001).

7. Targeted financial sanctions related to proliferation*

Countries should implement targeted financial sanctions to comply with UN Security Council Resolutions relating to the prevention, suppression and disruption of proliferation of weapons of mass destruction and its financing. These resolutions require countries to freeze without delay the funds or other assets of, and to ensure that no funds and other assets are made available, directly or indirectly, to or for the benefit of, any person or entity designated by, or under the authority of, the UN Security Council under Chapter VII of the Charter of the UN.

8. Non-profit organisations*

Countries should review the adequacy of laws and regulations that relate to entities that can be abused for the financing of terrorism. Non-profit organisations are

particularly vulnerable, and countries should ensure that they cannot be misused:

- (a) by terrorist organisations posing as legitimate entities;
- (b) to exploit legitimate entities as conduits for terrorist financing, including for the purpose of escaping asset-freezing measures; and
- (c) to conceal or obscure the clandestine diversion of funds intended for legitimate purposes to terrorist organisations.

D. PREVENTIVE MEASURES

9. Financial institution secrecy laws

Countries should ensure that financial institution secrecy laws do not inhibit implementation of the FATF Recommendations.

CUSTOMER DUE DILIGENCE AND RECORD-KEEPING

10. Customer due diligence*

Financial institutions should be prohibited from keeping anonymous accounts or accounts in obviously fictitious names. Financial institutions should be required to undertake customer due diligence (CDD) measures when: (i) establishing business relations; (ii) carrying out occasional transactions:

- (i) above the applicable designated threshold (US\$/EUR 15,000); or
- (ii) that are wire transfers in the circumstances covered by the Interpretive Note to Recommendation 16;
- (iii) there is a suspicion of money laundering or terrorist financing; or
- (iv) the financial institution has doubts about the veracity or adequacy of previously obtained customer identification data.

The principle that financial institutions should conduct CDD should be set out in law. Each country may determine how it imposes specific CDD obligations, either through law or enforceable means. The CDD measures to be taken are as follows:

- (a) Identifying the customer and verifying that customer's identity using reliable, independent source documents, data or information.
- (b) Identifying the beneficial owner, and taking reasonable measures to verify the identity of the beneficial owner, such that the financial institution is satisfied that it knows who the beneficial owner is. For legal persons and arrangements this should include financial institutions understanding the ownership and control structure

of the customer.

(c) Understanding and, as appropriate, obtaining information on the purpose and intended nature of the business relationship.

(d) Conducting ongoing due diligence on the business relationship and scrutiny of transactions undertaken throughout the course of that relationship to ensure that the transactions being conducted are consistent with the institution's knowledge of the customer, their business and risk profile, including, where necessary, the source of funds.

Financial institutions should be required to apply each of the CDD measures under (a) to (d) above, but should determine the extent of such measures using a risk-based approach (RBA) in accordance with the Interpretive Notes to this Recommendation and to Recommendation 1. Financial institutions should be required to verify the identity of the customer and beneficial owner before or during the course of establishing a business relationship or conducting transactions for occasional customers. Countries may permit financial institutions to complete the verification as soon as reasonably practicable following the establishment of the relationship, where the money laundering and terrorist financing risks are effectively managed and where this is essential not to interrupt the normal conduct of business.

Where the financial institution is unable to comply with the applicable requirements under paragraphs (a) to (d) above (subject to appropriate modification of the extent of the measures on a risk-based approach), it should be required not to open the account, commence business relations or perform the transaction; or should be required to terminate the business relationship; and should consider making a suspicious transactions report in relation to the customer.

These requirements should apply to all new customers, although financial institutions should also apply this Recommendation to existing customers on the basis of materiality and risk, and should conduct due diligence on such existing relationships at appropriate times.

11. Record-keeping

Financial institutions should be required to maintain, for at least five years, all necessary records on transactions, both domestic and international, to enable them to comply swiftly with information requests from the competent authorities. Such records must be sufficient to permit reconstruction of individual transactions (including the amounts and types of currency involved, if any) so as to provide, if necessary, evidence for prosecution of criminal activity.

Financial institutions should be required to keep all records obtained through CDD measures (e.g. copies or records of official identification documents like passports, identity cards, driving licences or similar documents), account files and business correspondence, including the results of any analysis undertaken (e.g. inquiries to establish the background and purpose of complex, unusual large transactions), for at least five years after the business relationship is ended, or after the date of the occasional transaction.

Financial institutions should be required by law to maintain records on transactions and information obtained through the CDD measures. The CDD information and the transaction records should be available to domestic competent authorities upon appropriate authority.

ADDITIONAL MEASURES FOR SPECIFIC CUSTOMERS AND ACTIVITIES

12. Politically exposed persons*

Financial institutions should be required, in relation to foreign politically exposed persons (PEPs) (whether as customer or beneficial owner), in addition to performing normal customer due diligence measures, to:

- (a) have appropriate risk-management systems to determine whether the customer or the beneficial owner is a politically exposed person;
- (b) obtain senior management approval for establishing (or continuing, for existing customers) such business relationships;
- (c) take reasonable measures to establish the source of wealth and source of funds; and
- (d) conduct enhanced ongoing monitoring of the business relationship.

Financial institutions should be required to take reasonable measures to determine whether a customer or beneficial owner is a domestic PEP or a person who is or has been entrusted with a prominent function by an international organisation. In cases of a higher risk business relationship with such persons, financial institutions should be required to apply the measures referred to in paragraphs (b), (c) and (d).

The requirements for all types of PEP should also apply to family members or close associates of such PEPs.

13. Correspondent banking*

Financial institutions should be required, in relation to cross-border correspondent banking and other similar relationships, in addition to performing normal customer due diligence measures, to:

- (a) gather sufficient information about a respondent institution to understand fully the nature of the respondent's business and to determine from publicly available information the reputation of the institution and the quality of supervision, including whether it has been subject to a money laundering or terrorist financing investigation or regulatory action;
- (b) assess the respondent institution's AML/CFT controls;
- (c) obtain approval from senior management before establishing new correspondent relationships;
- (d) clearly understand the respective responsibilities of each institution; and
- (e) with respect to "payable-through accounts", be satisfied that the respondent bank has conducted CDD on the customers having direct access to accounts of the correspondent bank, and that it is able to provide relevant CDD information upon request to the correspondent bank.

Financial institutions should be prohibited from entering into, or continuing, a correspondent banking relationship with shell banks. Financial institutions should be required to satisfy themselves that respondent institutions do not permit their accounts to be used by shell banks.

14. Money or value transfer services*

Countries should take measures to ensure that natural or legal persons that provide money or value transfer services (MVTs) are licensed or registered, and subject to effective systems for monitoring and ensuring compliance with the relevant measures called for in the FATF Recommendations. Countries should take action to identify natural or legal persons that carry out MVTs without a license or registration, and to apply appropriate sanctions.

Any natural or legal person working as an agent should also be licensed or registered by a competent authority, or the MVT provider should maintain a current list of its agents accessible by competent authorities in the countries in which the MVT provider and its agents operate. Countries should take measures to ensure that MVT providers that use agents include them in their AML/CFT programmes and monitor them for compliance with these programmes.

15. New technologies

Countries and financial institutions should identify and assess the money laundering or terrorist financing risks that may arise in relation to

- (a) the development of new products and new business practices, including new delivery mechanisms, and
- (b) the use of new or developing technologies for both

new and pre-existing products. In the case of financial institutions, such a risk assessment should take place prior to the launch of the new products, business practices or the use of new or developing technologies. They should take appropriate measures to manage and mitigate those risks.

16. Wire transfers*

Countries should ensure that financial institutions include required and accurate originator information, and required beneficiary information, on wire transfers and related messages, and that the information remains with the wire transfer or related message throughout the payment chain.

Countries should ensure that financial institutions monitor wire transfers for the purpose of detecting those which lack required originator and/or beneficiary information, and take appropriate measures.

Countries should ensure that, in the context of processing wire transfers, financial institutions take freezing action and should prohibit conducting transactions with designated persons and entities, as per the obligations set out in the relevant UN Security Council resolutions, such as resolution 1267 (1999) and its successor resolutions, and resolution 1373(2001), relating to the prevention and suppression of terrorism and terrorist financing.

RELIANCE, CONTROLS AND FINANCIAL GROUPS

17. Reliance on third parties*

Countries may permit financial institutions to rely on third parties to perform elements (a)-(c) of the CDD measures set out in Recommendation 10 or to introduce business, provided that the criteria set out below are met. Where such reliance is permitted, the ultimate responsibility for CDD measures remains with the financial institution relying on the third party.

The criteria that should be met are as follows:

- (a) A financial institution relying upon a third party should immediately obtain the necessary information concerning elements (a)-(c) of the CDD measures set out in Recommendation 10.
- (b) Financial institutions should take adequate steps to satisfy themselves that copies of identification data and other relevant documentation relating to the CDD requirements will be made available from the third party upon request without delay.
- (c) The financial institution should satisfy itself that the third party is regulated, supervised or monitored for,

and has measures in place for compliance with, CDD and record-keeping requirements in line with Recommendations 10 and 11.

(d) When determining in which countries the third party that meets the conditions can be based, countries should have regard to information available on the level of country risk.

When a financial institution relies on a third party that is part of the same financial group, and (i) that group applies CDD and record-keeping requirements, in line with Recommendations 10, 11 and 12, and programmes against money laundering and terrorist financing, in accordance with Recommendation 18; and (ii) where the effective implementation of those CDD and record-keeping requirements and AML/CFT programmes is supervised at a group level by a competent authority, then relevant competent authorities may consider that the financial institution applies measures under (b) and (c) above through its group programme, and may decide that (d) is not a necessary precondition to reliance when higher country risk is adequately mitigated by the group AML/CFT policies.

18. Internal controls and foreign branches and subsidiaries*

Financial institutions should be required to implement programmes against money laundering and terrorist financing. Financial groups should be required to implement groupwide programmes against money laundering and terrorist financing, including policies and procedures for sharing information within the group for AML/CFT purposes. Financial institutions should be required to ensure that their foreign branches and majority-owned subsidiaries apply AML/CFT measures consistent with the home country requirements implementing the FATF Recommendations through the financial groups' programmes against money laundering and terrorist financing.

19. Higher-risk countries*

Financial institutions should be required to apply enhanced due diligence measures to business relationships and transactions with natural and legal persons, and financial institutions, from countries for which this is called for by the FATF. The type of enhanced due diligence measures applied should be effective and proportionate to the risks. Countries should be able to apply appropriate countermeasures when called upon to do so by the FATF. Countries should also be able to apply countermeasures independently of any call by the FATF to do so. Such countermeasures should be effective and proportionate to the risks.

REPORTING OF SUSPICIOUS TRANSACTIONS

20. Reporting of suspicious transactions*

If a financial institution suspects or has reasonable grounds to suspect that funds are the proceeds of a criminal activity, or are related to terrorist financing, it should be required, by law, to report promptly its suspicions to the financial intelligence unit (FIU).

21. Tipping-off and confidentiality

Financial institutions, their directors, officers and employees should be:

- (a) protected by law from criminal and civil liability for breach of any restriction on disclosure of information imposed by contract or by any legislative, regulatory or administrative provision, if they report their suspicions in good faith to the FIU, even if they did not know precisely what the underlying criminal activity was, and regardless of whether illegal activity actually occurred;
- (b) prohibited by law from disclosing ("tipping-off") the fact that a suspicious transaction report (STR) or related information is being filed with the FIU.

DESIGNATED NON-FINANCIAL BUSINESSES AND PROFESSIONS

22. DNFBPs: customer due diligence*

The customer due diligence and record-keeping requirements set out in Recommendations 10, 11, 12, 15, and 17, apply to designated non-financial businesses and professions (DNFBPs) in the following situations:

- (a) Casinos – when customers engage in financial transactions equal to or above the applicable designated threshold.
- (b) Real estate agents – when they are involved in transactions for their client concerning the buying and selling of real estate.
- (c) Dealers in precious metals and dealers in precious stones – when they engage in any cash transaction with a customer equal to or above the applicable designated threshold.
- (d) Lawyers, notaries, other independent legal professionals and accountants – when they prepare for or carry out transactions for their client concerning the following activities:
 - buying and selling of real estate;
 - managing of client money, securities or other assets;
 - management of bank, savings or securities accounts;
 - organisation of contributions for the creation, operation or management of companies;

- creation, operation or management of legal persons or arrangements, and buying and selling of business entities.

(e) Trust and company service providers – when they prepare for or carry out transactions for a client concerning the following activities:

- acting as a formation agent of legal persons;
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- providing a registered office, business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement;
- acting as (or arranging for another person to act as) a nominee shareholder for another person.

23. DNFBPs: Other measures*

The requirements set out in Recommendations 18 to 21 apply to all designated non-financial businesses and professions, subject to the following qualifications:

- (a) Lawyers, notaries, other independent legal professionals and accountants should be required to report suspicious transactions when, on behalf of or for a client, they engage in a financial transaction in relation to the activities described in paragraph (d) of Recommendation 22. Countries are strongly encouraged to extend the reporting requirement to the rest of the professional activities of accountants, including auditing.
- (b) Dealers in precious metals and dealers in precious stones should be required to report suspicious transactions when they engage in any cash transaction with a customer equal to or above the applicable designated threshold.
- (c) Trust and company service providers should be required to report suspicious transactions for a client when, on behalf of or for a client, they engage in a transaction in relation to the activities referred to in paragraph (e) of Recommendation 22.

E. TRANSPARENCY AND BENEFICIAL OWNERSHIP OF LEGAL PERSONS AND ARRANGEMENTS

24. Transparency and beneficial ownership of legal persons*

Countries should take measures to prevent the misuse of legal persons for money laundering or terrorist financing. Countries should ensure that there is adequate, accurate and timely information on the beneficial ownership and control of legal persons that can be obtained or accessed in a timely fashion by competent authorities. In particular, countries that have legal persons that are able to issue bearer shares or bearer share warrants, or which allow nominee shareholders or nominee directors, should take effective measures to ensure that they are not misused for money laundering or terrorist financing. Countries should consider measures to facilitate access to beneficial ownership and control information by financial institutions and DNFBPs undertaking the requirements set out in Recommendations 10 and 22.

25. Transparency and beneficial ownership of legal arrangements*

Countries should take measures to prevent the misuse of legal arrangements for money laundering or terrorist financing. In particular, countries should ensure that there is adequate, accurate and timely information on express trusts, including information on the settlor, trustee and beneficiaries, that can be obtained or accessed in a timely fashion by competent authorities. Countries should consider measures to facilitate access to beneficial ownership and control information by financial institutions and DNFBPs undertaking the requirements set out in Recommendations 10 and 22.

F. POWERS AND RESPONSIBILITIES OF COMPETENT AUTHORITIES, AND OTHER INSTITUTIONAL MEASURES REGULATION AND SUPERVISION

26. Regulation and supervision of financial institutions *

Countries should ensure that financial institutions are subject to adequate regulation and supervision and are effectively implementing the FATF Recommendations. Competent authorities or financial supervisors should take the necessary legal or regulatory measures to prevent criminals or their associates from holding, or being the beneficial owner of, a significant or controlling interest, or holding a management function in, a financial institution. Countries should not approve the establishment, or continued operation, of shell banks. For financial institutions subject to the Core Principles, the regulatory and supervisory measures that apply for

prudential purposes, and which are also relevant to money laundering and terrorist financing, should apply in a similar manner for AML/CFT purposes. This should include applying consolidated group supervision for AML/CFT purposes. Other financial institutions should be licensed or registered and adequately regulated, and subject to supervision or monitoring for AML/CFT purposes, having regard to the risk of money laundering or terrorist financing in that sector. At a minimum, where financial institutions provide a service of money or value transfer, or of money or currency changing, they should be licensed or registered, and subject to effective systems for monitoring and ensuring compliance with national AML/CFT requirements.

27. Powers of supervisors

Supervisors should have adequate powers to supervise or monitor, and ensure compliance by, financial institutions with requirements to combat money laundering and terrorist financing, including the authority to conduct inspections. They should be authorised to compel production of any information from financial institutions that is relevant to monitoring such compliance, and to impose sanctions, in line with Recommendation 35, for failure to comply with such requirements. Supervisors should have powers to impose a range of disciplinary and financial sanctions, including the power to withdraw, restrict or suspend the financial institution's license, where applicable.

28. Regulation and supervision of DNFBPs*

Designated non-financial businesses and professions should be subject to regulatory and supervisory measures as set out below.

(a) Casinos should be subject to a comprehensive regulatory and supervisory regime that ensures that they have effectively implemented the necessary AML/CFT measures. At a minimum:

- casinos should be licensed;

- competent authorities should take the necessary legal or regulatory measures to prevent criminals or their associates from holding, or being the beneficial owner of, a significant or controlling interest, holding a management function in, or being an operator of, a casino; and

- competent authorities should ensure that casinos are effectively supervised for compliance with AML/CFT requirements.

(b) Countries should ensure that the other categories of DNFBPs are subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements.

This should be performed on a risk-sensitive basis. This may be performed by

(a) a supervisor or

(b) by an appropriate self-regulatory body (SRB), provided that such a body can ensure that its members comply with their obligations to combat money laundering and terrorist financing.

The supervisor or SRB should also

(a) take the necessary measures to prevent criminals or their associates from being professionally accredited, or holding or being the beneficial owner of a significant or controlling interest or holding a management function, e.g. through evaluating persons on the basis of a "fit and proper" test; and

(b) have effective, proportionate, and dissuasive sanctions in line with Recommendation 35 available to deal with failure to comply with AML/CFT requirements.

OPERATIONAL AND LAW ENFORCEMENT

29. Financial intelligence units*

Countries should establish a financial intelligence unit (FIU) that serves as a national centre for the receipt and analysis of: (a) suspicious transaction reports; and (b) other information relevant to money laundering, associated predicate offences and terrorist financing, and for the dissemination of the results of that analysis. The FIU should be able to obtain additional information from reporting entities, and should have access on a timely basis to the financial, administrative and law enforcement information that it requires to undertake its functions properly.

30. Responsibilities of law enforcement and investigative authorities*

Countries should ensure that designated law enforcement authorities have responsibility for money laundering and terrorist financing investigations within the framework of national AML/CFT policies. At least in all cases related to major proceeds-generating offences, these designated law enforcement authorities should develop a pro-active parallel financial investigation when pursuing money laundering, associated predicate offences and terrorist financing. This should include cases where the associated predicate offence occurs outside their jurisdictions. Countries should ensure that competent authorities have responsibility for expeditiously identifying, tracing and initiating actions to freeze and seize property that is, or may become, subject to confiscation, or is suspected of being proceeds of

crime. Countries should also make use, when necessary, of permanent or temporary multi-disciplinary groups specialised in financial or asset investigations. Countries should ensure that, when necessary, cooperative investigations with appropriate competent authorities in other countries take place.

31. Powers of law enforcement and investigative authorities

When conducting investigations of money laundering, associated predicate offences and terrorist financing, competent authorities should be able to obtain access to all necessary documents and information for use in those investigations, and in prosecutions and related actions. This should include powers to use compulsory measures for the production of records held by financial institutions, DNFBPs and other natural or legal persons, for the search of persons and premises, for taking witness statements, and for the seizure and obtaining of evidence.

Countries should ensure that competent authorities conducting investigations are able to use a wide range of investigative techniques suitable for the investigation of money laundering, associated predicate offences and terrorist financing. These investigative techniques include: undercover operations, intercepting communications, accessing computer systems and controlled delivery. In addition, countries should have effective mechanisms in place to identify, in a timely manner, whether natural or legal persons hold or control accounts. They should also have mechanisms to ensure that competent authorities have a process to identify assets without prior notification to the owner. When conducting investigations of money laundering, associated predicate offences and terrorist financing, competent authorities should be able to ask for all relevant information held by the FIU.

32. Cash couriers*

Countries should have measures in place to detect the physical cross-border transportation of currency and bearer negotiable instruments, including through a declaration system and/or disclosure system. Countries should ensure that their competent authorities have the legal authority to stop or restrain currency or bearer negotiable instruments that are suspected to be related to terrorist financing, money laundering or predicate offences, or that are falsely declared or disclosed. Countries should ensure that effective, proportionate and dissuasive sanctions are available to deal with persons who make false declaration(s) or disclosure(s). In cases where the currency or bearer negotiable instruments are related to terrorist financing, money laundering or predicate offences, countries should also adopt measures, including legislative ones consistent with Recommendation 4,

which would enable the confiscation of such currency or instruments.

GENERAL REQUIREMENTS

33. Statistics

Countries should maintain comprehensive statistics on matters relevant to the effectiveness and efficiency of their AML/CFT systems. This should include statistics on the STRs received and disseminated; on money laundering and terrorist financing investigations, prosecutions and convictions; on property frozen, seized and confiscated; and on mutual legal assistance or other international requests for cooperation.

34. Guidance and feedback

The competent authorities, supervisors and SRBs should establish guidelines, and provide feedback, which will assist financial institutions and designated non-financial businesses and professions in applying national measures to combat money laundering and terrorist financing, and, in particular, in detecting and reporting suspicious transactions.

SANCTIONS

35. Sanctions

Countries should ensure that there is a range of effective, proportionate and dissuasive sanctions, whether criminal, civil or administrative, available to deal with natural or legal persons covered by Recommendations 6, and 8 to 23, that fail to comply with AML/CFT requirements. Sanctions should be applicable not only to financial institutions and DNFBPs, but also to their directors and senior management.

G. INTERNATIONAL COOPERATION

36. International instruments

Countries should take immediate steps to become party to and implement fully the Vienna Convention, 1988; the Palermo Convention, 2000; the UN Convention against Corruption, 2003; and the Terrorist Financing Convention, 1999. Where applicable, countries are also encouraged to ratify and implement other relevant international conventions, such as the Council of Europe Convention on Cybercrime, 2001; the Inter-American Convention against Terrorism, 2002; and the Council of Europe Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime and on the Financing of Terrorism, 2005.

37. Mutual legal assistance

Countries should rapidly, constructively and effectively provide the widest possible range of mutual legal as-

sistance in relation to money laundering, associated predicate offences and terrorist financing investigations, prosecutions, and related proceedings. Countries should have an adequate legal basis for providing assistance and, where appropriate, should have in place treaties, arrangements or other mechanisms to enhance cooperation. In particular, countries should:

- (a) Not prohibit, or place unreasonable or unduly restrictive conditions on, the provision of mutual legal assistance.
- (b) Ensure that they have clear and efficient processes for the timely prioritisation and execution of mutual legal assistance requests. Countries should use a central authority, or another established official mechanism, for effective transmission and execution of requests. To monitor progress on requests, a case management system should be maintained.
- (c) Not refuse to execute a request for mutual legal assistance on the sole ground that the offence is also considered to involve fiscal matters.
- (d) Not refuse to execute a request for mutual legal assistance on the grounds that laws require financial institutions to maintain secrecy or confidentiality.
- (e) Maintain the confidentiality of mutual legal assistance requests they receive and the information contained in them, subject to fundamental principles of domestic law, in order to protect the integrity of the investigation or inquiry. If the requested country cannot comply with the requirement of confidentiality, it should promptly inform the requesting country.

Countries should render mutual legal assistance, notwithstanding the absence of dual criminality, if the assistance does not involve coercive actions. Countries should consider adopting such measures as may be necessary to enable them to provide a wide scope of assistance in the absence of dual criminality. Where dual criminality is required for mutual legal assistance, that requirement should be deemed to be satisfied regardless of whether both countries place the offence within the same category of offence, or denominate the offence by the same terminology, provided that both countries criminalise the conduct underlying the offence.

Countries should ensure that, of the powers and investigative techniques required under Recommendation 31, and any other powers and investigative techniques available to their competent authorities:

- (a) all those relating to the production, search and seizure of information, documents or evidence (including financial records) from financial institutions or other persons, and the taking of witness statements; and
- (b) a broad range of other powers and investigative tech-

niques; are also available for use in response to requests for mutual legal assistance, and, if consistent with their domestic framework, in response to direct requests from foreign judicial or law enforcement authorities to domestic counterparts.

To avoid conflicts of jurisdiction, consideration should be given to devising and applying mechanisms for determining the best venue for prosecution of defendants in the interests of justice in cases that are subject to prosecution in more than one country.

Countries should, when making mutual legal assistance requests, make best efforts to provide complete factual and legal information that will allow for timely and efficient execution of requests, including any need for urgency, and should send requests using expeditious means.

Countries should, before sending requests, make best efforts to ascertain the legal requirements and formalities to obtain assistance.

The authorities responsible for mutual legal assistance (e.g. a Central Authority) should be provided with adequate financial, human and technical resources. Countries should have in place processes to ensure that the staff of such authorities maintain high professional standards, including standards concerning confidentiality, and should be of high integrity and be appropriately skilled.

38. Mutual legal assistance: freezing and confiscation*

Countries should ensure that they have the authority to take expeditious action in response to requests by foreign countries to identify, freeze, seize and confiscate property laundered; proceeds from money laundering, predicate offences and terrorist financing; instrumentalities used in, or intended for use in, the commission of these offences; or property of corresponding value. This authority should include being able to respond to requests made on the basis of non-conviction-based confiscation proceedings and related provisional measures, unless this is inconsistent with fundamental principles of their domestic law. Countries should also have effective mechanisms for managing such property, instrumentalities or property of corresponding value, and arrangements for coordinating seizure and confiscation proceedings, which should include the sharing of confiscated assets.

39. Extradition

Countries should constructively and effectively execute extradition requests in relation to money laundering

and terrorist financing, without undue delay. Countries should also take all possible measures to ensure that they do not provide safe havens for individuals charged with the financing of terrorism, terrorist acts or terrorist organisations. In particular, countries should:

- (a) ensure money laundering and terrorist financing are extraditable offences;
- (b) ensure that they have clear and efficient processes for the timely execution of extradition requests including prioritisation where appropriate. To monitor progress of requests a case management system should be maintained;
- (c) not place unreasonable or unduly restrictive conditions on the execution of requests; and
- (d) ensure they have an adequate legal framework for extradition.

Each country should either extradite its own nationals, or, where a country does not do so solely on the grounds of nationality, that country should, at the request of the country seeking extradition, submit the case, without undue delay, to its competent authorities for the purpose of prosecution of the offences set forth in the request. Those authorities should take their decision and conduct their proceedings in the same manner as in the case of any other offence of a serious nature under the domestic law of that country. The countries concerned should cooperate with each other, in particular on procedural and evidentiary aspects, to ensure the efficiency of such prosecutions.

Where dual criminality is required for extradition, that requirement should be deemed to be satisfied regardless of whether both countries place the offence within the same category of offence, or denominate the offence by the same terminology, provided that both countries criminalise the conduct underlying the offence.

Consistent with fundamental principles of domestic law, countries should have simplified extradition mechanisms, such as allowing direct transmission of requests for provisional arrests between appropriate authorities, extraditing persons based only on warrants of arrests or judgments, or introducing a simplified extradition of consenting persons who waive formal extradition proceedings. The authorities responsible for extradition should be provided with adequate financial, human and technical resources. Countries should have in place processes to ensure that the staff of such authorities maintain high professional standards, including standards concerning confidentiality, and should be of high integrity and be appropriately skilled.

40. Other forms of international cooperation*

Countries should ensure that their competent authorities can rapidly, constructively and effectively provide the widest range of international cooperation in relation to money laundering, associated predicate offences and terrorist financing. Countries should do so both spontaneously and upon request, and there should be a lawful basis for providing cooperation. Countries should authorise their competent authorities to use the most efficient means to cooperate. Should a competent authority need bilateral or multilateral agreements or arrangements, such as a Memorandum of Understanding (MOU), these should be negotiated and signed in a timely way with the widest range of foreign counterparts. Competent authorities should use clear channels or mechanisms for the effective transmission and execution of requests for information or other types of assistance. Competent authorities should have clear and efficient processes for the prioritisation and timely execution of requests, and for safeguarding the information received.

FATF more work in 2012

FATF Public Statements naming and shaming Countries

Beyond the revision of the Recommendations, FATF made Public Statements first in June then updated in October about particular Countries that were effectively named and shamed, including naming North Korea and Iran where countermeasures were recommended and Turkey where FATF membership was proposed to be suspended. For more details about other Countries named see Part 2, Section 4, Country Risk above.

FATF Publications

In addition a number of other important announcements and publications were made.

FATF published its findings into the extent of **Money Laundering and Terrorist Financing vulnerabilities of the illicit tobacco trade⁴** at global, regional and domestic levels. According to FATF, the Illicit Tobacco Trade, which represents approximately one tenth of the global trade in cigarettes which is estimated at US\$40.5bio per year. In addition to its financial impact, illicit trade in tobacco also creates substantial loss of tax revenue. This FATF report analyses the extent of money laundering and terrorist financing vulnerabilities of the illicit tobacco trade at global, regional and domestic levels. The FATF also issued guidance in 2012 to help countries understand the important role of law enforcement in conducting money laundering, terrorist

financing and asset-tracing investigations. The guidance provides strategies and techniques which are intended to assist countries in increasing the effectiveness of such investigations. The Guidance is called “**Operational Issues - Financial Investigations Guidance**.” FATF also issued “**Specific Risk Factors in the Laundering of Proceeds of Corruption - Assistance to reporting institutions**”⁵ which was directed towards practitioners in the financial sector to better understand and identify the risk factors that may indicate the laundering of corruption proceeds.

Finally **G20 Finance Ministers and Central Bank Governors** reaffirmed their commitment to the FATF and issued a communique stating:⁶ “*We remain committed and encourage the FATF to continue to pursue all its objectives, and notably to continue to identify and monitor high-risk jurisdictions with strategic Anti-Money Laundering/Counter-Terrorist Financing (AML/CFT) deficiencies. We look forward to the completion in 2013 of the revision of the FATF assessment process. We encourage all countries to adapt their legal framework with a view to complying with the revised FATF’s Recommendations, in particular the necessity to identify the beneficial owner of corporate vehicles, and we look forward to the assessment of the effectiveness of the measures countries take and their compliance with the global standards in the next round of Mutual Evaluations.*”

FATF work in 2011

FATF issued 3 publications of real interest in 2011, the first, the “**Laundering the Proceeds of Corruption**”⁷ which studied the links between corruption and money laundering, key vulnerabilities within the current AML/CFT framework and some of the obstacles to the recovery of corruption; the second, “**Organised Maritime Piracy and Related Kidnapping for Ransom**”⁸ following on from a growing concern over organised piracy on the high seas and kidnapping for ransom; and finally “**Money Laundering Risks Arising from Trafficking of Human Beings and Smuggling of Migrants**”⁹ which describes the money flows related to trafficking of human beings and smuggling of migrants, and attempts to assess their scale.

FATF work in 2010

FATF issued 5 publications of real interest in 2010, the first, the “**Money Laundering Using Trust and Company Service Providers (TCSPs)**”¹⁰ was a comprehensive typologies report, then “**Money Laundering Using New Payment Methods**”¹¹ which compared the “potential risks” described in the 2006 report on New Payment Methods to the “actual risks” based on new case studies

and typologies, followed by a “**Global Money Laundering & Terrorist Financing Threat Assessment**”¹² aimed at raising the level of understanding of these threats and their negative impact, and helping governments to decide on what actions they can take; then “**Money Laundering through Money Remittance and Currency Exchange Providers**”¹³ which set out identified money laundering and terrorist financing methods and techniques involving money remittance and currency exchange providers; and finally, “**Money Laundering vulnerabilities of Free Trade Zones**”¹⁴ where concerns have been raised about illicit actors taking advantage of more relaxed oversight to launder the proceeds of crime and finance terrorism and the report highlights the vulnerabilities of free trade zones.

FATF work in 2009

FATF issued 3 publications of real interest in 2009 the first, “**Money Laundering and Terrorist Financing in the Securities Sector**”¹⁵ which studied (i) how criminals might be able to use securities firms to launder money and finance terrorism and (ii) how illicit funds can be generated through fraudulent activities; the second, “**Money Laundering through the Football Sector**”¹⁶ where several case examples of areas that could be exploited by those wanting to invest illegal money into football were described with concerns raised about the risks facing the football sector in particular and the sports industry in general to misuse by criminals; and finally “**Vulnerabilities of Casinos and Gaming Sector**”¹⁷ which included typologies and also considered vulnerabilities.

FATF issued a “Statement” on 25 February 2009 noting concerns and encouraging greater compliance by the following countries: Iran; Pakistan; Turkmenistan; Uzbekistan and São Tomé and Príncipe. For more details see Part 2, Section 4, Country Risk above.

FATF work in 2008

FATF issued 4 publications of real interest in 2008 the first a “**Typologies Report on Proliferation Financing**”¹⁸ the second, “**Money Laundering & Terrorist Financing Vulnerabilities of Commercial Websites and Internet Payment Systems**”¹⁹ then a “**Money Laundering & Terrorist Financing Risk Assessment Strategies**”²⁰ and a “**Terrorist Financing Typologies Report**”²¹.

FATF announced a successor programme to the NCCT programme which would be a different and more analytical process of identifying countries and jurisdictions displaying strategic deficiencies in their anti-money

laundering and anti-terrorist financing regimes,

FATF work in 2007

FATF issued 3 publications of real interest in 2007 the first, “**Money Laundering and Terrorist Financing Through the Real Estate Sector**”²² then “**Laundering the Proceeds of VAT Carousel Fraud Report**”²³ and “**The Misuse of Corporate Vehicles, Including Trust and Company Service Providers**”²⁴.

FATF’s final NCCT Review (Annual Review of Non-Cooperative Countries and Territories 2006–2007 dated 12 October 2007) listed no countries as non-cooperative.

FATF work in 2006

FATF issued 2 publications of real interest in 2006 the first a “**Report on New Payment Methods**”²⁵ and the second, “**Trade-Based Money Laundering**”²⁶.

The seventh NCCT list, published in June 2006, listed only Burma as non-cooperative.

FATF work in 2004

In 2004, FATF issued ‘**Combating the Abuse of Alternative Remittance Systems (SR VI) Best Practice, alternative remittance**’²⁷ which provided guidance on how to detect alternative remittance systems outside the conventional financial sector. FATF also issued ‘**Best Practice, cash couriers, bearer negotiable instruments, SR IX**’²⁸ which provided best practices for the areas that have proven most challenging.

FATF work in 2003

FATF issued its third revision of its 40/8 Recommendations.

FATF work in 2002

In 2002 FATF issued “**International Best Practices: Combating the Abuse of Non-Profit Organisations (SR VIII)**”²⁹ and “**Guidance for financial institutions in detecting terrorist financing**”³⁰ to help build awareness of how terrorists, their associates or those who support terrorism may use the financial system, this document describes the general characteristics of terrorist financing.

FATF work in 2001

In the second NCCT report issued in 2001 (including

a supplemental report later that year) a further eight countries were designated as non-cooperative: Egypt; Grenada; Guatemala; Hungary; Indonesia; Burma; Nigeria; and Ukraine. These would all ultimately be removed from the list over the coming years.³¹

FATF issued 8 Special Recommendations on Terrorist Financing.

FATF also issued a typology report on “**Behind the Corporate Veil**”.

FATF work in 2000

FATF introduced a blacklist which was published in June 2000, with fifteen countries initially appeared on the list as being regarded as uncooperative in the fight against money laundering. These included: Bahamas; Cayman Islands; Cook Islands; Dominica; Israel; Lebanon; Liechtenstein; Marshall Islands; Nauru; Niue; Panama; Philippines; Russian Federation; Saint Kitts and Nevis; and Saint Vincent and the Grenadines.³²

The FATF blacklist was the common shorthand description for the Financial Action Task Force list of “Non-Cooperative Countries or Territories” (NCCTs); that is, countries which it perceived to be non-cooperative in the global fight against money laundering and terrorist financing. The term “non-cooperative” was sometimes criticized as misleading, as a number of the countries which appeared on the list simply lacked the infrastructure or resources to cope with FATF requirements, and many considered them on the list for two main reasons. The first that they were not members of FATF and the second in that they were simply considered by some as having increased risks as so called offshore financial centres.

FATF work before 2000

1996 FATF makes its first revision of its 40 Recommendations and issues its first typology report.³³

1991 FATF members agree Mutual Assessment Process

1990 FATF issued its 40 Recommendations.³⁴

1989 FATF was established

Wolfsberg Group AML Standards & Work

In 1999 a group of international private banks,¹ with representatives from Transparency International, Professor Mark Pieth of the Basel Institute of Governance and the University of Basel and Stan Morris of Interpol, joined forces to review and compare their internal Anti-Money Laundering (AML) guidelines. The "Wolfsberg AML Principles for Private Banking," as they are now internationally known, emerged from this meeting. The name "Wolfsberg" was chosen as a brand name as a reference to the UBS Executive Development Centre at Wolfsberg, where the development meetings took place, as well as to the key role played by UBS in the establishment of this Group. The Wolfsberg Group is an association of 11 (initially 12) global banks, which aims to develop financial services industry standards, and related products, for Know Your Customer, AML and Counter Terrorist Financing policies. Current membership, besides UBS includes Banco Santander, Bank of Tokyo-Mitsubishi UFJ, Barclays, Citigroup, Credit Suisse, Deutsche Bank, Goldman Sachs, HSBC, JP Morgan Chase and Société Générale.

By any measure the importance of the Wolfsberg Group cannot be understated. The Group is made up of 11 private sector banking groups, that are present in all continents and together have a presence in most of the countries of the world. The following facts and figures, collected from public sources and/or estimated by the author, also demonstrate the importance of the Group.

Whilst the total assets of the World's Top 100 Banks is estimated at almost US\$90 trillion and the total assets of the Wolfsberg Group combined are approximately US\$20.861 trillion, with 5 in the top 10 banks by asset, 9 in the top 20 and all 11 in the top 30.²

Total market capitalisation in aggregate for the members of the Wolfsberg Group as at end-April 2013 was just over US\$1 trillion (US\$1.015 trillion).³

In the major businesses that banks are involved, in particular; Asset Management; Brokerage; Commercial Banking; Correspondent Banking; Credit and Other Card Banking; Investment Banking; Retail Banking and

Wealth Management/Private Banking, Wolfsberg Group members are placed in many of the top places.⁴

It is estimated by the World Bank that 2.5 billion people do not have access to banking services. Of those that do, that is, approximately 5.5 billion, based on a global population of approximately 7 billion, it is estimated that the Wolfsberg Group members provide financial services to more than a billion of them.

The Wolfsberg Group members employ well over a million people, training all of their new and existing employees on the importance of money laundering prevention on a regular basis. Of these employees, thousands are solely dedicated to groups working directly on money laundering prevention issues, which together with investments in technology and run the bank costs supporting these tasks involves a direct financial cost to the Wolfsberg Group members of in excess of a billion dollars a year.

The work described below is not an exhaustive list of the Group's work, but are some of the more prominent papers and frequently asked questions (FAQs) issued by the Wolfsberg Group.⁵

The designations in the titles indicate how the Wolfsberg Group views the topic: 'Principles' are standards to be implemented by a financial institution throughout its operations, including branches and subsidiaries globally. 'Statements' on the other hand are position papers that delineate the role of financial institutions within a wider context. Guidelines and Papers are standards that are highly recommended but include optional approaches to the topic discussed. FAQs are chosen to explain a subject in more detail than would otherwise not be possible if another format was used.

The Anti-Money Laundering (AML) Principles 2000 / Global AML Guidelines for Private Banking 2002 (first revision)⁶

The first official and public piece of work by the Group focussed on money laundering in Private Banking. The work was completed following the exposure of numerous kleptocrats, most recently Sani Abacha of Nigeria and other so called "PEPs" including Raúl Salinas brother of Carlos Salinas, the ex-President of Mexico. This followed revelations against many former PEPs and would still be followed by those that would follow in their footsteps. The work started with a cooperation of internal standards and led to a compilation of best practices in Private Banking. The group would update their Standards later (see below). The AML principles, published in October 2000, were based on the more advanced AML laws and pre-empted those that would

soon afterwards be contained in the Basel Committee on Banking Supervision (BCBS) paper issued shortly afterwards. Principles included PEP and Beneficial Owner identification which was not the case in a number of countries at that time. The true novelty lay in the fact that the principles were to apply to all the banks' subsidiaries, including those in so called offshore centres and they contained the core elements of future work for the Group such as the Due Diligence Repository set out below, as well as detailed work on PEPs.

Statement Against Terrorist Financing 2002⁷

The terrorist attacks of September 11 2001 had a profound impact on the international financial sector and as such were of great concern to all the members of the Wolfsberg Group. The immediate reaction was the desire to play an active part in the fight against terrorism and at the same time to explain how financial institutions could help. The Group deliberated intensively over a short period of time and the Statement Against Terrorism Financing was issued in early 2002. The Statement demonstrated the Group's commitment in this area and identified areas of focus for both public and private sector to enhance success.

Correspondent Banking Principles 2002⁸

In fact, the second area of concern by the AML experts of the Wolfsberg Group was directed at Correspondent Banking, which, back in 2001, started to attract the attention of regulators and law enforcement. The Wolfsberg Group were the first to publish comprehensive recommendations on what, in their view, would be good practice in dealing with correspondents, and in particular when it comes to due diligence and monitoring.

Statement on Monitoring Screening and Searching 2003⁹

So far, the Group's work has stated the need for appropriate monitoring of transactions and customers to identify potentially unusual and suspicious activity and transactions, and for reporting such to competent authorities. However, it has not addressed issues related to the development of risk-based processes for monitoring, screening and searching of transactions and customers. The Group acknowledged that the risk profile may be different for a financial institution as a whole or for its individual units depending on the business conducted in a particular unit (for example, Retail, Private Banking, Correspondent Banking, and Broker Dealer). Any process is limited to detecting those clients and transactions that have identifiable characteristics that are distinguishable from apparently legitimate behaviours.

It becomes difficult, if not sometimes impossible, to make any distinctions between good and bad clients and acceptable and potentially illicit transactions because

money launderers and terrorists take all available actions to attempt to disguise their transactions and accounts by providing them with air of legitimacy. Three processes are defined: real-time screening, retroactive searching and transaction monitoring. The last process, monitoring, should not be limited to focusing of thresholds, but rather should be aimed at recognising unusual activity in comparison to known and expected activities.

Launch of the Bankers Almanac Due Diligence Registry 2004¹⁰

In the Wolfsberg Principles for Correspondent Banking issued in 2002, the Wolfsberg Group encouraged the development of an international registry for financial institutions which would enable them to obtain relevant information for due diligence on correspondent banks. The Wolfsberg Group started working on this topic with the Bankers' Almanac in 2003, and the latter then launched the "Due Diligence Repository" for the collection and storage of relevant due diligence information and documentation. The initiative aims to eliminate the need to reproduce, and repeatedly supply, due diligence information to counterparty banks. Instead, financial institutions can direct inquiries to the "Due Diligence Repository", where the most up to date due diligence information will always be stored. The Wolfsberg Group developed a list of required documents, reflecting recognised best practices with respect to necessary information to complete appropriate due diligence on which includes information on each financial institution's license (and the licenses of their subsidiaries), copies of corporate governance documents, biographies of board members and senior management, annual reports (including those of subsidiaries), and a completed, standard form Anti-Money Laundering Questionnaire.

During 2005 and early 2006, the Wolfsberg Group of banks actively worked on a number of separate papers, all of which aimed to provide guidance with regard to a number of areas of banking activity where standards had yet to be fully articulated by lawmakers or regulators. It was hoped that these papers would provide general assistance to industry participants and regulatory bodies when shaping their own policies and guidance, as well as making a valuable contribution to the fight against money laundering. These were:

Correspondent Banking FAQs 2006¹¹

The Correspondent Banking Principles were supplemented by FAQs published in 2006, which complemented the other sets of FAQs available on Beneficial Ownership, Politically Exposed Persons and Intermediaries.

Guidance for Mutual Funds and Other Pooled Investment Vehicles 2006¹²

The Group's work assists mutual funds and other pooled investment vehicles (e.g. unit investment trusts, hedge funds, private equity funds, and funds-of-funds) to manage their money laundering risk. Investors in many jurisdictions invest in these vehicles to seek professional management, diversification, and access to investment opportunities that might otherwise not be available. As a matter of general principle, there is no one approach to CDD that can be adopted by all pooled vehicles due to the variety of their characteristics and the different distribution channels. The appropriate level of CDD is determined on a combination of risks including investor, country, condition, and value. In a direct relationship, the vehicle should perform risk-based CDD on the investors. In an indirect relationship, the vehicle should consider the level of due diligence that should be performed in the intermediary taking into account the regulatory environment in the relevant jurisdiction, and the intermediary's responsibilities in respect of AML policies, procedures and controls. Depending on the outcome of the due diligence on the intermediary (and also on the requirement of applicable laws), the vehicle should determine the level of CDD on the investor.

Investment and Commercial Banking FAQs 2006¹³
Although much of the published guidance was also relevant to investment banking and commercial banking, certain aspects raising specific AML questions had not been addressed. They particularly related to questions on Financial Institution's clients in common scenarios, Customer Due Diligence (CDD) and its respective level in certain scenarios (when dealing with institutional intermediaries and their customers), or the Financial Institution's role in common and complex transactions. These FAQs also contain guidance that may be applied by Financial Institutions in the context of a reasonable risk-based approach to AML matters.

Guidance on a Risk Based Approach 2006¹⁴

At one of the first Wolfsberg meetings with regulators the idea of allocating resources in accordance with perceived risk was presented and discussed controversially among and within both the group of regulators and participating banks. After a few years the full merit of such a concept was acknowledged and accepted. In view of the wide practical implications of the introduction of such a concept, FATF invited Wolfsberg to nominate a representative to co-chair a joint working group to develop such a concept, which finally led to an FATF position paper and is now an integral part of the FATF 40 Recommendations. In parallel, Wolfsberg developed its own Statement, the Guidance on a Risk Based Approach for Managing Money Laundering Risks.

Statement against Corruption Guidance 2007¹⁵

The Statement against Corruption was issued in 2007. It focused primarily on corruption as a predicate offence to Money Laundering and was finalized in close association with Transparency International and the Basel Institute on Governance. It describes the role of the Wolfsberg Group and financial institutions more generally in support of international efforts to combat corruption. The Statement against Corruption identifies some of the measures financial institutions may consider in order to prevent corruption in their own operations and protect themselves against the misuse of their operations in relation to corruption.

Transparency of International Wire Transfers 2007¹⁶

Shortly thereafter, the Wolfsberg Group and The Clearing House Association LLC issued a statement endorsing measures to enhance the transparency of international wire transfers to promote the effectiveness of global anti-money laundering and anti-terrorist financing programmes. The four payment message standards that should be observed by all financial institutions are: (i) Financial institutions should not omit, delete, or alter information in payment messages or orders for the purpose of avoiding detection of that information by any other financial institution in the payment process; (ii) Financial institutions should not use any particular payment message for the purpose of avoiding detection of information by any other financial institution in the payment process; (iii) Subject to applicable laws, financial institutions should cooperate fully as practicable with other financial institutions in the payment process when requesting to provide information about the parties involved; (iv) Financial institutions should strongly encourage their correspondent banks to observe these principles.

FAQs on PEPs revised and reissued 2008¹⁷

(the original FAQs, were issued in 2003)

PEP identification and risk management continue to be major issues for Financial Institutions and this update reflects the concept of the Risk-Based Approach which emerged as a major regulatory theme. The Group's focus has gone beyond private banking / wealth management and has addressed other financial services segments. Therefore, the Group's statements and principles have been viewed in a much wider context. There is no single, universally agreed definition of a PEP. In formulating these FAQs, consideration was given to the standards issued by internationally-recognised bodies such as the FATF. Local regulations may differ in respect of particular elements of the PEP definition, and should be considered by a financial institution when determining PEP categorization standards and relationship management procedures.

Statement on Monitoring, Screening & Searching revised and reissued 2009¹⁸

Developments and operational experience, for example in the use and relative effectiveness of dedicated, automated transaction monitoring systems, together with the introduction of the Risk Based Approach made it appropriate to revise the 2003 statement. It supersedes the former paper providing more guidance on the design, implementation and on-going maintenance of transaction monitoring frameworks for real-time screening, transaction monitoring and retroactive searches. The Group has committed itself to the development of appropriate standards and benchmarking for effective risk-based screening, monitoring and searching models. The type of monitoring framework implemented will depend on a financial institution's risk assessment and so will vary between institutions and even between business units with a financial services group.

Guidance on Credit/Charge Card Issuing and Merchant Acquiring Activities 2009¹⁹

Threats to, and vulnerabilities of, credit/charge cards "Issuing" activities in relation to money laundering initiated the Group's work which provides guidance on managing these risks as part of a comprehensive approach to AML compliance management. The paper also addresses merchant acquiring ("Acquiring") including the underwriting, provision and maintenance of point of sales relationships. Acquiring activities, and their attendant AML controls, may be closely aligned to the risks and controls associated with cards, any many large financial institutions extend services to both card and merchant customers. Whilst this guidance does not specifically address terrorist financing, the undertaking of appropriate customer identification, acceptance, initial and ongoing due diligence may assist in preventing terrorist and terrorist organisations from accessing all financial services, including those associated with the provision of credit card/charge card issuing and merchant acquiring.

Wolfsberg Anti-Corruption Guidance 2011²⁰

This Guidance superseded the earlier Statement, broadening the approach giving tailored advice to international financial institutions in support of their efforts to develop appropriate Anti-Corruption programmes, to combat and mitigate bribery risks associated with clients or transactions and also to prevent internal bribery. The Guidance was timely as it took into account a number of recent developments, notably new laws for example, the entry into force of the UK Bribery Act and the related Guidance issued by the UK Ministry of Justice. Both TI and the Basel Institute on Governance were involved in the final reviews of the paper

Trade Finance Principles 2009 and 2011²¹

Trade Finance, due to the high degree of technicality has been out of scope for most regulators or even compliance departments. With increasing worries about the abuse of trade finance for the purposes of money laundering, but also the proliferation of forbidden goods (Weapons of Mass Destruction), the Wolfsberg Group decided to ask its specialists to look into the matter and advise on whether general recommendations would be possible and useful to the industry. At the same time, FATF was taking an increased interest into the matter, however had to realize that on many aspects they lacked the technical expertise to make recommendations. To overcome this issue, the Wolfsberg Group advised, together with the International Chamber of Commerce, FATF on the more technical aspects. In the end, whilst FATF focused on more general recommendations, the Wolfsberg Trade Finance Principles are more concerned about practical aspects for financial institutions, but with reference to the more general FATF recommendations. The development of these respective documents is a good example of an independent but productive public private partnership.

Guidance on Prepaid and Stored Value Cards 2011²²

As part of the continuing development and use of what the FATF referred to as New Payment Methods in its Reports dated October 2006 and October 2010, it is recognised that there is a growing demand in the marketplace and in financial institutions for migration to electronic payments from paper based processes. It is also recognised that New Payment Methods are powerful tools in support of financial inclusion, which will result in further and more dynamic expansion of the market for products of this nature. The Prepaid Card is currently the most widely used of the available New Payment Methods. The broadening of the payment methods has resulted in greater complexity for regulators and for banks, in relation to assessing the risks attached to them and the application of, and responsibility for, AML controls, particularly if the transactions flow through one or more jurisdictions. An important aspect when considering New Payment Methods is that these products/applications are distributed by a much wider range of service providers, including non-bank service providers, than the more traditional paper based payment methods and the more traditional credit/charge cards. The segmentation of services between numerous and varied parties involved in the New Payment Methods add additional complexity. This paper was written with the collaboration of American Express, The Electronic Money Association, PayLife and Standard Bank South Africa.

Private Banking Principles 2012; FAQs on Intermediaries 2012 and FAQs on Beneficial Ownership 2012²³

Most recently in May 2012, the Wolfsberg Group announced that it has revised its Anti-Money Laundering Principles for Private Banking, together with the related FAQs on beneficial ownership and FAQs on Intermediaries/Authorised Signers. The Private Banking Principles were the first standards issued by the Wolfsberg Group back in 2000. The Principles were revised in 2002.

While the general thrust of the Principles remains the same, they have been clarified and updated to outline practices that had not been referenced before. In addition, in the interest of clarity, some language was repositioned from the FAQs to the Principles. The concepts related to beneficial ownership were further delineated. A new appendix has been added to the Principles that sets forth items that should be required from a due diligence standpoint.

In addition to work on standards and guidance for financial institutions an annual Conference is held, known as the Wolfsberg Forum.

The Wolfsberg Forum

The Wolfsberg Forum celebrated its 10th Anniversary in late May 2013, first held in 2004 and from the outset was regarded as an opportunity to bring together regulators, law enforcement and financial institutions from all over the world. Through such meetings the Group sought to discuss relevant topical issues in plenary and breakout sessions, to broach the possibility of future work products for the Group and to test possible approaches to emerging AML challenges. At the same time the Group opened its work to non-members for selected issues and thus secured a greater range of input from non-member banks. Examples of papers being developed in this way include the various card papers. Financial institutions invited to the forum are generally large, international financial institutions operating in major financial centres. The meetings are held in English with no translation facilities, they follow Chatham House rules and the Wolfsberg chairman opens the conference with a review of the previous year's developments and current challenges for the industry in the broad sphere of AML compliance. The Forum is regarded by many participants as the opportunity par excellence to speak openly to regulators and law enforcement as well as to peers, and presents an unparalleled opportunity to thrash out the theory of new or proposed policies against the realities of implementation. Unlike many conferences there are frank and open discussions with a limited number of set pieces and more time allocated to discussion in the plenary or in smaller workshops. The discussions and opinions aired at the forum are further

considered by the Group and may be used to inform their future work.

The 10th and most recent forum focussed on discussing a number of issues that are of particular importance including the drive for increased transparency but set against increasing concerns over the lack of privacy and increased data protection; the desire for greater financial inclusion whilst also accepting at the same time increasing exclusion of increased risk activities and an examination of the role of risk based approach and calls for greater prescription. Whilst these trends were examined, so were ideas and concerns over "effectiveness", "culture of compliance", "risk assessments" the future of "correspondent banking" and much more.

On the subject of correspondent banking the Group shared the latest draft of an updated paper on correspondent banking due for release shortly together with updated FAQs and an updated Due Diligence Questionnaire.

The Wolfsberg AML Risk Radar

During the 10th forum the Wolfsberg Group asked participants to risk rate areas of AML risk, covering (i) Predicate Offences; (ii) Customer Risks; (iii) Products and Services Risks; and (iv) Programme Component Risk that were of particular concern at this time.

The results make interesting reading.

Under i) Predicate Offences participants ranked the following in order of increasing importance: Tax, Bribery, Fraud, Terror Finance, Organised Crime, WMDPF, Drug Trafficking, Market Manipulation, Insider Dealing and Environmental Crime. Under ii) Customer Risks participants considered PEPs as presenting most risks followed by: MSBs, Intermediaries, Precious Metals and Stones Dealers, Banks and other financial institutions, Casinos and Internet Gambling Firms, Charities, Gatekeepers, Arms Dealers and High Value Goods Dealers.

For iii) Products and Services Risks were headed not surprisingly by Correspondent Banking and Wealth Management/Private Banking, followed by Commercial Banking, Asset Management, Brokerage, Cards, Retail Banking, and lastly Investment Banking.

For iv) Programme Component Risks Customer Due Diligence topped the list followed by Transaction Monitoring, Risk Assessment, Controls and Testing, Sanctions Screening, SAR Filings, AML Training and Investigations.

Sanctions & Embargoes

Economic sanctions are imposed by the UN and countries to address threats posed by the activities of governments, individuals and organisations. They can involve business restrictions and the freezing of property, and they can affect business

activities of all kinds. Sanctions restrictions might not always be considered a formal predicate offense to money laundering, but there are connections between sanctions and money laundering that can be useful if recognised.¹ Once persons are sanctioned and blocked from access to financial systems, they are forced to seek ways to travel, conduct business, transport materials and raise money without detection. For example, with charitable donations drying up as a result of sanctions, extremist groups turn to crime to generate funds, the proceeds of which must be laundered.

Moreover, some of the activities that sanctions target – terrorism, corruption, and trafficking in drugs, humans and arms – require the means to operate undetected. These activities flourish together in environments with ineffective regulatory schemes and give rise to collaboration among criminals. Successful transport routes for drugs can be transport routes for weapons, and a common interest in using these routes creates connections among networks. Al-Qaeda is believed to be financing its operations by exacting tolls from drug smugglers and traffickers in arms, humans and illicit goods. A network moving drugs from South America to Europe via West Africa was, according to US investigators,² supporting both Al-Qaeda and the Revolutionary Armed Forces of Colombia (FARC).³ US authorities sanctioned Lebanese Canadian Bank SAL for facilitation of money laundering by an international drug-trafficking network and funding of terrorist organisation Hezbollah.⁴

Finally, sanctions are sometimes imposed to prevent money laundering. An overlapping network of multilateral sanctions against senior officials in Libya, Tunisia, Egypt and Syria took form in early 2011 in response to the violent crackdowns aimed at the civil protests in the Middle East. A goal of these sanctions was to prevent the misappropriation of public funds by fleeing regimes.

As sanctioned persons become more adept at evading sanctions, financial institutions will be under even more pressure to improve their ability to see possible connections between suspicious activity and terrorist financing – whether they are examining trade finance transactions, companies with opaque ownership structures attempting to open accounts, or unusual transfers involving politically exposed persons.

Terrorism

Terrorism is a topic of concern for many countries that predates September 11. The UN has been working to combat international terrorism since 1972. Thirteen counter-terrorism international conventions are in force.

It has been challenging to define it. The UN adopted numerous international documents to identify specific acts of terrorism, such as acts against means of transport, hostage taking, certain substances or devices for terrorist purposes; financing and bombings. However, questions persisted. Does terrorism include acts of armed forces? What is the difference between a terrorist and a rebel or freedom fighter? Are Palestinians, Chechens, Kurds and Tamil Tigers terrorists or simply struggling for self determination?⁵

Another complicating factor in defining terrorism has been that terrorists have been commonly viewed as products of specific regional conflicts. Iran was named a terror supporter by the US primarily for its support of Hezbollah, an Islamic movement founded after the Israeli military seizure of Lebanon in 1982. Cuba was designated in 1982 by the US as a terrorism supporter for supporting Central American leftist revolutionary movements. The US imposed sanctions to stop Palestinian terror groups from fundraising in the US and in 1995 sanctioned persons threatening to disrupt the Middle East Peace Process. The NATO bombings in response to Milosevich 1990's 'reign of terror' was focused on the Balkans.

Nevertheless, the idea of a global terrorist threat took form by 1998. On 23 February 1998, bin Laden and associates announced an offensive global jihad to expel so-called Western interference from the Islamic lands' affairs, and called on Muslims to kill Americans and their allies in any country possible. In August 1998, simultaneous truck bomb explosions in US Embassies in Tanzania and Kenya killed hundreds. The US expanded existing sanctions programmes to include Al-Qaeda in 1998.⁶

UN Security Council Resolution 1267, adopted unanimously on 15 October 1999, established a sanctions regime to cover individuals and entities

associated with Al-Qaeda, bin Laden and/or the Taliban wherever located. It calls on Member states to freeze assets, deny entry or transit, and prevent arms from reaching listed individuals. The resolution acknowledged that activities, including fundraising, was occurring on a global level.⁷

9/11 - Attacks on America

September 11 attacks raised awareness of a global terrorist threat for a significant part of the world. On September 11, 2001, citizens of some 90 nations were killed when Al-Qaeda attacked the World Trade Centre in New York, and elsewhere, the US Pentagon and downed a flight enroute the Washington DC, demonstrating the threat that any part of the population could be victimized anywhere by groups waging ideological warfare. Subsequent terror attacks in locations such as Riyadh, London, Abuja, Madrid, Mumbai, and Kampala reinforced this view.⁸

A couple of weeks later, the UN adopted Resolution 1373, making it binding on Member States via Chapter VII of the UN Charter. The resolution requires States to criminalise terrorism and its financing, deny terrorists safe heavens and secure international borders. The resolution created a Counter-Terrorism Committee, all 15 members of the Security Council, charged with assisting with states' compliance with UN terrorism-related protocols and conventions. States send reports to the committee identifying their counterterrorism efforts in seven areas: legislation, financial asset controls, customs, immigration, extradition, law enforcement and arms traffic. UNSCR 1373 is viewed as a groundbreaking in that it gave the international community a new counterterrorism framework. Many states have revised existing or adopted new counterterrorism laws as a result. While UNSCR 1373 calls for States to freeze assets of terrorists, it does not provide a centralized list of sanctioned persons and entities and leaves States to determine for themselves who such persons and entities are.⁹

The UNSCR 1267 consolidated list (now known as the Al-Qaeda sanctions list) remains the UN list for terrorism designations and has been focused on Al-Qaeda and the Taliban. In 2011, the UN Security Council decided to split the Al-Qaeda and Taliban sanctions programmes. The sanctions list maintained by the Security Council Committee established pursuant to resolution 1267 will now be known as the "Al-Qaeda Sanctions List" and include only names of those individuals, groups, undertakings and entities associated with Al-Qaeda.¹⁰

Reforms

There was no right of appeal against a UNSCR 1267 listing until December 2006. On 19 December 2006, the Security Council voted to establish a de-listing procedure whereby those who found themselves on the list could petition the committee for it to consider their case.¹¹

Some governments have been reluctant to enforce sanctions against persons on the 1267 list, citing insufficient due process safeguards. In 2008 the European Court of Justice ruled the process violated human rights standards in *Kadi & Al Barakaat v. Council of the European Union and EC Commission*. The UN implemented reforms in 2009 to address criticism about the fairness of the sanctions list process. The UN Security Council voted unanimously to create an ombudsman to consider the removal of terrorist suspects from the 1267 list. Work began in early 2009 to review all names on the 1267 consolidated list by June 2010 and an ongoing annual review thereafter to ensure each designation is reviewed every three years. The reviews have resulted in several delistings.¹²

US Anti-Terrorism Programme

Post 9/11, the US began to see many more terrorist groups, regardless of their location or motivation, as a global threat, particularly given the ability for groups to act and raise funds on a global level. US President Bush issued Executive Order 13224, declaring that the acts of grave terrorism and the threats of terrorism committed by foreign terrorists posed an unusual and extraordinary threat to the national security, foreign policy, and economy of the US. Executive Order 13224 gave the US President the means by which to disrupt terror financing networks of all kinds by authorizing the US government to designate and block the assets of not only foreign terrorists, but those that provide material support or assist them. Groups previously designated as "foreign terrorist organisations" under pre-September 11 authorities were quickly re-designated under the new Executive order. The "national emergency" authorities targeting the Taliban were terminated, and Taliban names were designated under E.O. 13224. Colombia's FARC, the Sabotage Battalion of Chechen Martyrs, Sri Lanka's Liberation Tigers of Tamil Eelam have all been listed as SDGTs on the OFAC sanctions list.¹³

Shortly after 9/11, the US PATRIOT Act gave the US President authority to combat terrorism by designating persons for sanctions "in aid of investigation," meaning that OFAC could block assets of suspect entities prior to a formal designation to prevent the flight of assets and/or damaging behavior. The power has sparked US court challenges and claims that a person's property

could remain blocked for months or years without the person being formally designated. The US may avoid sanctioning US citizens with this power in the wake of a US court ruling that OFAC blockings are "seizures" within the US Constitution's Fourth Amendment and therefore require due process protections.¹⁴

The differences between the US sanctions programmes and those of other authorities become more visible when institutions are attempting to comply with multilateral sanctions. An example is the fact that the US may block property not actually owned by a sanctioned party. The term "interest" is broadly defined in OFAC's sanctions regulations in Chapter V of Title 31 of the Code of Federal Regulations. An interest in property may be direct or indirect and includes property interests short of full ownership. In many instances, the interest may be partial or contingent. Therefore, innocent third party's funds could be stopped by a financial institution and frozen indefinitely because of a connection to a sanctioned party.¹⁵ The US annual Terrorist Asset Report published for the US Congress may list assets not actually belonging to terrorists. In its annual 2010 Terrorist Assets Report, the US Department of the Treasury explains:

Because the blocked assets discussed in this report include assets not actually owned by designated or blocked parties, they are described throughout as assets "relating to" a designated party. Many of the assets may be owned or subject to claims by third parties. This has created ownership disputes in US courts between holders of terrorism related judgments attempting to attach blocked assets and those persons whose property has been blocked by US financial institutions.¹⁶

In contrast, there is little formal guidance indicating that other nations enforce terrorism sanctions to this degree. UN resolutions call for Member States to freeze without delay the funds and other financial assets or economic resources "of" designated individuals and entities, implying a property interest.¹⁷

In August 2012, the US Government passed the Iran Threat Reduction and Syria Human Rights Act ("ITRA") which strengthened sanctions targeting Iran including those under the Comprehensive Iran Sanctions, Accountability, and Divestment Act of 2010 ("CISADA"). The act also targeted human rights abuses in both Iran and Syria. In sum, the ITRA substantially broadened the activities sanctionable particularly those relating to the providing services to Iranian government-linked entities, UN and US sanctioned persons, affiliates of Iran's Revolutionary Guard Corps, expanded

sanctions against Iran's energy sector, among other sanctions.¹⁸

Notably, ITRA also added a new section under the Securities Exchange Act of 1934 to require any US issuer to report in its annual public SEC filing whether the issuer or its affiliates (including non-US affiliates) had knowingly engaged in any Iran-related activities, or involved persons or entities designated as weapons of mass destruction proliferators or terrorists. The SEC is then required to report to the US President who is mandated to investigate and make sanctions determination.¹⁹

9/11 Litigation Cases

Thousands of civil suits have been filed by a variety of plaintiffs claiming negligence or other harm as the result of or following the attacks on 11 September 2001. For example, plaintiff's have claimed that airlines were negligent in permitting the 9-11 terrorists to board the aircrafts carrying items that could be used as weapons;²⁰ other suits have related to litigation filed by first responders (relating to, for example, inoperable radios on the day of the attacks), and sanitation workers (relating to health problems after being exposed to debris at "ground zero" or at the landfill on Staten Island where much of the debris, including human remains, were transferred from the Trade Centres).²¹ Countless businesses and insurance companies have battled over coverage for billions of dollars in property damage and lost property income.²² Suits filed by thousands of plaintiffs, including firms like Cantor Fitzgerald, a firm which lost 658 employees, and the 9/11 Families United To Bankrupt Terrorism, comprised of more than 6,600 family members of those killed in the attacks, have been based on claims that charities and countries like Saudi Arabia were complicit in financing the terrorists.²³ Still other suits have related to who gets the deposits of home buyers who withdrew from real estate deals following the tragedy. Litigation has even involved law suits filed before the 9-11 attacks due to lost documentation and evidence destroyed in the attacks.

Most of the victim's families have chosen to apply for payments under the Victims Compensation Fund which was established by the US Congress to assist those directly impacted by the attacks, rather than face the risks in filing a lawsuit.²⁴ However, other families angry at the failures in security have pursued litigation to seek answers rather than for financial recovery. Even more emotional have been the cases pitting family members against family members as to where to bury remains of victims. While many lawsuits have been settled by the parties or decided by judges, hundreds of other cases will likely continue for years to come.

Notably, a 2009 decision by the US Supreme Court will allow judges to dismiss a case if at the outset there are no concrete facts to state a plausible claim for relief. In the past, a plaintiff simply had to submit short bare-bones complaint to force a defendant to open their files and answers questions as part of the discovery process at great cost to the defendant. In *Ashcroft v. Iqbal*, the court ruled that a Muslim man could not sue two Bush administration officials for abuses he alleged he had suffered after being detained following the attacks.²⁵

Drug Trafficking

The US administers two list-based sanctions programmes aimed at narcotics trafficking.²⁶ The first is a programme that focuses on the Colombian cartels, and the second targets narcotics kingpins globally.²⁷ Both programmes were designed with the view that trafficking requires supporting networks, and each programme can sanction individuals and entities for assisting narcotics traffickers or for being owned or controlled by them.

Cali Executive Order 12978

In 1995, the US used the list-based approach of terrorism Executive Order 12947 as a model for a new programme to target Colombian drug cartels.²⁸ With Executive Order 12978, the President identified four Cali Cartel drug kingpins and expanded the order into a key tool in the fight against the Colombian Cartels. Entities and individuals associated with the Cali, North Valle, and North Coast Cartels and their business empires have been designated as Specially Designated Narcotics Traffickers ("SDNTs") under the order.²⁹

Building on the successes of the Colombian cartels programme, in 1999, the US Congress enacted the Foreign Narcotics Kingpin Designation Act ("Kingpin Act"). The Kingpin Act provides a statutory framework for sanctions against foreign drug kingpins and their organisations on a global scale. Like the terrorism programme under Executive Order 12947 and the SDNT programme under Executive Order 12978, the Kingpin Act is directed against the individual or entity and their support infrastructure, not against the countries in which they are located. Foreign persons designated under the Kingpin Act are referred to as "[SDNTK]s" on OFAC's listing of "Specially Designated Nationals and Blocked Persons" to differentiate them from the Specially Designated Narcotics Traffickers [SDNTs] named under Executive Order 12978. The Kingpin Act has its own set of civil and criminal penalties.³⁰ Over 1,000 individuals and entities have been designated for sanctions under the Act.

The targeting of individuals with asset freezes was seen by many as an effective alternative to the "War on Drugs" originally declared by US President Nixon in the 1970s, which was sometimes criticised as a cover for covert military operations to fight leftist insurgencies in Latin America. A 1986 US programme to deny aid to countries not "certified" as cooperating with the US War on Drugs was also largely viewed as counterproductive.³¹ The US has cited as one example of the list-based approach's success the guilty pleas of two Colombian kingpins in 2006 to make their families eligible to be removed from OFAC's designation list.³²

Over the past several years, the US has sanctioned nearly 3000 entities in Latin America involved in narcotics trafficking – almost 1800 entities have been designated under Executive Order 12978, and nearly 1,000 entities have been sanctioned pursuant to the Foreign Narcotics Kingpin Designation Act (the "Kingpin Act"),³³ (taken from June 24, 2011, OFAC Testimony Before the Oversight and Government Reform Subcommittee on National Security, Homeland Defence, and Foreign Operations, the Foreign Affairs Subcommittee on the Western Hemisphere, and the Foreign Affairs Subcommittee on the Middle East and South Asia). Though relatively few, the majority of delistings involve narcotics sanctions programmes designations. This makes sense, given that so many of the narcotics trafficking programme designations are based on commercial connections to networks attempting to launder drug money. Delistings can occur if (1) there is an insufficient basis for the designation (for example, error) or (2) the original reasons for the designation no longer exist (for example, resignation from a position with a sanctioned corporation or evidence of a corporate reorganisation that would eliminate control of an SDN).³⁴

Weapons of Mass Destruction

Weapons of Mass Destruction (WMD) are generally defined as weapons designed for mass, indiscriminate destruction, to kill large numbers of civilians and military personnel. The types of weapons considered to be in this class include: Nuclear weapons (including radiological weapons); Biological weapons; Chemical weapons; and Explosive material; as per UN Resolution 1540.³⁵

In 2004, the UN Security Council sought to limit the acquisition of WMDs by terrorists. Post 9/11, concerns centred on terrorist and black market networks obtaining WMD and related components, particularly from ex-soviet countries without effective export controls. The Council adopted Resolution 1540 establishing for the first time binding obligations on

all UN member states under Chapter VII of the UN Charter to take measures against the proliferation of WMD. The Resolution doesn't impose sanctions, but requires states to: (1) adopt and enforce laws prohibiting the proliferation of such items to non-state actors, and prohibiting assisting or financing such proliferation; and (2) take and enforce effective measures to control these items, in order to prevent their proliferation, as well as to control the provision of funds and services that contribute to proliferation.³⁶ The resolution followed public revelations about a North Korean nuclear weapons programme in October 2002 and revelations about Iran's nuclear programme in May 2003, two countries designated by the US as terrorism supporting states.³⁷

In addition to imposing WMD-related sanctions against countries like Iran and North Korea, the US imposes list-based sanctions against individuals and entities involved in WMD proliferation. OFAC implements three distinct sanctions programmes designed to combat the proliferation of WMD.

The first and earliest is an import ban. OFAC's Weapons of Mass Destruction Trade Control Regulations, 31 C.F.R. Part 539, implement a ban on imports into the US, pursuant to Executive Order 12938, of 14 November 1994. Under this programme, the Secretary of State may name, as subject to the ban, foreign persons determined to have engaged in proliferation related activities. 24 individuals and entities remain subject to these restrictions.³⁸

This programme was later enhanced with a blocking programme. Executive Order 13382 of 28 June 2005, requires US persons to block the property of individuals and entities engaged in proliferation activities and their support networks. It was created to take additional steps with respect to the Executive Order 12938. OFAC administers this blocking programme, which initially applied to eight organisations in North Korea, Iran, and Syria. To date, companies from over 25 different countries have been sanctioned under Executive Order. Most of the designations concern Iran, including Iran's biggest banks.³⁹

There is a third US programme regarding WMD that involves the US Government's use of sanctions to prevent judgment creditors from interfering with a uranium exchange between the US and Russia. A 1993 deal involved Russia's sale of highly enriched uranium extracted from dismantled Russian nuclear weapons to the US for conversion for use in commercial reactors. Uranium shipments were halted in 2000 because of US legal proceedings concerning a Swiss company's claim

against the Government of the Russian Federation that could have resulted in a judgment against payments owed by US to Russia or against processed uranium deliveries.⁴⁰ As a result of this delay, the President issued an Executive Order on 21 June 2000 that blocked the Russian Government's assets directly related to the implementation of the agreement from any judgment, thus allowing the shipments to resume.⁴¹

Country Sanction Programmes

The following are brief summaries of Sanctions issued by one or more important Bodies.

Belarus

In December 2010, tens of thousands of Belarusians arrived at a square in Minsk to protest President Alexander Lukashenko's re-election victory, reportedly with 80% of the vote. Lukashenko responded with a violent crackdown. Belarusian riot police beat and arrested over 600 protesters, including most of the opposition candidates and many journalists and human rights activists.¹ Following the demonstrations, the Government raided offices and pursued opposition party members and the press. Opposition leaders were sentenced to prison for organising the protests. The EU and US responded by expanding existing sanctions against the Lukashenko regime.²

Lukashenko, often referred to as "Europe's Last Dictator," has been in power since 1994 as a result of elections that international observers describe as rigged. He has repeatedly used brutal force against opposition demonstrators. After ten years in power, he changed the constitution, using a manipulated referendum, to allow himself to serve a limitless number of consecutive presidential terms. Reports from the UN, US and European organisations have cited Belarus' disregard for human rights, corruption and use of the judiciary for improper political ends.³

The EU has applied targeted sanctions for years against Belarusian government representatives including electoral commission heads, ministers, security service officers, prosecutors and judges. In 2004, the EU issued travel bans against four individuals believed responsible for the disappearance of opposition members.⁴ The EU expanded this travel ban in 2006 to an additional 36 persons responsible for committing election fraud, and introduced an asset freeze. In the autumn of 2008, it suspended the travel ban against 36 people, in response to Lukashenko's release of opposition representatives from prison.⁵ Following the December 2010 election crackdowns, the EU restrictions reinstated the travel ban against Lukashenko and associates, and introduced additional asset freezes and an embargo on arms and

equipment that might be used for internal repression.

The US, acting with the EU, imposed in 2006 travel restrictions and targeted financial sanctions against Belarusian officials implicated in the human rights abuses and election fraud.⁶ In 2007, the US extended travel restrictions to directors and deputy directors of state enterprises and froze the US assets of Belarus' oil and chemical conglomerate, Belneftekhim.⁷ After the Belarusian authorities released the last of its political prisoners in 2008, the US suspended sanctions for 6 months on two Belneftekhim subsidiaries, Lakokraska and Polotsk Steklovolokno. In 2011, however, the US reinstated these sanctions and blocked four more Belneftekhim subsidiaries. Beginning in 2006, Switzerland also joined the EU in targeting Belarusian officials for sanctions.⁸

Media sources report that Belarus is beginning to act as middleman for Iran's access to Russian technology. Its role is reported as key to Iran's development of surface-to-surface missile and nuclear capabilities, particularly given the drastic reduction in Iran's ability to procure products from countries such as China, Russia and Dubai. In 2009, Belarus was reported to be selling Russian-made Iskander-M tactical missile systems⁹ to Iran, which the Belarus government has denied. In March of 2011, the US imposed sanctions on, Belarusneft, a state-owned energy company in Belarus for its involvement in the Iranian petroleum sector.¹⁰

Democratic Republic of the Congo

A multilateral arms embargo is in place, and an asset freeze targets political and military leaders responsible for armed conflict and human rights violations in the Democratic Republic of the Congo.¹¹ However, no broad-based sanctions restrictions are in effect against the people or the country of the DRC.

The Democratic Republic of the Congo is a large country that shares borders with nine other countries, and has been devastated by political violence. The government does not have control over the large parts of its territory, particularly in the east where armed groups continue to fight and where the prevalence of rape and other sexual violence is the worst in the world. President Joseph Kabila does not maintain central control over the country's military. The provinces where metal mining takes place are overrun with militias and rogue army units that finance themselves with the region's metal mining. These conditions are remnants of two wars on DRC soil involving several African countries.¹²

The First Congo War (1996). In the wake of the 1994 Rwandan genocide, in which 800,000 Tutsis

and moderate Hutus were killed, millions of Rwandan refugees flooded into the eastern DRC. Although UN sources estimated that only a fraction of these refugees acted in the genocide, Rwanda and Uganda invaded eastern DRC in 1996 to root out genocide perpetrators, teaming with Congolese opposition leader Laurent Desiré Kabila. This force defeated DRC dictator Mobutu Sese Seko and the Congolese army, and Laurent Desiré Kabila became President.

The Second Congo War (1998) involved seven foreign armies and killed over 5.4 million people. It began when President Laurent Kabila ordered Rwandan and Ugandan forces to leave the eastern DRC, fearing they would try to annex the mineral-rich territory. Rwanda had ties to the Tutsi community in eastern DRC and feared for its safety. Angola, Zimbabwe, Chad, Libya and Sudan supported Kabila in this conflict against Uganda and Rwanda. Despite a 1999 ceasefire and peace agreements signed in 2002 and 2008, multiple armed groups continue to destabilize the region and terrorize civilians. Tutsi forces have pursued the Democratic Forces for the Liberation of Rwanda (FDLR), which is led by persons held responsible for the Rwanda genocide.¹³

On 28 July 2003 the UN Security Council (UNSC) adopted resolution 1493 (2003) imposing sanctions in relation to the DRC in response to acts of violence systematically perpetrated against civilians, including massacres, other atrocities and violations of international humanitarian law and human rights.¹⁴ The sanctions regime was modified and strengthened with the adoption of resolutions 1533¹⁵ (2004), 1596 (2005), 1649 (2005), 1698 (2006), 1768 (2007), 1771 (2007), 1799 (2008) and 1807 (2008).¹⁶

All States remain under an advance notification obligation regarding any shipment of arms and related materiel for the DRC. The UNSC further extended the arms embargo and targeted travel and financial sanctions in resolution 1952 (2010) against FDLR leaders and a former Congrès National pour la Défense du Peuple commander integrated in the Congolese Armed Forces.¹⁷ Authorities including EU, Australia, Switzerland, Canada, US, Singapore and Hong Kong have implemented restrictions based, in whole or in part, on UN resolutions.¹⁸ Additionally, US requires companies to disclose the exact source of metals procured from the Congo.

President Laurent Kabila was assassinated in 2001 and his son Joseph Kabila was appointed and in 2006 won the presidency in the DRC's first democratic elections in 40 years.¹⁹

Cuba

The US economic embargo against Cuba remains comprehensive, targeting both the Cuban Government and Cuban nationals. It prohibits trade, payments and financial services with limited exceptions, and it requires the freezing or blocking of property in which Cuba or Cuban nationals have an interest. This is the oldest US trade embargo, but the US regularly conducts cash trade with Cuba via licenses for the sale of food and medical supplies.

The Cuba embargo has existed since the 1960s, when it was created from broad presidential powers to address war time threats. A trade embargo was imposed in 1960 after Cuba nationalized property of US citizens and companies. In 1963, the US froze Cuban assets in the US and imposed a complete embargo against Cuba and its citizens in response to the Cuban Missile Crisis, during which Cubans hosted Soviet nuclear weapons approximately 90 miles from the US mainland.²⁰

The embargo was tightened in 1996 by the Cuban Liberty and Democracy Solidarity Act (known as the Helms-Burton Act) after Cuban fighter jets shot down two planes piloted by a Cuban exile group off the Cuban coast. The law permits lawsuits in American courts against non-US companies who invest in businesses once owned by Americans or by Cubans now living in the US. In response to the Helms Burton Act, Canada, Mexico, the EU and the UK created measures to counteract the extraterritorial effect of the Helms Burton Act.²¹

The US continues to view Cuba as a State Sponsor of Terrorism, particularly for its provision of physical safe haven and ideological support to members of - the FARC, ELN, and ETA providing them with living, logistical, and medical support. The US has designated the three organisations as Foreign Terrorist Organisations.²²

Nevertheless, the US loosened restrictions in 2011 with licenses for transactions with Cuban nationals residing outside of Cuba, travel for educational and religious activities, family remittances and payments to support of religious activities.²³

Palestinian Territories

Currently, the Palestinian Authority is sanctioned by the US only in so far as its activities involve an interest of Hamas. However, several banks processing transfers involving the Palestinian territories have found themselves the targets of civil litigation.²⁴

The 2006 parliamentary elections in the West Bank

and Gaza resulted in members of the terrorist group Hamas forming the majority party within the Palestinian Legislative Council and holding positions of authority within the government. In response, the US government determined that Hamas had a property interest in the transactions of the Palestinian Authority. This determination meant that US persons could not engage in transactions with the Palestinian Authority unless authorized by the US. However, dealings with private companies and individuals in the Palestinian Territory were permitted, as were dealings with local government not part of the Palestinian Authority.²⁵

In 2007, Salam Fayyad became the new Prime Minister of the Palestinian Authority and appointed as ministers other individuals not affiliated with Hamas. OFAC issued a license that essentially lifted the sanctions against the Palestinian Authority created by OFAC's earlier guidance. OFAC defined the Palestinian Authority as the government of Prime Minister Salam Fayyad and President Mahmoud Abbas, including all branches, ministries, offices, and agencies.²⁶

Despite the license, it has not always been easy to distinguish between transactions destined for the West Bank and Gaza that ultimately benefit Hamas and those that do not. The Palestinian Authority has not been able to combat terrorism in the West Bank because of limited mandates and because of Hamas' continued control. The US government reports that in 2010 an organised Hamas force of 15,000 continued to consolidate control over Gaza by marginalizing rivals. Gaza-based Palestinian terror groups staged rocket and mortar attacks into Israeli territory and over 100 terrorist incidents were reported as taking place in 2010 near Gaza's security perimeter. Groups involved included Hamas, the Palestinian Islamic Jihad and the Popular Resistance Committee. Rockets with larger warheads and longer ranges are being built within Gaza. Iran is providing medium range rockets. Israel enforces strong measures to restrict economic activity with Hamas controlled Gaza Strip.²⁷

Several banks face multimillion dollar civil law suits brought in the US by terror victims alleging that the banks processed transactions involving Hamas. Below are some brief examples:

Linde v. Arab Bank

In 2004 three groups of Israeli based plaintiffs alleged they or their family members were harmed by acts of terrorism that occurred in Israel or the West Bank/Gaza from 1995 to 2005. They allege that the bank held accounts for individuals and organisations that, in turn, supported terrorist activities. Plaintiffs specifically argue

that the bank is liable for processing payments sent by the “Saudi Committee in Support of the Intifada Al Quds” to Palestinians from 2000 through 2004. These payments, according to the plaintiffs, were intended to encourage acts of terrorism.

The bank maintains that it provided routine financial services in compliance with governing laws and regulations. It denies ever knowingly supporting terrorism in any way. According to the bank, the Committee was not an account-holder, it believed that the Committee was a legitimate humanitarian organisation, and its role in handling the Committee payments was limited to processing transfer instructions sent from a correspondent bank in Saudi Arabia.

To date the Committee has not been designated as a financier of terrorism by the US.

In 2007, the bank filed third-party complaints against Bank Hapoalim, B.M., Israel Discount Bank Ltd. and Mercantile Discount Bank Ltd., alleging that each of these banks initiated or processed funds transfers for some of the same organisations that plaintiffs allege served as well known “fronts” for terrorist organisations. The bank argued that to the extent that it might be found liable to plaintiffs for providing financial services to these same organisations, Bank Hapoalim, B.M., Israel Discount Bank Ltd. and Mercantile Discount Bank Ltd. should contribute to any damages.²⁸

On 3 April 2009, the District Court dismissed the claims against Bank Hapoalim, B.M., Israel Discount Bank Ltd. and Mercantile Discount Bank Ltd. after finding that neither the Anti-Terrorism Act nor the Alien Tort Statute provided the bank with a right to seek contribution from parties that were not named in plaintiffs’ complaints. The bank previously sought discovery from Bank Hapoalim, B.M. and Israel Discount Bank Ltd. arguing that those Israeli banks initiated or participated in financial transfers for some of the same parties that plaintiffs allege were well-known “fronts” for terrorist organisations that directed their violent activities against the State of Israel. The bank argued that these records, if produced, would offer “circumstantial evidence of [its] lack of knowledge” that the charities at issue were allegedly well-known “fronts” for terrorist organisations opposed by Israel. However, the Bank’s discovery requests as to Israeli bank records were denied after the Court, via Judge Gerhson, found that those records were protected from disclosure by foreign financial privacy laws.²⁹

In November 2010, Arab Bank filed for a Writ of Mandamus against Judge Gerhson, alleging that she had abused

her discretion by overriding the recommendations of her magistrate and by imposing such severe sanctions without further hearings. In addition Arab Bank’s lawyers asserted that Gerhson failed to duly respect the secrecy laws regulating the bank in Jordan, Lebanon and the Palestinian territories. Significantly, the Jordanian government submitted an amicus curiae in support of Arab Bank, also asserting that any damage to the bank had the potential to undermine global anti-terrorism prospects by forcing customers into underground financial systems that would be much harder to monitor. Further support was lent by amicus curiae briefs submitted by the Union of Arab Banks and the Institute of International Bankers. The petition for a Writ of Mandamus was heard on 6 March 2012 by three judges of the Second Circuit.

On 18 January 2013 the Second Circuit dismissed Arab Bank’s appeal and denied its petition for a writ of mandamus, on procedural grounds, stating that it didn’t have jurisdiction to hear the appeal pre-trial. In its decision, the court said, “the sanctions order is not a reviewable collateral order, and we therefore dismiss the bank’s appeal for want of jurisdiction.” On 14 February 2013, the bank filed a letter with the Second Circuit submitting as supplemental authority the Second Circuit’s decision to uphold a lower court’s dismissal of Rothstein v UBS.

Rothstein v. UBS

In Rothstein, a case which was brought against UBS by 45 victims of terrorist bombings and rocket attacks in Israel by Hamas and Hezbollah between 1997 and 2006, the Plaintiffs claimed that while UBS did not have direct dealing with the terror groups, cash exchanges made by the bank pursuant to an Extended Custodial Inventory Agreement with the Federal Reserve subjected it to OFAC regulations. The plaintiffs argued that the bank’s actions had aided and abetted international terrorism in violations of those sanctions and therefore, under the Anti-Terrorism Act of 1990 (ATA), was subject to civil liability to victims of these terror attacks. The court held that the plaintiffs had failed to establish UBS’ actions were a “proximate cause” of the terrorist acts committed by Hezbollah and Hamas and funded by Iran and therefore, under ATA, Plaintiffs were not entitled to recovery.

Weiss v. National Westminster Bank

Terrorism victims and their families have sued National Westminster Bank, or NatWest, which is part of the Royal Bank of Scotland Group, for maintaining accounts of the Palestinian Relief and Development Fund, a British charity known as Interpal. The Israeli Government designated Interpal as a terrorist organisation in 1998, and the US designated Interpal as a Hamas fund-raiser in 2003. Plaintiffs in the case

include relatives of victims of a Hamas suicide bomber on a bus in Jerusalem on 19 August 2003. NatWest responded in legal papers that UK charity regulators had twice cleared Interpal of terrorist links. The court initially refused to grant the bank’s motion to dismiss.³⁰ On 28 March 2013 the Court granted summary judgment to NatWest finding that the plaintiffs had failed to establish sufficient evidence to prove that NatWest either “had actual knowledge” that Interpal was funding Hamas or had acted with “exhibited deliberate indifference”. In assessing the banks state of mind, the Judge noted the banks compliance with foreign banking laws. This decision has been appealed.

Strauss v. Crédit Lyonnais

Crédit Lyonnais is a defendant in a civil suit alleging that the institution held accounts for French charity CBS. The suit is brought by family members of victims of terrorist attacks occurring between March 28, 2001 to August 19, 2003. The US designated CBS in 2003 for fundraising for Hamas in collaboration with humanitarian organisations in the West Bank, Gaza, Jordan and Lebanon. The State of Israel outlawed CBS in 1997, and designated it a terrorist organisation in 1998. Crédit Lyonnais maintained accounts for CBS and transferred funds at CBS’s request to Hamas-controlled organisations in the West Bank and Gaza Strip. The plaintiffs allege that beginning in 2000, Crédit Lyonnais knew that its customer, CBS, was transferring money to Hamas-controlled entities. The case continues.³¹

Keren Elmaliach v. Bank of China Ltd

84 victims of Hamas rocket attacks have sued the Bank of China in the US Court for processing payments benefitting Hamas. The plaintiffs, who include family members of victims of terrorist bombings and rocket attacks carried out by Palestinian Islamic Jihad and Hamas in 2006 and 2007, are claiming that the Bank of China aided and abetted the attacks by providing wire transfer services to both terror groups. They allege that a Hamas operative received money into his account from Hamas’ headquarters in Syria and then transferred it to Gaza. The plaintiffs argue that the bank should have seen the cash transfers as a red flag and ignored a warning from the Israeli Government that the funds were being used to finance terror attacks. In 2011, Bank of China lost the argument that the US was not the best forum for the complaint. The Case continues.³²

Gill v. Arab Bank

In a civil litigation action filed in, 2011, a resident of Israel, Mati Gill, sued Arab Bank for damages under the Anti-Terrorism Act for injuries he sustained in an alleged terrorist attack that occurred in Israel in

2008. Gill alleged he sustained wounds as a result of gunfire shot from Gaza into Israel that he attributed to Hamas. In his complaint, Gill asserts the bank acted recklessly, knowingly or intentionally in processing financial transactions that benefited individuals and organisations that were allegedly affiliated with Hamas, and that this contributed to Hamas ability to conduct terrorist attacks.³³ On 12 September 2012, Senior Judge Jack B. Weinstein found the plaintiff failed to show the bank directly caused the attack, dismissing his claim that the bank aided and abetted Hamas. And then Judge Weinstein dismissed the Plaintiff’s claims in their entirety on 6 November 2012 after concluding that “the evidence does not prove that the bank acted with an improper state of mind or proximately caused plaintiff’s injury”.³⁴

Iran

Iran is the subject of multilateral sanctions, including four UN Security Council Resolutions imposing arms embargoes and asset freezes targeting persons involved in Iran’s nuclear development and terrorism support. Member states’ sanctions against Iran have in many instances exceeded the UN measures. The EU restricts payments to and from Iran and prohibits a list of commercial activities and supporting Iran’s petroleum industry and nuclear development. The US enforces a long-standing, comprehensive embargo against Iran, prohibiting US persons from providing services of any kind to Iran or its nationals and freezing assets of key Iran Government banks and parastatals.³⁵ Most recently US sanctions have imposed liability on US parent companies whose foreign subsidiaries or affiliates engage in prohibited transactions involving Iran unless the US parent and requires that the US parent divests itself from the foreign subsidiary or affiliate unless it can demonstrate that such activity was licensed.³⁵ Iran has been on the US Department of State’s State Sponsors of Terrorism List since 1984 and is the world’s most active sponsor of state terrorism, according to the US Government.³⁶ US authorities maintain that Iran is allowing Al-Qaeda to use Iran as a transit point for money, arms and fighters based in Pakistan and Afghanistan.³⁷ The Quds Force, the external operations branch of the Islamic Revolutionary Guard Corps, has provided weapons, training, and funding to Hamas, Palestine Islamic Jihad, the Taliban in Afghanistan, and Iraqi Shia militant groups that targeted US and Iraqi forces.³⁸ Following Israel’s invasion of Beirut in 1982, Iran supported the creation of Hezbollah with the arrival in Lebanon of 1,500 Islamic revolutionary guards from Iran, and remains a close ally and financial supporter. Senior IRGC, IRGC Quds Force, and Iranian Government officials were indicted by the Government of Argentina for their alleged roles in the

1994 terrorist bombing of the Argentine-Jewish Mutual Association.³⁹

US Sanctions

Relations between the US and Iran turned hostile following the 1979 revolution in which Iran's Shah was deposed and replaced by an Islamic republic. A group of Islamist militants took over the American Embassy and held 52 Americans for over a year. In response, the US restricted transactions between US persons and Iran, and blocked Iranian property. In 1981, the US and Iran reached an agreement, known as the Algiers Accords, which led to the release of the hostages and the unfreezing of most Iranian assets. Some property of the Government of Iran remains frozen.⁴¹

In the 1980s the US-Iran relations deteriorated as a result of Iran's support of terrorist groups and the US involvement in Middle East affairs including the Iran/Iraq war and Lebanon. The US imposed import/export restrictions involving Iran in 1987, following attacks on American forces and Kuwaiti vessels flying the American flag in the Persian Gulf. Additional grounds for the sanctions were Iran's continued support of Hezbollah, which abducted over 90 hostages from 21 nations in the 1980s to force an end to US involvement in Middle East conflicts. Hezbollah was responsible for suicide bombings against American targets in 1983 and 1984 on two US Embassies in Beirut and the US Marine peacekeepers barracks.

In the 1990s US attempted an aggressive expansion of its sanctions against Iran amidst fears of Iran's continued terrorism support and development of weapons of mass destruction. In 1995, US President Clinton imposed a full embargo against Iran as part of a "Dual Containment" policy aimed at both Iran and Iraq. One catalyst was intelligence reports that Iran was acquiring components for nuclear weapons. These sanctions followed EU countries' criticism of the US for continuing to import Iranian oil while they had been pressured to cooperate with the US containment policy.⁴² In 1996, the US Congress passed the Iran and Libya Sanctions Act (ILSA) to reduce Iran's ability to export oil and gas and thus deny funds for the development of WMD and support of international terrorism. ILSA required the President to impose at least two out of a menu of six sanctions on foreign companies (entities, persons) that make an investment of more than \$20 million in one year in Iran's energy sector. The law gave the President the ability to assert a waiver of sanctions to serve US national security interests.⁴³ The EU reaction to ILSA was decidedly negative, and in 1996 it adopted "blocking legislation" to prevent EU companies and their subsidiaries from

complying with ILSA.⁴⁴ In addition to encouraging member states to impose their own sanctions on companies complying with ILSA, the EU decided to lodge a complaint against the US with WTO.⁴⁵ This 1996 US statute was not enforced as the US Congress expected. French company Total signed contracts with Iran for the development of oil fields prior to the passage of ILSA in 1995 and after ILSA was in effect in 1997, the latter being for the development of part of the South Pars field with partners Gazprom and Petronas. The US Congress pressured the US President to enforce ILSA. However, the US State Department announced an ILSA waiver for Total, noting France's cooperation to combat terrorism and WMD developments in Iran, and indicated that the waiver would be used in similar situations. Another of the administration's concerns was the potential for other countries to impose reciprocal sanctions against US corporations.⁴⁶ In 1997, the US and the EU formally agreed to try to avoid a trade confrontation over ILSA.⁴⁷

Nuclear Threat and Multilateral Sanctions

The concern for Iran's support of terrorist groups grew with concerns about Iran's nuclear ambitions. Iran's secret underground uranium-enrichment facility in Natanz was discovered in 2002 via satellite. The International Atomic Energy Agency (IAEA), the UN's nuclear watchdog, began an inspection in 2003, and the existence of weapons grade plutonium was discovered. There was fear that Iran was enriching plutonium for nuclear weapons. Its raw fuel needs for energy were supposedly already met by an arrangement with Russia as part of the Bushehr reactor project begun in the 1970s under the Shah. Iran agreed with the EU to temporarily suspend uranium enrichment.⁴⁸ However, Iran's then President Mahmud Ahmadinejad announced in 2005 Iran's plan to resume enrichment. Thereafter, Iran refused to cooperate with UN nuclear facility inspectors, and it refused to comply with the UN Security Council's demand that Iran suspend nuclear enrichment and reprocessing.⁴⁹

In response, the UN imposed four sets of sanctions, in Security Council resolutions 1737 (2006), 1747 (2007), 1803 (2008) and 1929 (2010). These resolutions collectively call for cargo inspections and bans on the sale of materiel and technology related to nuclear enrichment and ballistic missile development, as well as asset freezes on individuals, banks and organisations supporting Iran's military and nuclear programmes. The asset freezes targeted those persons and agencies instrumental for Iran's nuclear development and terrorist group support.⁵⁰ Those designated included the Atomic Energy Organisation of Iran, key persons and entities of the Islamic Revolutionary Guard Corps

(IRGC) and other entities supporting Iran's nuclear development.⁵¹ Additionally, the US and EU designated some of Iran's largest banks, Bank Melli, Bank Mellat, and Bank Saderat, for having facilitated Iran's proliferation activities or its support for terrorism. The US placed sanctions on Iran's Quds Force as a terrorism supporter.⁵²

In 2008, the US blacklisted the state controlled Islamic Republic of Iran Shipping Lines (IRISL) and all of its ships in 2008. Vessels boarding by US and Israeli authorities revealed a large arms cache, including thousands of rockets, grenades and mortar shells, destined for Hezbollah. IRISL took steps to hide its connections to vessels identified on the US sanctions list. The IRISL ships' Iranian flags were changed, and vessels' names were changed.⁵³ Three new Iranian front companies took over the operation of the majority of the blacklisted ships: Hafiz Darya Shipping Lines, Sapid Shipping and Soroush Sarzamin Asatir.⁵⁴ US authorities brought criminal charges against these companies for deceiving at least nine banks into processing over US\$60mio in transactions benefitting Iran.⁵⁵ In 2009, another secret enrichment plant being built by Iran underground was exposed. This plant was being built with capacity for 3000 advanced centrifuges for enrichment near Qom - not enough for commercial use but enough for the processing of weapons grade uranium. The heavily disguised facility was in breach of a 2003 agreement with the IAEA to provide early design information for any nuclear facility construction.⁵⁶

The UN Security Council's fourth set of sanctions measures against Iran in 2010 were the strongest measures to date. In addition to weapons embargo provisions, UNSCR 1929 called on Member States to prohibit financial services (including banking and insurance) if there are reasonable grounds to believe that such services could contribute to Iran's nuclear or missile programmes. However, the resolution does not have the scope of the broad US sanctions restrictions, nor does it ban trade in oil and gas, Iran's principal source of revenue. Countries imposing sanctions against Iran following UNSCR 1929 include Canada, Australia, South Korea, Japan, India and Israel.⁵⁷

The EU's measures went further than UNSCR 1929. A goal of EU Council Regulation (EU) No 961/2010, published on 27 October 2010 was to prevent financing, services and key equipment and technology from benefitting Iran's oil and gas industry, which was recognised as integral to Iran's funding of its weapons development. In addition to an arms ban and asset freeze of identified persons, the regulation restricts trade with Iran in relation to investment; the oil and

gas industry; uranium mining; the insurance and bonds sector; the financial services industry; and transport. The most controversial part of the regulation was the restriction on transfers of funds to and from Iranian individuals and entities.⁵⁸

In 2011, Switzerland imposed sanctions against Iran similar to the EU restrictions.⁵⁹ Its military goods ban was extended to dual use goods, and certain restrictions were imposed on financing and exports supporting Iran's oil and gas industry.⁶⁰

Between 2010 and 2012, in an effort to further increase pressure on Iran to return to constructive dialogue in the wake of international concerns about the connection between its energy sectors and its nuclear programme highlighted by UN Security Council Resolution 1929, the US tightened existing sanctions against Iran and issued broader sanctions targeting the country's energy sector designed to further isolate Iran from the international financial community. First, in 2010, President Barack Obama signed into Law the Comprehensive Iran Sanctions Accountability and Divestment Act (CISADA), which amended the Iran Sanctions Act of 1996, significantly expanded the energy-related activities that are subject to sanctions unless a waiver has been received, imposed new sanctions with respect to foreign financial institutions that knowingly facilitate Iranian WMD transaction or activities and transactions with designated Iranian-linked banks and other blocked persons.⁶¹

In 2012, in what has been considered even more sweeping legislation, President Obama signed the Iran Threat Reduction and Syria Human Rights Act (ITRSRA) which expanded the types of Iran-related activities subject to sanctions. At the outset the ITRSHRA expanded the extraterritorial reach of US sanctions laws by requiring foreign subsidiaries and affiliates that are majority owned or controlled by a US person to abide by US sanctions against Iran, and holding the US parent liable for any violations committed by the foreign sub or affiliate. Previously, foreign entities were not directly bound by sanctions against Iran unless US persons were involved.⁶² Additionally, ITRSHRA requires US foreign private issuers who have engaged in activity prohibited to publicly self-disclose such activity. Any such disclosures will require the US President to initiate an investigation into whether sanctions should be imposed on the party making the disclosure.⁶³ In sum, the ITRSHRA substantially broadened the scope of activities that are subject to sanctions, targeting particularly those related to providing financial services to entities linked to the government of Iran and also broadened sanctions

against Iran's energy sector.

See also Breaking News below at the end of this Book.

Myanmar

The EU, US, Canada and Australia have imposed sanctions against the Myanmar government in reaction to the Myanmar regime's repression of its people. Since 1996, the EU has held a common position⁶⁴ imposing sanctions on Sanctions restrictions include a travel ban on top political officials, an arms embargo, a freezing of the assets of Burmese officials and their business partners, a ban on financial services and investment and restrictions on exports and imports, and cessation of trade preferences, and suspension of all aid with the exception of humanitarian aid.

The US first imposed sanctions against Myanmar⁶⁵ in 1997, when the US banned new US investment in economic development of resources in Burma because of Burma's military regime's continuing repression of the democratic opposition. The US President noted that the regime had arrested and detained large numbers of students and opposition supporters, sentenced dozens to long-term imprisonment, and prevented the expression of political views by the democratic opposition.⁶⁶ Additionally, the US President noted Myanmar's role in the drug trade as the world's leading producer of opium and heroin.

In 2003, the US⁶⁶ strengthened sanctions against the Burmese regime because of its continued human rights abuses, the detention of pro-democracy leader Aung San Suu Kyi, and its refusal to honor the election results of the 1990 People's Assembly election. On 28 July 2003, the US President signed into law the Burmese Freedom and Democracy Act of 2003 and an implementing Executive Order to prohibit the importation into the US of Burmese-origin goods, the provision of US financial services to Burma and the processing of payments involving Burma. These measures, as well as subsequent Executive Orders, froze assets of persons identified as supporting the Burmese regime.

These sanctions did not deter the regime's⁶⁷ pattern of repression. In late 2007, the Government raided Buddhist monasteries and arrested monks, the country's highest moral authority, to quell peaceful civil protests led by monks following a Government decision that caused a huge rise in the price of fuel. The EU, US, Canada and Australia each issued sanctions⁶⁸ against the regime. One of the goals of the EU and US sanctions was to take aim at the regime's dependence on, and strict control of, the sale of precious stones and other items. The EU imposed trade restrictions on items such

as timber, metals, and semi-precious stones. In 2008,⁶⁹ the US augmented its 2003 sanctions with restrictions on imports of jadeite and rubies mined from Burma (and jewellery containing these stones). Canada's sanctions were considered some of the broadest,⁷⁰ including a full export/import ban, a ban on new investment and a restriction on financial services. In 2010, the EU added more stringent⁷¹ bans on business activity and investments and freezing the assets of a broader list of individuals and entities.

Certain changes are occurring in Myanmar. In 2010, Aung San Suu Kyi was released from prison. The first legislature in 22 years was formed in 2011. However, it is believed that the sanctioned military regime will continue to control the country with an iron fist.⁷²

Burma is reported as the world's second largest producer of opium, located at the corner of the Golden Triangle. In 1996 the US Embassy in Rangoon released a "Country Commercial Guide", which states "Exports of opiates alone appear to be worth about as much as all legal exports." A four-year investigation concluded that Burma's national company Myanmar Oil and Gas Enterprise (MOGE) was "the main channel for laundering the revenues of heroin produced and exported under the control of the Burmese army."⁷³

Myanmar has become one of the main gas exporters in Asia and that Burma's oil and gas sectors are the major sources of foreign currency for the regime. Corporations operating the Yadana natural gas pipeline in southern Myanmar are making annual payments to the junta.⁷⁴ The Shwe gas project is estimated to generate royalties for the Burmese regime in the amount of an estimated US 40 billion over three decades. The pipeline will send gas from Burma's west coast to China. Human Rights groups have highlighted the pervasive use of forced labour and human rights abuses by military and civilian personnel in Burma for the Yadana pipeline and other development projects.⁷⁵

US embassy cables leaked in 2010 suggest that Myanmar was attempting to build nuclear and missile sites, with the help of North Korea.⁷⁶

In 2012, US authorities lifted sanctions against two key Myanmar officials: Burmese President Thein Sein and Lower House of Parliament Speaker Thura Shwe Mann, in acknowledgement of their reform efforts. The US also lifted the ban on conducting financial transactions and investing in Burma, but continued to prohibit dealings with the Burmese military, the Office of Procurement or rebel groups.⁷⁷ The new authorisations introduced a new reporting requirement that included

companies which invested to disclose certain internal policies and procedures relating to the investor's stance on human rights, anti-corruption and bribery among other policies.⁷⁸

Although US sanctions were also lifted on a variety of products, the prohibition and restrictions remain with regards to importing jadeite and rubies mined or extracted from Burma, including any jewellery articles that contain such gems.⁷⁹ Similarly, in 2012, the EU suspended sanctions against Myanmar for one year recognising the positive changes in Burma. The restrictions had concerned trade and investment in various industries including logging and timber, precious metals and mining and other interests.⁸⁰ Human rights groups like Human Rights Watch and the US Campaign for Burma have expressed concern that the lifting of sanctions is premature arguing that reforms promised in Burma particularly with regards to serious human rights abuses have been tenuous at best. A UN report on human rights in Myanmar also warned that progress in releasing the more than 120,000 political prisoners has been erratic. Nevertheless, countries like Australia and Canada have followed the EU and US actions by lifting some sanctions against Burma in light of the substantial democratic reforms that have taken place in the country.⁸¹

North Korea

The international community has imposed sanctions against North Korea primarily to encourage North Korea to abandon nuclear development. North Korea has been under UN sanctions since its first atomic test in 2006, and those measures now include an arms embargo, a ban on luxury goods and travel bans and asset freezes against persons supporting North Korea's nuclear development.¹

The US has imposed sanctions against North Korea, to varying degrees, since 1950, attempting a carrot and stick strategy to control the regime's behaviour by imposing sanctions, lifting sanctions and providing aid.² Current US sanctions restrictions currently in place include a limited asset freeze, export and import restrictions, ban on registration or operation of vessels operating under North Korean flag or assistance to such vessels, and a ban on certain donations from the North Korean Government.³

While North Korea is also involved in the drug trade and the production and laundering of counterfeit bills, there is limited political will to impose full sanctions against North Korea, for fear of derailing fragile negotiations regarding North Korea's nuclear development. North Korea's drug trafficking activities

don't draw the same attention as its nuclear weapons programme, but there is concern that routes established for drugs and contraband are routes that can be used for smuggling other items, including weapons-grade plutonium.⁴

In 2002, the Democratic People's Republic of Korea (North Korea) acknowledged it had clandestinely developed facilities to enrich uranium, saying it was no longer bound by the terms of a 1994 accord that froze its old plutonium-based programme. The "six-party talks" were organised in response. Beginning in 2003, North Korea participated in a series of six-nation nuclear talks in Beijing, which included China, US, Japan, Russia and South Korea.⁵

However, North Korea withdrew from those talks in 2005, citing as a reason the US imposition of sanctions against *Banco Delta Asia*. In September 2005, the US Treasury designated *Banco Delta Asia*, a Macau-based bank, as a "primary money laundering concern" because of its laundering of North Korean money from counterfeiting and drug smuggling. US banks were banned from dealing with the *Banco Delta Asia* pursuant to Section 311 of the US Patriot Act. Macau banking authorities froze 50 North Korean accounts worth over US\$20mio.⁶ North Korea conducted its first nuclear test in October 2006. As a result, UNSCR 1718 was unanimously passed. The Resolution called on member states to ban exports to North Korea of nuclear, missile and chemical weapon technology and other military equipment, a ban on the export of luxury goods, as well as an asset freeze and travel ban against persons identified as supporting North Korea's weapons development. The resolution also called for the inspection of cargo ships for weapons of mass destruction.⁷ Authorities including the EU, US, Switzerland, UK, and Australia implemented sanctions measures against North Korea. North Korea agreed to return to the six-nation talks on its nuclear programme.⁸

In 2007, North Korea signed a tentative agreement during six-party talks in Beijing to shut down its nuclear programme in exchange for over US\$250mio worth of oil and aid.⁹ However, throughout 2008, North Korea announced it would not complete the dismantling of its programme if additional concessions were not made. The US Government reduced sanctions against North Korea and removed the country from the US list of State Sponsors of Terrorism in 2008.¹⁰

In 2009, North Korea exploded another nuclear device underground and launched a long-range missile over Japan and into the Pacific Ocean.¹¹ The UN Security Council issued UNSC Resolution 1874 (2009)

extending the arms embargo and calling on member states to prohibit financial services that could contribute to North Korea's nuclear or ballistic missile related programmes.¹² The EU created its own sanctions regime against North Korea, separate from UNSCR 1874, in the form of a regulation targeting close associates of Kim Jong Il. North Korea stated that the "US-led" sanctions were an act of war and that it planned to deploy its plutonium supply for military use.¹³

In 2010, the US banned the export of luxury goods to North Korea's elite, in response the 2009 nuclear test and North Korea's 2010 attack on the South Korean warship, Cheonan. 46 seamen died when the South Korean Navy ship sank off the country's west coast.¹⁴ An investigation carried out by a team of international experts from South Korea, US, UK, Canada, Australia, and Sweden concluded that the warship had been sunk by a North Korean torpedo.¹⁵ A 2010 UN report states that North Korea has been secretly supplying banned nuclear and ballistic missile components to Iran, Syria and Myanmar.¹⁶

Sudan

The US has enforced a comprehensive embargo against Sudan since 1997 for the Sudanese Government's support for international terrorism, ongoing efforts to destabilize the region, and human rights violations. The US sanctions prohibit virtually all transactions with the Sudanese government or where ultimate benefit is into Sudan, and imposes extensive controls on the exportation of US origin goods and technology to Sudan.¹⁷ Sudan has been on the US list of state sponsors of terrorism since 1993. It has housed terrorist bases and terror training camps since the 1990s when bin Laden and followers based operated training and financial operations from Khartoum. Following US Embassy bombings in Kenya and Tanzania in 1988, the US destroyed a facility in Sudan associated with chemical weapons and the bin Ladin network. While the Sudanese government has more recently cooperated with anti-terrorism efforts, it remains on the US list of Sponsors of Terrorism, primarily because of its inability to prevent groups such as Al-Qaeda and Hamas from using Sudan as a logistics base for operations. The Lord's Resistance Army conducted attacks in border areas in 2010, displacing 25,000 southern Sudanese. There is also evidence that Sudanese extremists have participated in terrorist activities in Somalia.¹⁸

The 2003 Darfur conflict compelled the UN Security Council to impose sanctions measures against Sudan that included an arms embargo and asset freeze against certain Sudanese officials responsible for the violence. Rebel groups in Darfur took up arms, accusing the

Sudanese government of oppressing non-Arab Sudanese in favor of Sudanese Arabs. The Sudanese government used oil revenues to employ advanced weaponry for use against civilian villages, and employed the Janjaweed to combat the rebels. The conflict caused mass migration, starvation, and rampant human rights abuses.¹⁹ In 2004-2006, the UN Security Council issued resolutions condemning human rights violations in Sudan's Darfur region and, in particular, the continuation of violence against civilians and sexual violence against women and girls.²⁰ The UK, Switzerland, Australia, Canada, New Zealand, Singapore and the US imposed targeted sanctions to implement the measures.²¹ The Darfur Conflict has connections to the tensions that gave rise to the Second Sudanese Civil War. In the late 1970s and early 1980s, oil had been discovered at the north-south border. Islamic fundamentalists in the north were not happy with the autonomy given to the non-Islamic majority in Southern Sudan under a prior agreement. In 1983, President Nimeiry declared all Sudan an Islamic state, terminating the Southern Sudan Autonomous Region. The civil war raged on for 22 years and resulted in over 2 million deaths.

A Comprehensive Peace Agreement (CPA) between north and south was signed on 9 January 2005 in Nairobi. Elements of the agreement include merger of military forces and a sharing of oil revenues and jobs, and the option of an autonomous South to opt out of Sharia law imposed in the North.²² On 9 July 2011, Southern Sudan became an independent state, as a result of a January 2011 referendum that took place as part of the CPA.²³ The new state formed by Southern Sudan is largely exempt from the US sanctions against the Government of Sudan. However, US persons (wherever located) are still prohibited from dealing in property and interests in property of the Government of Sudan, performing services that benefit Sudan, engaging in transactions relating to the petroleum or petrochemical industry in Sudan, and participating in exports to or imports from the new state that transit through Sudan. For example, US persons would not be able to facilitate payments from the new state to the Government of Sudan from the sale of Southern Sudanese petroleum as a result of a revenue-sharing arrangement.²⁴ Sudanese armed forces continue to threaten the peace with attacks on civilians in rebel-held areas, actions which human rights groups are calling war crimes.²⁵

Syria

Several governments have sanctioned Syrian government officials and agencies responsible for crackdowns on Arab Spring insurgents in 2011. In January of 2011, protesters began calling for political reforms and the

reinstatement of civil rights, as well as an end to the state of emergency which has been in place since 1963, to which the government responded with a series of bloody crackdowns. Many tens of thousands have died in the conflict²⁶ already. In 2011 the EU, Switzerland, Australia, Canada, and the US imposed an arms embargo, asset freezes and/or travel bans against Syrian President Bashar al-Assad and other senior Syrian officials, and Syrian government agencies. Additionally, the EU and US specifically sanctioned the Iranian intelligence services and commanders for providing equipment and support to help the Syria regime suppress protests.²⁷ As government violence against insurgents increased in 2011, the EU amended its sanctions measures against Syria to include a ban on importing or purchasing from Syria crude oil or petroleum products, as well as related transactions concerning transport, finance and insurance to include Syrian government property; a ban new investment in Syria; prohibiting services of any kind to Syria; and banned the dealing in petroleum or petroleum products of Syrian origin.²⁸

The ban on services prohibits financial services, including processing of payments, involving individuals and entities domiciled in Syria. These sanctions are akin to the US sanctions embargo against Iran and arguably prohibit, for example, accounts for individuals. Also, they prohibit the processing of trade transactions involving Syrian vessels or transhipments through Syria. The service ban makes the US sanctions against Syria broader in scope than sanctions imposed by the US against other regimes opposing Arab Spring protests.²⁹ For example, US 2011 sanctions against the Libyan government did not prohibit services involving all Libyan nationals. This US embargo is imposed on top of those US sanctions imposed against Syria for its terrorism support.³⁰ Designated by the US in 1979 as a State Sponsor of Terrorism, Syria has provided safe-haven as well as political and other support to a number of designated Palestinian terrorist groups, including Hamas, Palestinian Islamic Jihad (PIJ), the Popular Front for the Liberation of Palestine-General Command (PFLP-GC), as well as to Hezbollah in Lebanon. The operational leadership of many of these groups is headquartered or sheltered in Damascus. Syria allows terrorist groups resident in its territory to receive and ship goods, including weapons, in and out of the country. Weapons flow from Iran through Syria, and directly from Syria, to Hezbollah.³¹

In 2004, the US imposed tailored sanctions against Syria in response to actions by the Government of Syria in support of international terrorism, its occupation of Lebanon, its pursuit of weapons of mass destruction

and missile programme, and its actions to undermine US efforts to stabilize Iraq. Those sanctions included a ban on exports and re-exports to Syria, Syrian air flights and an asset freeze against persons supporting the Syrian governments terrorism support or weapons development.³²

In 2005, a terrorist bombing in Beirut, Lebanon killed 23 people, including former Lebanese Prime Minister Rafiq Hariri. Noting the involvement of high ranking Syrian government officials in the assassination plan, the UN Security Council adopted Resolution 1636, to freeze funds and economic resources of persons identified by the Security Council as suspected of involvement in the bombing. No targets were designated under these UN sanctions.³³ In 2005 and 2006, the EU and the US issued similar measures in response to the bombing.

In 2008, the US targeted persons benefitting from corruption under the Assad regime, in particular the cousin of Assad, Rami Makhluf, who used his close ties to the Assad regime to obtain improper business advantages in a number of industries. The justification for the sanctions was that corruption and cronyism entrenched a regime pursuing oppressive and destabilizing policies, including beyond Syria's borders, in Iraq, Lebanon, and the Palestinian territories.³⁴ Terrorism concerns have escalated in 2011 with the IAEA's announcement that Syria is building secret nuclear facilities capable of refining plutonium, which can be used to arm nuclear warheads. Syria has refused to cooperate with IAEA inspections. Syrian president Al-Asad has been a staunch defender of Iran's policies, including Iran's nuclear ambitions.³⁵ Syria's financial sector remains vulnerable to terrorist financing. An estimated 70% of all business transactions are conducted in cash and as many as 80% of all Syrians do not use formal banking services. Despite Syrian legislation requiring money-changers to be licensed by the end of 2007, many continued to operate illegally in Syria's vast black market, which is believed to be as large as Syria's formal economy. Regional hawala networks remained intertwined with smuggling and trade-based money laundering facilitated by corrupt customs and immigration officials raising significant concerns that the Syrian government and business elites could be complicit in terrorist financing schemes.³⁶

Finally, in 2012, the US under ITRSHRA, expanded sanctions against Syria focusing on human rights abuses reported to have been committed by the Assad regime against the Syrian people as a result of the two and half year conflict with rebel forces determined to force Assad to relinquish power.³⁷

Venezuela

With the death of President Chavez it remains to be seen how his successor, Nicolas Maduro, will be seen or act, whether Venezuela continues as before or charts a new less confrontational course. As a result of former President Chavez's actions the US has sanctioned certain high level Venezuelan officials for support of narcotics trafficking and terrorism groups, and has criticised Venezuela for supporting narcotics trafficking and terrorist groups and fostering an alliance with Iran. Venezuela is recognised as one of the principal drug-transit countries in the Western Hemisphere, located between the world's largest cocaine producer, Colombia, and the world's largest consumer of cocaine, the US.³⁸ A US Government Accountability Office (GAO) study reported a high level of corruption within the Venezuelan Government, military and law enforcement that has allowed that country to become a major transshipment route for trafficking cocaine out of Colombia.³⁹

In September 2011, US Government sanctioned four Venezuelan political figures, including military officers and Government officials political figures associated with Venezuelan President Hugo Chavez, for providing training and weapons and to the leftist Revolutionary Armed Forces of Colombia (FARC) and supporting the rebel group's narcotics and arms trafficking activities.⁴⁰ The FARC is a Colombian terrorist insurgency group that finances its operations through narcotics trafficking, extortion and kidnapping, and the US Government has designated it as a terrorist organisation.⁴¹ One of the four sanctioned individuals was a primary arms dealer for the FARC and a main conduit for FARC leaders based in Venezuela, according to the US Government. Two of the four used military and intelligence positions to establish an arms-for-drugs route with the FARC and coordinate security for the guerrillas.⁴² In 2008, the US government designated three high ranking Venezuelan officials as drug kingpins for providing material support to the FARC. The individuals were accused of protecting drug shipments and providing weapons and funding to the FARC. Venezuelan President defended the officials, and remained in office after the designations.⁴³ Hezbollah maintains a presence in Venezuela for fundraising activities. In 2008, the US designated Venezuelan diplomat Ghazi Nasr al Din for using his position to provide financial support to Hezbollah.⁴⁴ Also in 2008, Colombian authorities took action against a drug and money laundering ring in an international operation that included the capture of three people suspected of shipping funds to Hezbollah.⁴⁵ Venezuela and Iran are deepening a strategic alliance. Iran opened a bank in Caracas under the name Banco Internacional de Desarrollo C.A., an independent subsidiary of Export

Development Bank of Iran. In 2008, US Treasury's Office of Foreign Assets Control imposed economic sanctions against both banks for providing financial services to Iran's Ministry of Defence and its Armed Forces Logistics—the two Iranian military entities tasked with advancing Iran's nuclear ambitions.⁴⁶

President Chavez had opposed multilateral sanctions against Iran and has signed cooperation agreements with Iran in areas including, oil and gas, trade, and construction.⁴⁷ Media sources indicated that Iran maybe placing medium range missiles in Venezuela and Venezuela has agreed to allow Iran to establish a military base manned by Iranian missile officers,⁴⁸ soldiers of the Iranian Revolutionary Guard and Venezuelan missile officers. Venezuelan Government confirmed in 2009 that Iran was assisting Venezuela in the detection and testing of Venezuela's unmined uranium deposits.⁴⁹

Zimbabwe

Robert Mugabe has been in power since Zimbabwe's independence in 1980. Targeted sanctions have been imposed by the international community against Robert Mugabe and his associates.⁵⁰ In 2001, the US implemented under the US Democracy and Economic Recovery Act, which bars Zimbabwe from access to credit and debt reduction/indebtendness.⁵¹ Asset freezes and travel bans have been imposed by EU, US, Canada, Switzerland, and Australia. Since 2002, nearly 200 people who make up Mr. Mugabe's inner circle have been sanctioned, along with farms, agencies and corporations controlled by them.⁵²

Zimbabwe is also subject to an arms embargo. The US, EU and Canada restrict transfers of defence items and services to Zimbabwe.⁵³ NGOs have reported over the last decade grave human rights violations occurring under including arbitrary arrests, torture, censure of the press, and violent disruption of peaceful protests. Massive intimidation techniques have prevented free and fair elections. In 2005, NGOs accused Mugabe of rigging of the March parliamentary elections. The country's drought weary populace is made to fear that a vote for the opposition would result in violence or withholding of food aid. In 2008, Mugabe won the elections to his sixth term after his opponent, Morgan Tsvangirai, dropped out of a runoff election because Government enforcers were beating and killing his supporters. Various governments strengthened sanctions in response to this event, despite the fact that a power sharing agreement between the opponents was subsequently reached.⁵⁴

Section 4 Money Laundering Prevention Programmes

- Risk Based Approach, 283
- Risk Assessment, 285
- AML Programme, 295
- Sanctions Programme, 301
- Anti-Bribery & Corruption Programme, 306
- Anti-Fraud Programme, 310

Risk Based Approach

Whilst AML programmes should always reflect applicable legal and regulatory requirements, programme design should also seek to strike a balance between protecting the organisation's reputation, preventing and detecting money laundering with the need to ensure that legitimate business can continue to operate and expand and that honest law-abiding customers are not treated as suspected criminals. This balance is difficult to achieve but can only be done by careful analysis of the risks and vulnerabilities, for example, represented by particular customers, products and services and channels or jurisdictions or alternatively appropriate risk scenarios to a particular financial institution. Risk will always be present and it is impossible to create a situation where incidents will not occur and to attempt to do so would unduly constrain business and commerce. An effective and proportionate AML Framework therefore needs to target resources at those areas that are considered to represent the highest risk to an institution, with less, though adequate resources and scrutiny proportionately covering areas of lesser risk.

With an "all crimes" model recently adopted by FATF in 2012, AML frameworks should also consider the threats posed by the other predicate offences, for example see Part 1, Section 1, Predicate Crimes above, but also take note of any National Risk Assessments and prioritised areas of concern, and internal Risk Assessments, which for more details see below in this Section.

In addition to AML Frameworks or tailored AML Programmes, bespoke programmes should also focus on Sanctions Compliance, Anti-Bribery and Corruption and Anti-Fraud Programmes. Market Abuse Programmes usually form part of separate Compliance Programme but require attention and emerging is a need to consider a bespoke tax compliance programme. Terrorism Finance and WMD Proliferation Programmes are usually included with AML and Sanctions Compliance Programmes. For more details on these again see later in this Section.

Increasingly, many policymakers, regulators and AML professionals recognise that an approach (known as the risk based approach or RBA) is an effective and appropriate method of mitigating risk. Indeed FATF have enshrined the RBA in Article 1¹ of their revised 40 Recommendations in 2012 demonstrating the importance for countries and the public and private sectors. Whilst some jurisdictions have failed to adopt a RBA and retain a largely rules based approach to AML, they are increasingly in the minority. In some areas, such as Sanctions

Compliance or Terrorism Finance for example, there is more a reluctance to adopt an RBA and frameworks are largely based on prescriptive rules, creating a situation where institutions have a firm set of obligations and where a "zero failure" approach is the aspiration. Even here many institutions will supplement compliance with prescribed rules with further measures utilising elements of an RBA where risks can be identified and should be mitigated. Ironically, a rules based approach can be easier for the AML professional to work within given that it sets prescriptive standards that every institution must follow and it is therefore, clear to an institution what needs to be done and about what resources are needed to meet the obligations. A fully adopted RBA offers flexibility but can create a situation where threats, risks and counter measures are assessed differently from one institution to another. It is important that institutions retain this flexibility and should not be second guessed provided such a framework is reasonable and proportionate and takes into account the particular circumstances of that institution. Policy makers and regulators have here a challenge as there are not clearly stated rules against which they can judge an institution's performance, rather they place focus on the arrangements in place to prevent financial crime (which usually includes AML, Sanctions, Anti-Bribery & Corruption (ABC) and Fraud).

Under a rules based approach it is fairly clear whether or not an institution has met its obligations but the risk based framework means that assessing the level of compliance is less clear. For institutions, this can present a significant danger in that regulators who visit a number of different institutions may select what they regard as examples of "best practice" and then expect to see this replicated in other institutions irrespective of the other internal factors that should and must be considered before such a considered assessment can be made.

Often these "best practice" assessments and statements are simply assessments of "common practice" in other words, simply because a number of institutions are doing something in a particular manner it is assumed that this represents "best practice". Whilst "common practice" can be a guide to adopting new methods, the danger is that conventional wisdom is the architect of future AML framework design. Much common practice is designed to protect an institution against regulatory criticism and not always directed towards money laundering prevention. In reality, each institution must take the evidence it has available and make its own decisions based on the information it has, the customers it serves and the product and delivery channels which it supports. Given that peer assessment becomes a real guide for regulators, it becomes imperative that institutions

document their decisions, record the evidence that was reviewed, periodically revisit those assumptions and, wherever possible and practical, benchmark their assessments with other institutions.

Determining risk is neither a static discipline nor is it one that remains constant as it will continue to be influenced by external developments including political priorities or regulatory changes, business changes and changing criminal behaviour. For that reason, it is imperative that a framework is created within which such assessments and decisions can be made such that the framework can respond. The mechanism for assessing changes in risk and corresponding responses is the Risk Assessment.

Increasingly financial institutions will undertake Risk Assessments employing detailed models using both numerical assessments of relative, comparative or changing risks across a number of risk categories, for example, customer, country, products and services and channels and/or by using scenario based assessments and control effectiveness approaches.

Once risks are identified, how to combat them will be the responsibility of the financial institution. Of course, where legal and regulatory requirements exist, these will be followed but over and above this, a financial institution will adopt a risk based approach and so make a judgement as to the focus of its control environment and as to how many resources their programmes require to run effectively and efficiently. In justifying focus and spend, a financial institution should expect to be able to explain this but not to have this second guessed. The risk of legal or regulatory censure is usually a significant driver in making risk based choices but financial and reputational damage are also important. All are inextricably linked. Taking a Risk Based Approach therefore involves complying in full with applicable laws and regulations and acting beyond that on the basis of a firm's own definition of risk appetite and priorities, whilst remaining as competitive in the market place as possible.

The following programmes highlight the areas of coverage for AML Sanctions, Anti-Bribery and Corruption (ABC) and Anti-Fraud Programmes. Before each though comes, as it should, the Risk Assessment.

Risk Assessment

There is no shortage of literature on the (in)ability of human beings to assess risk properly. Collectively we have short-term memories along with a disinclination to forego short-term gains when we perceive risks to be distant or unlikely. The literature of how people view risk depending on context, group size and numerous other factors is extensive. Quantitative models have proven to be extremely useful in helping us quantify risks, understand observed phenomena, explore the sources and impacts of financial risks and develop tools and methods for managing risks. At best, models remove a great deal of bias and subjectivity from risk analysis as well as give us a measurement tool. The Basel Committee on Banking Supervision issued in June, 2013 a Consultative Document, entitled "Sound management of risks related to money laundering and financing of terrorism"¹ which includes the following on the importance and conduct of Risk Assessments.

"Sound risk management requires the identification and analysis of ML/FT risks present within the bank and the design and effective implementation of policies and procedures that are commensurate with the identified risks. In conducting a comprehensive risk assessment to evaluate ML/FT risks, a bank should consider all the relevant inherent and residual risk factors at the country, sectoral, bank and business relationship level, among others, in order to determine its risk profile and the appropriate level of mitigation to be applied. The policies and procedures for CDD, customer acceptance, customer identification and monitoring of the business relationship and operations (product and service offered) will then have to take into account the risk assessment and the resulting risk profile of the bank. A bank should have appropriate mechanisms to document and provide risk assessment information to competent authorities such as supervisors. A bank should develop a thorough understanding of the inherent ML/FT risks present in its customer base, products and services offered (including products under development or to be launched) and the jurisdictions within which it or its customers do business. This understanding should be based on specific operational and transaction data and other internal information collected by the bank as well as external sources of information such as national risk assessments and country reports from international organisations. Policies and procedures for customer acceptance, due diligence and on-going monitoring should be designed and implemented to adequately control those identified inherent risks. Any resulting residual risk should be managed in line with the bank's risk profile established through its risk assessment. This assessment and understanding should be able to be demonstrated as required by, and should be acceptable to, the bank's supervisor".

Risk Assessments have long been an expectation for example in the US where guidance can be found in the Federal Financial Institutions Examination Council ("FFIEC") BSA / AML Examination Manual,² where it is stated that management should:

...structure the bank's BSA/AML compliance program to adequately address its risk profile, as identified by the risk assessment...develop the appropriate policies, procedures, and processes to monitor and control BSA/AML risks. For example, the bank's monitoring systems to identify, research and report suspicious activity should be risk-based, with particular emphasis on higher-risk products, services, customers, entities, and geographic locations as identified by the bank's...risk assessment."

In Canada, FINTRAC, the Canadian FIU sees an AML Risk Assessment as one of the fundamental components of the risk based approach and a critical pillar in designing and implementing an AML Compliance Programme.³

In Australia, Austrac, cites four phases of an AML Risk Assessment: (i) Risk Identification; (ii) Risk Assessment; (iii) Risk Treatment; and (iv) Monitoring and Review and also provide tables and examples of how risk assessments can work.⁴

In the UK, The Joint Money Laundering Steering Group Guidance Notes outlines some of the considerations that should be taken into account when conducting a risk assessment, with taking a risk based approach being a core theme.⁵

1. The purpose of a Risk Assessment

The key purpose of AML risk assessment is to identify potential and specific money laundering risks facing a FI and how these risks are mitigated, by employing a structured methodology using both qualitative and quantitative analysis. The results of a risk assessment can be used for a variety of reasons, including:

- identify gaps or opportunities for improvement in AML policies, procedures and processes;
- make informed decisions about risk appetite and implementation of control efforts, allocations of resources, technology spend, etc.;
- assist management in understanding how the structure of a business unit or business line's AML compliance programme aligns with its risk profile;
- develop risk mitigation strategies including applicable internal controls and therefore lower a business unit or business line's residual or net risk exposure;
- ensure senior management awareness and reporting;

- ensure regulatory awareness and reporting; and
- assist management in ensuring that resources and priorities are aligned with its risks.

2. Frequency of Assessment and Periodic Updates

Undertaking an Enterprise-wide risk assessment is a complex and resource-intensive task. However, in order to fully appreciate the risk environment it is necessary to undertake one of these. The periodicity of the enterprise-wide risk assessment will depend upon a number of factors including: the type and extent of interim validation / verification that is undertaken; the results of the risk assessment; internal or external risk events; etc. Smaller FIs or FIs with an immature AML framework may choose to complete an enterprise-wide risk assessment annually, whilst this is likely to be too resource intensive for larger FIs.

Regardless of the frequency of an enterprise-wide risk assessment is undertaken, FIs are usually required to report annually on the status of the AML risk environment. This can take the form of the Annual Report or other reports. As such, one approach is to undertake a trigger-based interim validation, looking to highlight whether there has been any change to the risk environment that was previously identified. Any changes may result in the initiation of additional workstreams or highlight a need to undertake a more in-depth assessment. Additionally, ad hoc risk assessment may be performed, focusing on higher risk areas and the specific controls that have been implemented to address the given risk. The results from these ad hoc risk assessments can then be incorporated into the next regular AML risk assessment.

Whichever approach is chosen, FIs should ensure that their approach is clearly documented and approved by senior management. The methodology for the risk assessment must be clearly articulated, especially with regard to the bases for its conclusions, e.g. scoring / weighting, etc.

3. Ownership, Roles & Responsibilities

Senior management at a FI are overall owners of the risk environment and usually delegate the assessment of AML risk to the Legal and/or Compliance / AML Unit, who will usually have primary responsibility for the initiation and delivery aspects of the AML Risk Assessment, including methodology development, maintenance, periodic process / activity initiation and record keeping of completed assessments. Business line heads as well as other departments, e.g. IT, will also be required to contribute. The purpose of the risk assessment and the contribution required should be clearly outlined, with FIs considering whether to include spe-

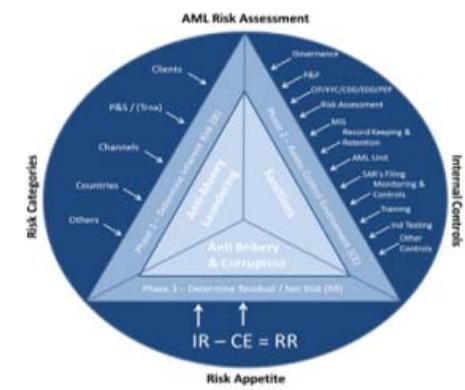

cific responsibility for the execution of and contribution to the risk assessment as part of the annual objective setting process for relevant staff

4. AML/Sanctions/Anti-Bribery & Corruption (ABC)

AML compliance units at most FIs will manage AML, Sanctions and ABC within a single department. As such, firms may choose to cover all three areas within a single risk assessment or more usually by three separate assessments, or a combination, for example, a combined AML and Sanctions Risk Assessment and a separate Anti-Bribery Risk Assessment. The same can be said for Fraud, though some FIs treat Fraud often as a distinctly separate risk management taxonomy whilst others see benefits in closely aligning the approaches. Areas such as insider dealing and market manipulation, increasingly becoming predicate offences to money laundering is usually assessed as part of the non-financial crime risk assessments conducted within an FI, usually by Compliance, separate from AML Compliance though approaches will be similar.

5. Conventional/Standard AML Risk Assessment Model

Whilst there are numerous ways to conduct Risk Assessments, increasingly the most common used by FIs can be described as the "conventional/standard model." The following diagram illustrates the practice:

In this Model a firm will apply an adopted methodology performing a structured approach to conducting a risk assessment. The risk assessment should cover the entirety of the business of the firm though may be conducted in parts or as part of a rolling cycle to focus on separate areas, e.g. divisions, units or specific business lines. The risk assessment should consider all

relevant inherent money laundering risk factors in order to determine its risk profile and in turn assess the nature of mitigating controls both from a design and operating effectiveness standpoint in order to arrive at the residual or net risk, which should be within the firm's established risk profile, essentially the firm's risk appetite. Whilst the Risk Assessment is the responsibility of the firm, the money laundering risk assessment will be designed and carried out usually by the competent AML unit, applying specialist knowledge and expertise alongside gathering relevant external and internal information. The risk assessment process can be considered in three Phases: Phase 1: Determine the inherent risk; Phase 2: Assess the internal control environment (both design and operating effectiveness); and Phase 3 Determine the residual/net risk.

Phase 1 – Inherent Risk Assessment

As no two firms are the same, inherent risk ratings may vary for financial institutions depending upon the size and scope of their businesses and the risks involved. In order to identify the particular inherent risks for a particular financial institution inherent risk across five risk categories are commonly employed which are described as follows:

1. **Clients;**
2. **Products and Services;**
3. **Channels;**
4. **Geographies; and**
5. **Other Qualitative Risk Factors.**

Risk categories are broad types of areas of risk faced by an organisation. These broad risk categories are then sub-divided into inherent risk factors that are derived from regulatory guidance or interest and industry leading practices. These multiple risk factors are included in each risk category and include a mix of both qualitative and quantitative criteria. Risk factors are the underlying causes or circumstances that led to reputation risk, regulatory or legal sanction and possible subsequent financial costs. Due to the nature of the particular business unit or business line's products and services and customer base, a risk based approach is used to calculate inherent risk. Each risk factor is assigned a score/ weighting which reflects the level of risk associated with that risk factor and the prevalence of that risk compared to the other risk factors.

Client Risk

For the purposes of assessing the inherent money laundering risk of a business division, unit or business line, the customer base and business relationship should be assessed. A number of client forms, industries, activities, professions and businesses, alongside other factors,

for example, perhaps the length of a client relationships can increase money laundering risks. The following categories can be used to stratify the customer base and to identify relative risks, which focus on client type, ownership, industry, activity, profession and/or business. Some or all of these categories may be relevant depending upon the particular division, unit or business line under review. Different customer types are assigned different risk scores depending upon the relative risk they pose. Each client type is assigned a risk score, depending upon the expected amount of AML risk, it carries relative to each other. For the business division, unit or business line in question, the volume (#) of clients that fall within each client type should then be determined/estimated. This data can be utilised to determine what percentage (%) of each business division, unit or business line client types are rated low risk versus moderate, versus high, versus higher risk, in order to determine the overall inherent client risk. A table of inherent risk scores for different client types is set out below:

Client Inherent Risk Ratings - Example 1

Clients (1) - Persons	Ratings
Individuals	
- High Net Worth	High
- Retail	Low
- Other	Mod
Entities	
Publicly Held Companies	
- Recognised Stock Exchange	Low
- Not Recognised Stock Exchange	High
Privately Held Companies	
- Operating Company	Low
- Non-Operating Company	Mod
- Bearer Share Company	High
Government Entities	
- Domestic/Low Risk Country	Low
- Moderate Risk Country	Mod
- High Risk Country	High
- Higher Risk Country	Higher
Financial Institutions/Banks and Reg Brokers	
- Recognised Stock Exchange & Compliant Country	Low/Mod
- Not-Recognised Stock Exchange and/or not Compliant Country	High/Higher

Client Inherent Risk Ratings - Example 2

Clients (2) - Special Categories with Increased Risks	Ratings
Politically Exposed Persons	
- Domestic	High
- International	Higher
Industry / Activity	
- Cash-Intensive Businesses	Med
- Money Services Business	High
- Charities & Non-Profit Organisation	High
- Intermediaries/Commission Agents	High
- Real Estate Agents	High
- High Value Goods Dealers	High
- Precious Metals & Stone Dealers	High
- Gatekeepers	High
- Casinos incl Internet Gambling	High
- Arms Dealers	High
- Private Military Firms	High

See Part 1, Section 2, Sub-section 2, Customer Risks

Products and Services Risk

Alongside "Clients" one of the other major risks is Products and Services Risks, where a financial institution will seek to identify its full portfolio of main products/account types and assign an inherent score, for example, low, moderate, high or higher to each main product/account type, based on its general inherent characteristics, and the degree of money laundering risk present relative to the other business products/account types.

For the business division, unit or business line in question, the volume (#) of products/ account types offered by the business, and (if available), associated account balances or where relevant turnover should then be determined/estimated.

This data can be utilised to determine what percentage (%) of each business division, unit or business line products/ account types are rated low risk versus high risk, in order to determine the overall inherent product risk.

A table of inherent increased risk scores for different Transactions and Product/Services is set out as follows:

Transactions Inherent Risk Ratings - Example

Increased P&S Risks (Transactions) 2	Rating
Significant/Unusual Cash/Cash Like	High
Pass-throughs	High
Unusual Wire Transfers	High
Smurfing	High
Suddenly Active	High
Other Unusual/Suspicious	High

Products & Services Inherent Risk Ratings - Example

Increased Products & Services Risks 1	Rating
Alternative Investment/Structured Products	Mod/ High
Trade/Export Finance	Mod/ High
International Private Banking/WM	High
International Correspondent Banking	High
- International Wires	High
- Pouch Services	High
- Precious Metals (Physical Delivery)	High
- Banknotes/Bulk Cash	High
- Payable-through Accounts	High
- Downstream Clearing	High
- Special Use Accounts	High
- International Brokered Deposits	High
Safe Deposit Services	High
Precious Metals (Delivery) Services	High
Unlimited Cards	High
Benchmark Indices Setting	High

See Part 1, Sections 2, Sub-section 3, Products & Service (incl Channels) Risks

Channels Risk

Some delivery channels/servicing methods can increase money laundering risk because they increase the risk that the division, unit or business line as appropriate does not truly know or understand fully the identity and activities of the Client. Consequently it should be assessed whether and to what extent the method of account origination or account servicing, such as anonymous account opening or the involvement of third parties, including intermediaries could increase the inherent money laundering risk.

For this risk category the business division, unit or busi-

ness line will then determine / estimate the percentage (%) of accounts that are rated low risk versus moderate, versus high versus higher risk, in order to determine the overall inherent channels risk.

An example table of inherent risk scores for different Channels risk factors is set out as follows:

Inherent Risks for Channels Risks - Example

Channels Risk	Rating
Account Origination	
Solicited	Low
Unsolicited (incl walk-ins, mail-ins etc)	High
Account Servicing	
Face-to-face	Low
Only non-face-to-face (incl mail, phone, text, video, internet)	High
Only non-face-to-face via Intermediary incl Gatekeepers	Mod
See Part 1, Section 2, Sub-sections 1, 2 & 3	

Geography/Country Risk

Identifying geographic locations that may pose a higher risk is a core component of any inherent risk assessment and the business division, unit or business line will seek to understand and evaluate the specific risks associated with doing business in and/or opening and servicing accounts and/or offering products and services and/or facilitating transactions involving certain geographic locations. Geography/Country risk may also be considered together directly with some of the other risk factors in other risk categories, for example, in Clients for financial institutions, and in Products and Services for Transactions. With respect to the location of the business division, unit or business line, the geographic/ country risk will also be analyzed, which will also include its subsidiaries, affiliates and offices, both internationally and domestically. The aim is to identify what percentage are located in low versus moderate, high or higher risk geographies/countries. For clients, the aim is to identify the number (#) of its clients within each country. This data will then be utilised to determine what percentage (%) of the clients are located in low versus moderate, high or higher risk geographies/countries. In order to map geographies/countries into different risk ratings, a firm's own country risk model or equivalent third party vendor product appropriately reviewed should be utilised. It may also be useful to consider in country hotspots or regional hotspots. An example table of inherent risk scores for different Geography/Country risk factors is set out below:

Inherent Risks for Geography Risks - Example

Geographies/Country Risk	Rating
Own Bank/FI Locations	
Higher Risk Countries	Higher
High Risk Countries	High
Moderate Risk Countries	Mod
Low Risk Countries	Low
Client Locations	
Higher Risk Countries	Higher
High Risk Countries	High
Moderate Risk Countries	Mod
Low Risk Countries	Low

Other Qualitative Risk Factors

Additional risk factors can increase operational risks and contribute to an increasing or decreasing likelihood of breakdowns in key AML controls. Qualitative risk factors directly or indirectly affect inherent risk factors. For example, significant strategy and operational changes, such as the introduction of a major new product, or service, a merger or an acquisition, opening or closing in a new location, may affect the inherent risk. Whilst these changes may well require the establishment of and/or the applicability of existing or new internal controls, given that these controls may take some time to become effective, the division, unit or business line will need to assess whether the inherent risk may have temporarily increased or changed. The main "Other Qualitative Risk Factors" include:

Inherent Risks for other Qualitative Risks - Example

Other Qualitative Risk Factors	Rating
Customer Base Stability	L/M/H
Integration of IT systems	L/M/H
Expected Account/Customer Growth	L/M/H
Expected Revenue Growth	L/M/H
Recent AML Compliance Employee Turnover	L/M/H
Reliance on Third Party Providers	L/M/H
Recent/Planned Intro of New P&S	L/M/H
Recent/planned acquisitions	L/M/H
Recent Special Projects & Initiatives (eg Remediations; Eliminations of Backlogs, Offshoring etc)	L/M/H
Internal Audit or Other material findings	L/M/H

Standardised Industry Inherent Risk Ratings

Whilst business divisions, units and/or business lines' inherent risks can be ascertained by the application and aggregation of risks relating to Client, Products and Services, Channels, Geography/Country and other Qualitative Risk Factors, in many cases, unless unusual or specific additional risks are presented, it is likely that certain types of banking businesses will be rated lower than others, and alternatively, others higher of course.

Whilst standardised or relative ratings for banking businesses are useful, they should not solely be used in the absence of inherent risk assessments. For a table of standardised inherent risk ratings for the most important banking businesses, see below:

Standard Inherent Risk Ratings (Major Bank/FI Businesses) - Example

Standard Inherent Risk	Rating
Asset Management	Low/Mod
Brokerage	Mod/High
Commercial Banking	Mod-High
Correspondent Banking	High
Credit & Other Card Banking	Low/Mod
Investment Banking	Mod
Retail Banking	Mod/High
Wealth Management / PB	Mod/High

See Part 1, Section 2, Sub-section 3, Products & Services (incl Channels) Risks above

AML Control Effectiveness Categories	
1	AML Corporate Governance: Management Oversight and Accountability
2	Policies and Procedures
3	Customer Identification Programme ("CIP"); Know Your Customer ("KYC") Customer Due Diligence ("CDD") Enhanced Due Diligence ("EDD") Politically Exposed Persons ("PEP") etc
4	Risk Assessment
5	MIS / Reporting
6	Record Keeping and Retention
7	Designated AML Compliance Officer/Unit
8	Detection and SAR filing
9	Monitoring and Controls
10	Training
11	Independent Testing and Oversight; and
12	Other Controls

Within each of these areas, an assessment is made through answering a list of questions. Each question covers both aspects; i.e. (i) design and (ii) operating effectiveness and focusses on both written policies and procedures but also processes and controls and how they are carried out.

Similarly, as with inherent risk and with risk factors above, each response to questions posed and to each area is assigned a score which when aggregated reflects the relative strength of that control. Each area is then assigned a weighting based on the importance that the institution places on the area scored. Using a standard 3 tier model rating scale, the internal controls can be assessed and scored for example as either Strong; Moderate or Weak.

Legal/Compliance/AML Unit Override

After completing the assessment of the risk and control categories, legal/compliance/AML unit should conduct a data quality review and at this stage should consider whether to override the inherent risk rating or the control effectiveness rating of any factor or category. Whilst it is easier to justify an increase in the inherent risk rating and/or a decrease in the control effectiveness rating the reverse should also be possible though in either case the model may need to be reviewed if the changes are very significant. In all cases the rationale behind such an override must be thoroughly documented, supported and approved by someone with appropriate authority. In addition to providing for

inherent risk scores, or internal control scores, trending indications can also be used, for example using the scale: increasing; stable; and decreasing.

Phase 3 - Arriving at the Net - Residual Risk

Once both the inherent risk and the internal control environment have each been established, the residual/net risk can be determined. Residual/net risk is the risk that remains after controls are applied against the inherent risk. It is determined by balancing the level of inherent risk with the overall strength of the internal controls.

The residual risk rating is used to assess whether the AML risks within the financial institutions are being adequately managed.

Using a standard three tier rating scale, the Residual Risk can be rated as High; Moderate or Low.

Residual Risk Determined: Example			
	Inherent Risk	Internal Controls	Residual Risk
Residual/ Net Risk	Low	85-100% Strong	Low
		75-84% Mod	Low
		Below 75% Weak	Mod
	Moderate	85-100% Strong	Low
		75-84% Mod	Mod
		below 75% Weak	High
High	High	85-100% Strong	Mod
		75-84% Mod	High
		Below 75% Weak	High

i) **Low Residual Risk** – The overall inherent risk of the bank/ business unit/business line, based on the clients, products/services, channels, geographies and other qualitative factors, is low and the mitigating internal controls are strong or moderate OR the inherent risk is moderate and internal controls are strong.

ii) **Moderate Residual Risk** – The overall inherent risk of the bank/ business unit/business line, based on the clients, products/services, channels, geographies and other qualitative factors, is moderate and the mitigat-

ing internal controls are weak OR the inherent risk is moderate and internal controls are moderate OR the inherent risk is high and the internal controls are strong.

iii) **High Residual Risk** – The overall inherent risk of the bank/ business unit/business line, based on the clients, products/services, channels, geographies and other qualitative factors, is high and the mitigating internal controls are moderate or weak OR the inherent risk is moderate and internal controls are weak.

Given the above methodology: i) A strong control environment can lower the residual AML risk in comparison to the inherent risk; ii) If the bank/ business unit/business line receives a high rating of inherent AML risk, it can never achieve a residual AML risk rating of low; and iii) In order to improve its residual AML risk in comparison to the inherent AML risk, the requirements for AML controls are commensurate with the results of the inherent AML risk assessment (i.e., stronger controls are required if the bank/ business unit/business line is assessed as having high inherent AML risk).

Reporting & Communication of Results

The results of the AML Risk Assessment, including the overall rating of the bank/ business unit/ business line as appropriate should be communicated by the legal/compliance/AML unit as appropriate to respective senior management, including with respect to the overall results for the firm to the firm's most senior management, the board of directors, internal audit and as requested to regulatory and supervisory authorities.

Across the industry, there has also been an increased focus on the levels of Operational Risk Capital held and the results of the Risk Assessment may be a useful input into the Operational Risk Capital calculation.

Note on Links to Customer Risk Rating Models

As financial institutions develop their Risk Assessment approaches consistently measuring risk in relation to established risk categories; for example geographies, products & services, channels, transactions and clients, these risk categories should also be taken into account and a model established to risk rate individual customer relationships.

Note on Links to Risk Based Approach

Once risks are identified, how to manage these should be a question for the financial institution provided as a minimum existing applicable laws and regulations are complied with. A financial institution will adopt a risk based approach to mitigate risks to match a net risk or risk appetite that it is satisfied with.

Other Approaches – Scenario Based Approach

As referred to above whilst it is increasingly common to use the “conventional/standard model” described above to approach Risk Assessment, other approaches are possible and valid. One such approach is the “Scenario Based Approach”.⁶

Whilst quantitative risk assessment methodologies have their place and form an important part of an AML Programme, we have certainly learnt from recent events that overreliance on historical data and analytical models may actually lead to overconfidence, recalling of course that many have a critical view of financial models and risk management processes and techniques, that failed to avoid the very unpleasant surprises, that have dominated the financial services industry leading up to, including and following the start of the global financial crises.

Still under any model we are not likely to avoid unpleasant surprises. We must nevertheless strive to understand the data we have and make careful observations so we may identify as many risks as possible. Quantitative models are an integral tool in promoting our understanding of the risks we face, and allow us to measure the residual or net risk after evaluating the strength of the control environment and to thereby seek to operate within acceptable risk limits. These quantitative risk models do have their limitations when it comes to considering very high-impact events. This is where scenario analysis can help as an additional risk management tool.

Scenario analysis follows a systematic process to create a set of possible events that may have a significant impact on a firm, for example tail risks amounting to stress testing. Scenarios are arrived at in different ways though usually by a team composed of key decision makers, experts, and/or stakeholder representatives. As they focus on areas of uncertainty and the potential for unexpected future tail events, scenarios provide a perspective not captured through analysis based on past data.

Scenario analysis has been used by both the public and private sectors for more than 25 years to manage risk and develop robust strategic plans in the face of an uncertain future. In certain industries, however, such as airlines, mining and nuclear power generation, operational losses can be truly catastrophic, involving deaths, injury and widespread destruction.

In contrast, in the finance industry the worst loss that can occur to a single firm may be its bankruptcy, as for example in the case of Barings or Lehman Brothers. However, financial sector stability and the ability for banks in a jurisdiction to be able to transact, settle and

clear transactions is of course a much bigger concern. In safety conscious industries, such as airlines, mining and nuclear power generation risk management is long established and well developed.

While the terminology is slightly different referring to safety management and not risk management, referring to ‘hazards’ rather than ‘risks’, and ‘containment’ rather than ‘mitigation’ its objectives are the same – the identification of potentially disastrous events and the reduction of the likelihood and impact of major events.

Scenario analysis has long been used by such industries and the tools and techniques used in such safety conscious industries are increasingly applicable to and being used also in the finance industry and, in particular, in connection with Operational Risk Management as defined by Basel II.

The use of scenario analysis is one of four approaches endorsed by the Basel Committee on Banking Supervision in its 2004 paper ‘Revised Framework for the International Convergence of Capital Measurement and Capital Standards’, which specified the definitive rules on capital charges for Operational Risk under Basel II (Basel 2004);⁷ alongside the use of internal loss data; relevant external loss data and bank-specific business environment and internal control factors and scenario analysis were each accepted together as tools to be used to qualify to use the Advanced Management Approaches (AMA), where Basel II requires that a bank’s internal measurement system must “reasonably estimate unexpected losses based on the combined use” of these four “fundamental elements”.

In their final proposal, the Basel Committee stressed the importance of ‘qualitative standards’ for banks that wish to use an AMA for management of their operational risks. However, other than urge that an Operational Risk Management (ORM) system must be “conceptually sound and implemented with integrity”, the Basel Committee gave few clues as to what such a ‘system’ might look like. Part of the reason for this was to allow banks to create an “internal model” that would better fit their unique operations, people and processes. Certainly an internally evolved system is likely to have a higher level of acceptance than a “one size fits all” prescription.

Scenario analysis and stress tests based on consideration of shock events and their possible repercussions can provide useful information for risk management purposes as well as regulators and other stakeholders. By careful selection, construction and analysis of scenarios unfolding over a period of time, a more holistic picture of the firm’s risk position can be created. Additionally, because such scenarios have at their heart a story-line, the com-

munication process with key stakeholders is less abstract than discussions focused on distributions, tails and other mathematical constructs.

The assessment of the relevant inherent risk facing a business can be determined by the nature of the business undertaken and the risks associated with that business, in other words – how that risk may actually occur given operations of the business. The inherent risk assessment can therefore be conducted at a scenario level. The scenarios represent ways in which an AML risk may crystallize. They are and can be considered to include significant long term events but can also be broader and more comprehensive.

The scenario approach allows a communication to occur in a language that will facilitate managements understanding of the risk itself and is likely to be compatible with common operational risk management approaches. The inherent risk assessment can be broken up into 3 parts: Part 1: Build the Scenarios; Part 2: Score the Scenarios; and Part 3: Determine the Inherent Risk.

Part 1 - Build the Scenarios

In this first part, a population of risks, or scenarios, possible events are created that may have an impact on a firm and/or may occur frequently. Most firms will already have a number of scenarios probably within the firms operational risk framework and these can be mapped to the AML related taxonomies, for example: for financial crime risks these may include separate assessments for AML, Sanctions, Anti-Bribery & Corruption. Examples of relevant scenarios are set out below:

Taxonomy	Scenario Examples
ABC	The risk that third parties that perform services for or on behalf of the bank or are associated with the bank pay bribes / confer undue advantage to public officials / PEPs in order to obtain or retain business or an advantage in the conduct of business for the bank.
AML	The risk that the bank on-boards a shell bank without identifying the increased money laundering threat and in contravention of regulation and policy.
Sanctions	The risk that the bank enters into or maintains business relationships or facilitates transactions with parties that are sanctioned entities.

See also Part 1, Section 2, Sub-section 2, Scenarios in P&S Risks

Part 2 – Score the Scenarios

In order to score the scenarios, a number of approaches can be taken. One example uses Impact and Relevance scoring models. The scoring model will determine whether the scenario has a low or high risk for frequency or relevance and a low or high risk for severity or impact, by applying a 1-4 rating scale for five categories for Relevance and four categories for Impact where 1 is low relevance and 4 is high relevance and 1 is low impact and 4 is high impact.

For **Relevance** factors the following can be considered:

- Regulatory Focus - assesses recent enforcement activity or regulatory interest in the area in the past 24 months.
- Business Activity - assesses whether the risk could crystallise given the day to day activities performed by the business
- Market and Product Profile - assesses the relevance of the risk given the products, markets and execution channels offered
- Client Profile - assesses the risk related to the client profile of the desk
- Personal Incentive - assess the likelihood of receipt of personal benefits which may incentivize behaviour that crystallised the risk

Where appropriate, these impact factors should also include the level of impact from a financial perspective such as regulator fines and penalties, costs of compliance and remediations as well as other civil and criminal fines and penalties.

For **Impact** factors the following can be considered:

- Regulatory Impact - assesses the level of impact from a regulatory perspective regulatory impact if the risk were to crystallise
- Reputational and Media Impact - assesses the potential reputational impact, including media coverage, if the risk were to crystallise

Once each scenario has a Relevance score and an Impact score these will be combined (for example RxI) to produce a gross risk figure for that scenario. For example if a scenario scored the maximum on both relevance for each factor (i.e. $4+4+4+4=16$) and impact for each factor ($4+4=8$) then combining the two figures (i.e. $16 \times 8 = 128$) will produce the maximum score possible, i.e. 128.

Part 3 - Determine the Inherent Risk

The total inherent risk score is derived by adding all inherent risk scenario scores and dividing by the number of scenarios. The total possible score (128xthe total number of scenarios) is then divided up into low,

Moderate and High possible outcomes, for example 80-100% of max is High: 40-80% of max is Medium and 0-40% of max is Low.

The inherent risk score for the bank, business unit or business line can then be used/taken and the internal control environment assessed and the residual risk determined as in the conventional/standard model above.

8. Risk Assessment and Risk Appetite

A Firm's AML Risk Assessment, should be designed by subject matter experts within the specialist unit responsible, for example, Compliance, AML, etc. and endorsed by the Firm's Senior Management. The same applies to other Risk Assessments, including Sanctions and Anti-Bribery and Corruption.

The result of the AML Risk Assessment will explain the current net AML risk being assumed by the Firm.

Senior management will need to determine whether the net risk is equal to the firm's risk appetite for AML Risk or whether the net risk exceeds the Firms risk appetite. In the latter case, measures will need to be agreed to be taken in order to either reduce the inherent risk or strengthen the control environment to ensure the net risk comes back into line with the firm's risk appetite. Alternatively, it may lead to discussion as to whether the firm's risk appetite is correctly positioned. The importance of senior management's involvement is especially illustrated here as a firm's risk appetite is a key influence upon its strategic goals and drivers.

A Firm's risk appetite may also be calibrated against other factors outside of the AML Risk Assessment Programme. For example, a set of scenarios and/or examples of risks/unwanted events which are relevant for the firm can be described and articulated to include a threshold impact amount, e.g. an acceptable level of loss per annum as a result of civil litigation.

Nevertheless, an example set of scenarios that could form part of a risk appetite evaluation and discussion with senior management could include defining expectations (risk appetite) and reporting on success and/or shortcomings (net or residual risk) with respect to the following risks: reputation, regulatory, civil liability and criminal liability.

a) Reputation Risk Damage - reputation damage can arise in numerous ways which affects the good reputation of a firm. A firm's reputation in this area is usually negatively affected by the announcement of a serious investigation into money laundering, usually in connection with client accounts and/or transactions, which

has or is likely you have a significant financial impact through regulatory, civil or criminal monetary fines and penalties. Reputation can also be negatively affected by existing and prospective clients, where negative allegations, including criminal allegations are made, for example, banking corrupt Politically Exposed Persons, facilitating terrorist finance transactions or dealings with questionable regimes, etc.

b) Regulatory Risk Damage - regulatory rules are constantly evolving and expectations increasing as to what a reasonable risk based AML programme looks like. Examination and testing experiences are also increasing in number, frequency, depth and intensity. The standard expected by regulators has largely shifted from accepting good or common practice to expecting the highest implemented standards as the norm. Matters once considered relatively minor, are increasingly considered material and matters once considered material requiring attention are increasingly considered material and requiring immediate attention. Costs for remediations and loopbacks, before fines can be substantial. Regulatory fines and penalties are being much more commonly levied for violations, often involving a number of regulatory agencies who take action for the same or similar issues. Part of this action is also likely to involve a commitment to undertake ongoing actions, including having a team appointed by regulators to be focused on ongoing monitoring of remediation of actions in situ at the firm.

c) Civil Liability Risk Damage - with civil class action lawsuits increasing and following investigations, fines or penalties levied in particular in connection with Sanctions matters, or terrorism finance cases as well as financial fraud liability for constructive trust, or civil action for failing to comply with a bank mandate, the possibility of legal damages being incurred is increasing.

d) Criminal Liability Risk Damage - whilst once very exceptional the prospect of criminal liability risks for AML weaknesses at a financial institution can no longer be discounted. The phrase "too big to jail" is one that grates amongst many who advocate criminal prosecutions and individual criminal liability as the only way to ensure satisfactory focus and full compliance by financial institutions with laws, regulations and expectations.

Whichever approach is chosen, and indeed both are possibly most useful operating in tandem then these must be endorsed by senior management, who will set and agree as well as monitor and revise as appropriate the AML risk appetite of the firm.

AML Programme

Anti-Money Laundering, which today often may include Sanctions Compliance, Anti Bribery and Corruption and Fraud Prevention Programmes have developed significantly over the last ten years or so. Starting as largely rules-based and focusing on automated screening and transaction reporting, involving few dedicated staff who undertook their responsibilities alongside other roles, it has evolved into an ever flexible risk-based operation, in the larger firms, employing hundreds of staff.

The following are the most important component parts for any successful Anti-Money Laundering (AML) programmes as expressly mandated, for example under S.352 USA Patriot Act 2001 which requires all financial institutions to establish AML programmes which, at a minimum, must include the following:

AML Programme - Core Elements	
1	Policies, procedures and controls
2	Designated compliance officer
3	Training programme for employees
4	Independent audit function to test the programme

Whilst each programme will include these elements the exact form of programme adopted by a financial institution will vary based on its own type of business, the size and complexity of its operations, the breadth and scope of its customer base, the number of employees, its risks and vulnerabilities to money laundering and the firm's resources.

Nevertheless, certain minimum standards must be a part of any adequate programme. For additional specifics relating to Sanctions Compliance, Anti Bribery & Corruption and Fraud Prevention see later in Part 1, Section 4 for details.

The programmes, whilst likely designed by the specialist Compliance AML unit, the business environment and the risk appetite needs to be set by senior management including the board and/or executive management. These bodies are responsible for the "tone from the top" defining the firm's values, behaviour and the culture that is needed to support an environment that puts sustainable, positive outcomes ahead of short-term gains. AML Risk Management may fit within existing governance arrangements where executive committees take responsibility for risk management in the first line and compli-

ance/AML units own the monitoring responsibilities for the control functions as the second line. Some firms may decide to establish dedicated AML risk committees to ensure AML risk receives a high level of focus.

First line of defence

As the first line of defence, management have responsibility for managing the ML/TF risk within their particular business area on an ongoing basis. The front office with the help of the infrastructure and support functions is considered to be the first line of defence in managing risk exposures for the firm. Whilst the front office is tasked with being a revenue generating section of the business, this needs to be balanced by the effective management of the risk the firm faces. Regulators have made it clear that they expect the front office to own and be held accountable for ML/TF risk within the business. As it is the front office that deals directly with or is accountable and responsible for the customer, the frontline needs to demonstrate that it is complying with ML/TF standards of due diligence and scrutiny. Management in the first line of defence have responsibility for monitoring the activities within their business and escalating where they do not.

It is important to clearly define the frontline responsibilities, as otherwise there may be an over-reliance on the second and third lines of defence. Where management in the front office do not recognise part of their role is risk management, this will inhibit front-to-back control and give rise to a weak culture and negative outcomes.

Second line of defence

The second line of defence is responsible for providing technical advice and monitoring the performance of the business against the ML/TF risk priorities set out by the board.

The AML Compliance control functions that form the second line should provide independent oversight, validation and verification of the management of risks by the business lines. They are also responsible for helping to define and challenge the risk framework, monitoring the risk profile of the business and ensuring that the business applies the framework consistently. The second line of defence monitors compliance with any directions and/or strategy set out by the board, investigates breaches, and reports directly to appropriate senior risk committees on the results of their work.

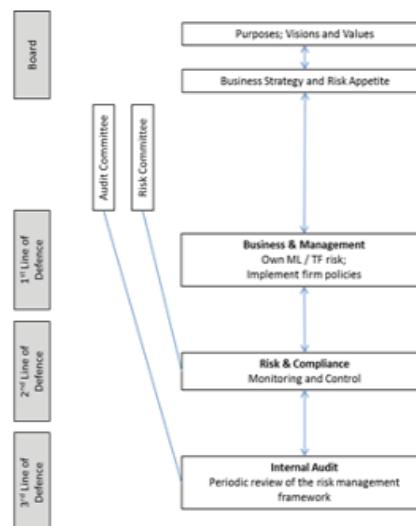

Third line of defence

The third line of defence is provided by an organisation's internal audit function. The internal audit function is responsible for providing independent assurance on the ML/TF risk-management framework, considering the

mechanisms in place within the first and second lines of defence and the extent to which these can be relied upon. It is independent of the business and the control functions within the second lines of defence.

Work performed at each level of the risk management framework may identify a need to revisit how ML/TF risk is managed and may also give rise to a need to reconsider the level of ML/TF risk the firm is exposed to. Communication from the Board on their expectations and demonstration of a tone from the top that holds individuals accountable for outcomes will help support a strong conduct risk culture throughout an organisation.

Three Lines of Defence Model for Effective Risk Management

1. Policies, Procedures and Controls

The starting point for any FI is to adopt a policy statement that clearly outlines the firm's policy against money laundering and its commitment to follow all applicable laws and regulations to ensure that its business is not used to facilitate money laundering. The policy statement should also make clear that all employees of the firm have a responsibility to follow the firm's written anti-money laundering procedures and controls, and to abide by all applicable laws and regulations involving anti-money laundering programmes. The policy statement also should discuss the consequences of not following these procedures.

Policies are usually drafted by the Compliance or specialist AML function. They are a representation of a firm's stance on managing its risks associated with legal and regulatory obligations whilst factoring in financial and reputational considerations. It can often be the case (see Sanctions section) where a firm's policy stance on an issue can go above and beyond legal and regulatory requirements and this is a firm's prerogative. Many firms with global operations look at their policies as establishing a global minimum standard and so policies must be adhered to except where local law/regulation requires a higher standard. This approach ensures that firms continue to undertake business always in accordance with the laws and regulation of the jurisdictions in which they operate.

Policies will usually reference other policies that should also be read alongside. Each policy will also refer to underlying procedures, which explain in more detail how a firm is actually able to comply with the policy. Policies and procedures must be clearly written, avoiding ambiguity and apply to all employees (including subsidiaries/related entities).

In drafting policies and procedures a firm may look to guidance provided by international bodies such as FATF, the Wolfsberg Group etc. but must ensure that the policies and procedures adequately direct a firm's AML approach and protect the firm from breaching its legal and regulatory obligations.

Policies should go through a rigorous development process and ensure that they receive the support of the senior management of a firm. Senior management, including the board, is responsible for establishing the 'tone from the top', instilling a culture of compliance, ensuring appropriate resources and expertise are in place to implement an effective programme; communicating regularly that commitment through internal and external channels; addressing serious matters with appropriate consequences for breaches; and, making ongoing assessments as to the competence, judgment and attitudes of senior management or persons in positions of supervisory control. In the absence of such a culture, compliance with policies is generally unsuccessful and as a result risks are not effectively managed.

The firm's procedures and controls should enable appropriate personnel to form a reasonable belief that they know the true identity of each customer; recognise suspicious customers and transactions; and require personnel to report suspicious or unusual activity to appropriate supervisory personnel, including senior management, and to regulatory and governmental authorities when appropriate. The firm's procedures and

controls should also ensure that the firm maintains an adequate audit trail to assist law enforcement agencies in any investigation. The key components of these policies, procedures and controls are as follows:

A. Customer Identification Programme

As part of its AML programme, a FI should adopt a written Customer Identification Programme (CIP). As part of the CIP it should specify the identifying information the firm will require from each customer. Although the type of identifying information a firm may require will vary based on, among other things, the nature of the firm's business and the type of customer, a firm must obtain certain minimum information prior to opening an account, for example for an individual customer, the customer's name, date of birth and a residential or business address and for non-natural persons, the customer's name and principal place of business, local office or other physical location. The CIP must also include risk-based procedures to verify the identity of each customer to the extent reasonable and practicable. Verification may occur within a reasonable time before or after the customer's account is opened. Accounts may be verified using documentary methods, non-documentary methods or a combination of both. The CIP, however, must describe under what circumstances the firm will use each of these methods. In addition, the CIP must identify situations where the firm will require additional verification based on the firm's risk assessment of the new account. The firm's CIP should also identify the documents that will be used for documentary verification.

A firm's procedures should also include a mechanism to identify potentially high-risk accounts in the account opening process. Although attempts to launder money or finance terrorism can come from numerous sources, firms should be aware that certain customer types, exposures to certain countries and usage of particular products and services may pose a greater risk (see Risk Assessment below).

The firm's CIP must also include procedures for determining whether a customer appears on any applicable lists of known or suspected terrorists or terrorist organisations issued by competent authorities

If a firm intends to reasonably rely on another financial institution, it must specify in its CIP when the firm will satisfy its obligations by relying upon another financial institution (including an affiliate).

B. Detection and SAR Filing

Another essential component of an effective anti-money laundering compliance programme is a set of systems

and procedures designed to detect and report suspicious activity. As with most components of a firm's compliance programme, the manner in which a firm monitors for suspicious activity will vary based on the firm's size and the nature of its business.

For some firms, appropriate manual monitoring of transactions in excess of a certain dollar amount may constitute acceptable review for suspicious transactions, while other firms may need to implement an automated monitoring process. Examples of suspicious transactions include those that have no business or apparent lawful purpose, are unusual for the customer, or lack any reasonable explanation. As discussed above, recognizing suspicious transactions requires familiarity with the firm's customers, including the customer's business practices, trading activity and patterns. What constitutes a suspicious transaction will vary depending on factors such as the identity of the customer and the nature of the particular transaction.

Since suspicious transactions may occur at the time an account is opened or at any time throughout the life of an account, firms must train appropriate staff to identify suspicious behaviour during the account opening process and monitor cash activity and trading activity in order to detect unusual transactions. Identifying suspicious activity may prove difficult and often requires subjective evaluation because the activity may be consistent with lawful transactions.

C. Risk Assessment

A firm must identify where financial crime may occur within the organisation. A risk assessment should be systematic and performed on an annual basis or as required. For more details on Risk Assessments see above. Whilst all aspects of financial crime should be subject to risk assessment in order to assess a firm's inherent and net risk of its activities, its products and services being abused and the risks posed by its customers. Risk Assessments may be carried out for major business divisions, business units or lines as deemed appropriate.

The Risk Assessment may also be leveraged to risk rate the firm's customers and used to determine the approach to be taken in terms of the required due diligence and monitoring will be fixed. A basic level of due diligence is required for those clients determined to pose the lowest risk, with an increased or enhanced level of due diligence required for those clients determined to pose a higher risk as well as other control measures that will need to be enhanced. Various factors will be taken into account when deciding the appropriate risk category for a client. The following table below highlights the main areas of focus which together via an appropri-

ate scoring model, appropriately weighted can be used to risk rate clients.

Clients' Risk - Checklist

1. Clients' Factors

- Entity risks, duration/length of relationship, Negative Media Reputation Risks, Industry Risks, Profession/Activity Risks

2. Products & Services Factors

- Line of business risks and utilisation of increased risk products and services

3. Channels Factors

- Account origination and servicing solicited/unsolicited; face-to-face or non-face-to-face

4. Country Factors

- Increased risk countries and in country hotspots and regional hotspots

5. Transactions Factors

- Unusual and/or suspicious transactions alerts, investigations and SAR filings

go much further. These restrictions can stem from legal or regulatory drivers or be as a result of a reputational risk assessment of the risks posed in a particular case.

For more details see Part 1, Section 2, Sub-section 2, Customer Risks; Sub-section 3, Products and Services Risks (including Channels Risks) and Sub-section 4, Country Risks above, as well as Risk Assessment above in Risk Assessment, Part 1, Section 4.

D. Monitoring and Controls

A firm must implement controls that are designed to manage the risks that it faces. A compliance programme can benefit from a written monitoring and control plan that identifies what should be monitored and controlled, when and by whom. Firms generally apply three lines of defence in AML Compliance. The first line of defence is with the front office, for example in relation to day to day client onboarding and ongoing monitoring. It is essential that the front office understand their responsibilities, rather than seeing AML as 'just a compliance issue'. The second line of defence is with the Compliance or AML function that may control or sample check for example, client KYC files, transaction due diligence files, payment review decisions, screening of records, etc. Such functions may also undertake the monitoring described in an annual monitoring and control plan which seeks to report back on the most significant risk areas. Regular monitoring across different risk areas can provide indication of systemic weakness in controls as well as be used for predicting horizon risks. Reports should be communicated to management who should be in a position to reprioritise strategy and resources as required. This process involves continuous review and improvement, as indeed do all parts of a risk based AML Programme. The third line of defence is played by internal audit who evaluate the risks and controls and inform senior management reporting to the Board of Directors Audit Committee. In many countries, external auditors may also play an important role in evaluating Banks' internal controls and procedures.

Ensuring client due diligence is correct and appropriate is an important control. The client risk category assigned to a client will determine the frequency of monitoring the client is subjected to. For example, a higher risk client will face more regular reviews of its client due diligence information and would also be subject to enhanced monitoring of transaction activity, which can be based on either or both of frequency of monitoring or transactional volume. At each review, a firm has an opportunity and a duty to ensure KYC information is up to date. Doing this also allows screening of the KYC information against sanctions lists, for example. The higher the risk rating for a client, the more monitor-

ing and controls they are subjected to. This ensures the firm continues to meet legal and regulatory obligations, and to protect its reputation, whilst at the same time ensuring it is easier for lower risk clients in terms of the conditions associated with managing their relationship. Sampling of client files or transactional activity is commonly used as way of indicating whether controls for onboarding clients are operating appropriately.

Tools used to conduct controls should be periodically tested, including transaction filters and their data feeds. Sometimes this testing requires IT expertise, and sometimes testing can be conducted by Compliance, via sampling.

Controls and monitoring can be ‘prevention’ based or ‘detection’ based. Preventative controls aimed at putting a stop to risks from manifesting are usually hardwired into systems used to manage risk, for example, not allowing approval of a gift without Compliance providing consent. In this example, detective controls would aim to identify those instances where such approval was not provided. The combination of both of these types of controls would be targeted at each risk identified, with risks considered to be greater receiving the most resources to mitigate them.

Controls need to be continually assessed for effectiveness. An undetected control failure can result in breach of law or regulation, not to mention the subsequent reputational impact in the event of public enforcement action. No good programme remains static. Industry standards change, as do regulator expectations.

E. MIS/Reporting

Various controls in place at a firm can be configured to generate metrics. Metrics can be used by an AML professional to monitor the ways in which its client profiles or business focus is changing, as well as to highlight areas where there may be control weaknesses. Such metrics should be made available to senior management, with issue action tracking used to close any outstanding issues as well as regular reporting on the status and effectiveness of the overall programme.

F. Record Keeping

A firm should have clear record keeping policies regarding its AML programme as well as evidence around clients and transactions. As far as clients and transactions are concerned a firm must maintain records for at least five years after accounts are closed or transactions undertaken. Firms should also be prepared to provide programme information to their regulators and, on occasion, to local law enforcement. Decisions made must be recorded and those records must be kept in line with

firm policy and legal obligation. AML professionals in particular must be in a position to justify the actions they took in any given scenario, with that decision having followed prescribed procedure. The importance of keeping client-related documentation safe and retrievable is also clear, with firms having been subject to enforcement action for not doing so. A firm’s systems and controls should be interwoven with the concepts of record keeping and retrieval. Keeping client due diligence information up to date is also an ideal way of remaining well placed to meet legal and regulatory requirements. A search for a particular client that has been requested by a regulator, for example, could result in a client being missed if the information held on them is out of date or has been recorded incorrectly. Maintaining accurate records also allows firms to target business opportunities more effectively if they know their clients well.

2. Designated Compliance Officer

In most jurisdictions it is a requirement that a firm designate an individual or individuals to oversee the AML programme, including the firm’s CIP operating separately from the front office functions. This person may be the compliance officer that is responsible for other compliance areas of the firm or a dedicated AML officer, who in either case should have AML related expertise and have the ability to explain risks to senior management, the front office, IT and operations personnel.

A firm must provide its compliance officer with sufficient authority and resources to effectively implement the firm’s AML programme. Among other duties with respect to the firm’s CIP and suspicious activity reporting, this person should:

- a) receive reports of suspicious activity from firm personnel;
- b) gather all relevant business information to evaluate and investigate suspicious activity; and
- c) determine whether the activity warrants reporting to senior management, and/or to the appropriate authorities.

The person responsible for overseeing the AML procedures should not be the same employee responsible for the functional areas where money laundering activity may occur.

While the AML officer directs the AML programme, the programme should make clear that compliance is the responsibility of all employees. The “front office” of any business should be primarily responsible for the business it brings into a company, and is often in the best position to collect the client information needed to satisfy KYC and due diligence requirements and to

determine whether transactions are legitimate. It is vital that the function has a relationship with external bodies and other competitors to benchmark and leverage from industry best practice.

These relationships could include:

- a) Law enforcement agencies
- b) Government agencies
- c) Trade & industry bodies
- d) Peer firms/competitors

3. Training Programme

Another important component of an AML Programme is the requirement to provide ongoing education and training for all relevant personnel. This training programme should be conducted at least at regular intervals and include training on the firm’s policies and procedures and the relevant laws and regulations. Staff in different roles will have differing training needs and a firm must identify what these needs are and target staff with appropriate training in order to carry out their duties in accordance with policy, law and regulation. This can mean that the majority of staff receive a training module which is generic, while staff with greater exposure to financial crime receiving an enhanced module, maybe with a test. Staff can be split into a number of different categories, receive training by different means (for example, computer-based or face-to-face etc.) and also receive training at differing frequencies depending on the risks they face. Local language requirements should be considered to ensure the audience understands the key messages and requirements.

Effective training modules should also include the use of case studies, highlighting red flags, as well as past enforcement cases. Apart from this being a way to show an individual undertaking the training how detecting financial crime applies to them, it is a great way of avoiding the monotony of imparting the obligations placed on staff.

Training must receive the support of senior management at a firm. The ‘tone from the top’ should emphasise how important training is to a firm and mandate its completion. The consequences of non-completion should also be made clear.

It is one thing to provide training and another to ensure that training is effective. A training module can be accompanied by a test that must be passed with an escalation procedure for those unable to pass after a few attempts. The training material must also be reviewed regularly to ensure it continues to reflect risks as they stand and the direction of the business.

Whichever approach is taken by a firm, it must be able to defend its position. Additionally, training is one part of staff education. A firm should also maintain staff awareness of the risks they face and their responsibilities. This can be via a number of means, for example, poster campaigns, regular compliance releases detailing changes to risks or interesting cases, etc.

Firms should maintain records to evidence the training provided to and received by staff.

4. Independent Testing

Independent testing of the adequacy of AML compliance programmes is essential. Firms should conduct regular independent testing. A firm may carry out independent testing through its own personnel (such as an internal audit staff) or others who do not perform or oversee AML functions. In either circumstance, the audit function should test all affected areas to ensure that personnel understand and are complying with the AML policies and procedures and that these policies and procedures are adequate. The results of any audit should be documented and reported to the firm’s senior management or an internal audit committee or department, and follow up should be done to ensure that any deficiencies in the firm’s anti-money laundering programme are addressed and corrected. External auditors may also be appointed in certain circumstances to evaluate a firm’s AML programme, however, they would normally seek to review any internal audits undertaken as part of their review.

Sanctions Programme

Sanctions are any measure or restriction taken by one or more countries (or their respective government agencies) or international organisations which are aimed at restricting dealings of any kind with or involving another country, specific persons, legal entities, organisations or goods (sanctioned parties). Whilst sanctions have been in place for a number of years, it was not until 9/11 that sanctions regimes were brought to the forefront of firms' attention. Funds are needed to commit any terrorist act and the US Government in particular sought to ensure that US firms or US persons were not permitted to engage in any kind of business activity with or provide any goods or services to sanctioned parties. Other developed countries also increased the requirements of their sanctions programmes after this event. With increased legislation and regulation, firms had to develop sanctions compliance programmes.

There are some issues of global concern that are addressed by sanctions - human rights, genocide, and weapons proliferation, preservation of the integrity of the financial system, corruption and global terrorist financing. Sanctions could, however, be a means by which governments can extend their foreign policy agenda. Whatever the reasons, increasing enforcement action by authorities has meant firms have had to make significant enhancements to their sanctions programmes. As breaching sanctions is usually a strict liability offence, there is an increased focus on a firm having adequate systems and controls to guard against breaches. Stiff penalties, both in terms of monetary fines and imprisonment can befall any individual or entity that has breached sanctions.

Restrictions imposed could include travel bans, trade and arms embargoes, asset freezes, etc. All of these types of measures are aimed at restricting the extent to which the financial services industry is able to provide products or services to individuals and entities thought to be supporting regimes or undertaking activities which are not considered acceptable.

Sanctions Programme - Core Elements	
1	policies, procedures and controls
2	designated compliance officer
3	training programme for employees
4	independent audit function to test the programme
Source: Author	

Whilst compliance with sanctions is absolute, firms are permitted to take a risk based approach to compliance. In doing so, a firm must be prepared to defend its approach. A firm's approach should include the following core elements.

1. Policies, Procedures and Controls

As with an AML programme, a firm must decide its own interpretation of legal, regulatory and reputational risk and arrive at a policy stance. It has been argued that for sanctions and AML that firms have a corporate social responsibility in terms of preventing breaches of law and regulation. As such, firms should consider a policy statement in complying with sanctions from specified sources as part of its code of conduct in addition to developing a robust sanctions policy.

A. Sanctions Compliance Policy

The first step in constructing the sanctions policy is to define what those restrictions are meant to accomplish. Businesses must comply with the laws of jurisdictions where they do business. Most are concerned about protecting their reputation. Many are concerned with acting responsibly on key issues. There might not be global consensus on what it means to "do the right thing" regarding sanctions compliance, as one country's embargo might not be embraced by another.

The types or risks which should be addressed in sanctions policies include:

- a) Applicability of sanctions lists
- b) Sanctioned countries/governments/regimes
- c) Screening of new and existing clients
- d) Screening of transactions
- e) Prohibited transactions
- f) Pre-approvals and escalation of issues
- g) Freezing/blocking of assets and reporting

Global companies often incorporate into their policies measures imposed by the UN, EU and US to stay on the right side of major issues. One reason for including the US restrictions globally is the list of large penalties described in Part 2, Section 8, Enforcement Cases. Several non-US financial institutions have tried to steer clear of US sanctions laws and failed because they did not employ a global approach. US jurisdiction can be triggered by the involvement of a US person anywhere in the world, involvement of a US system or platform, or involvement of a non-US person who has caused US persons to violate US sanctions law. It might not be easy for every company to administer a procedure for employees who are "US persons" to recuse themselves from activity involving sanctioned countries, particularly if those employees are senior executives in control of busi-

ness lines and operations with a global reach.

In designing a sanctions policy, it is also best to think ahead. Effective sanctions programmes should be forward thinking to anticipate sudden sanctions events that could prove disruptive and costly if businesses are caught unaware. A forward-looking list of sanctions restrictions can be created to enable escalations to subject matter experts. That list may proactively exceed strict legal requirements to avoid accidental contact with a sanctioned entity's behaviour.

A firm's sanctions policies and procedures should also require risk based screening of transactions against sanctions lists – particularly those sanctions lists applicable in the countries where it does business and relevant to the firm's sanctions policy. Financial transactions sanctions screening normally occurs in "real time" or as the transactions occur. Identifying a sanctioned transaction after it is processed is too late in that it fails to prevent funds from reaching or otherwise benefitting sanctioned parties. Real time review of sanctions hits can be more resource intensive than the historical monitoring of transactions for suspicious activity. Financial institutions generally automate electronic funds transfer screening and employ smart filters able to detect sanctioned country locations and name variations. Regulators of financial institutions generally require written procedures for the handling of payment filter "hits".

B. Detection and SAR Filing

In the event that employees identify activity which may be in breach of sanctions, either manually or by using an automated system, they must escalate in accordance with policy. Such escalations are usually to Compliance who will undertake an investigation and decide the necessary action. Internally, appropriate action could range from conducting enhanced monitoring on an account or client to the extreme of terminating a client relationship. Externally, it could mean making a report to a regulator where it is believed that a sanctions requirement has been breached or if there is a specific requirement that a payment should be blocked or rejected. Additionally, in the course of the investigation, Compliance officers should also consider whether any activity identified should also be the subject of a SAR. Whilst not all SARs are likely to have elements related to sanctions, sanction investigations should be considered for suspicious activity.

C. Risk Assessment

As with AML risk assessments, it is practical to assign an initial inherent risk rating, consider mitigating controls, and then assign a residual risk rating. The fact that sanctions risk is not synonymous with AML risk makes it

difficult to apply the AML methodology to a sanctions risk assessment. An AML risk assessment might use a quantitative approach, such as assigning risk numbers to client types and weighing them against dollar volumes, but this might not be as useful for sanctions.

Another approach to sanctions risk is to identify ways the company's activities could result in a benefit to a sanctioned party. Does a business make available anything of value – including services, merchandise, payments, loans or credit to persons other than vetted clients? The following under D. Monitoring and controls below include a number of increased risks of products, services, customer types related to the financial industry that may potentially be considered as part of a Sanctions Risk Assesment. For more specific details see Risk Assessment above.

Major Sanctions Risks	
i)	International fund transfers
ii)	Correspondent banking
iii)	International commercial shipping lines or freight forwarders operating via transit routes known for drugs, arms or sanctioned parties
iv)	Energy and commodities companies operating in sanctioned regions
v)	Money service business
vi)	Charities

However, no single group of industries are categorically high risk for sanctions. Countries require all nationals to comply with sanctions restrictions. Therefore, a violation can occur in just about any industry. Moreover, while some sanctioned countries derive revenues from a particular sector - energy, for example - not all energy companies deal with sanctioned parties.

D. Monitoring and Controls

Weaknesses in a firm's sanctions compliance programme are usually identified either in relation to the screening of payments or a firm's client base for sanctioned parties. Most firms make use of an external data provider for up to date sanctions lists to ensure it continues to be in compliance with legal requirements. The controls that are put in place will depend largely on the size, business nature, structure and geographical footprint of the organisation. The controls that are in place must be risk based and targeted. Some of the high risk areas identified above have been selected to illustrate this:

(i) International fund transfers

Sanctions regimes will contain restrictions on payments

to sanctioned individuals, entities and regimes and also in relation to certain types of goods, for example, arms, US origin goods to specified countries, etc. The international transfer of funds has been a key way for those trying to evade sanctions to send their money internationally without being detected and stopped.

Sanctioned parties excluded from international commerce will of course turn to agents and front companies to access financial systems without detection. Therefore, it is imperative that a company knows its customers, partners and counterparties or other third parties who act on a firm's behalf, and that they are all screened against relevant sanctions lists. Additionally, a firm providing electronic funds transfers to its clients must ensure that they comply with international standards for those transfers, for example, ensuring that payments are not processed without suitable and accurate remitter and beneficiary information, or that payments are flagged if they are potential breaches of sanctions requirements. The importance of ongoing due diligence and reviews is imperative here.

(ii) Correspondent Banking

Whilst correspondent banking is a key way of providing access to a certain jurisdiction's financial system without being present in that jurisdiction, there are many risks associated with this activity. Providing such services allows the movement of funds which may be subject to abuse and as such increased controls are required in this area. Those controls start right from the onboarding stage. As previously discussed, if correspondent banking clients are from a jurisdiction that is known to carry higher AML, sanctions or bribery and corruption risks then firms must ensure they have collected enough due diligence to become comfortable with the relationship. This includes understanding the correspondent banking client's customer base. Certain customers will be of especially high risk and these must be identified. For a firm providing correspondent banking services to a client, it is often interpreted to be a sign of that firm vouching for their client. Correspondent banking relationships can be identified from payment messages and firms should consider the reputational risk associated with a client prior to offering them this service. Commensurate monitoring of their activities must take place. Such monitoring can be based on a transaction volumes but should be enhanced with a focus on things like patterns of payments, recipients, currencies, jurisdictions, etc.

Those wishing to evade sanctions can create fictitious front companies to undertake transactions and there must be controls in place which seek to identify such companies. Monitoring suspicious activity is a key way of doing this. When it is identified, the suspicious activ-

ity should be investigated and reported where necessary. Transaction information should be analysed to ensure that there are no sanctions concerns about any payments that are processed and that firms are not being used as a conduit to divert funds to sanctioned individuals, entities and regimes.

Staff need to be made aware of the types of activity that could indicate attempts to evade sanctions and understand that additional due diligence may be appropriate before processing payments.

(iii) International commercial shipping lines or freight forwarders operating via transit routes known for drugs, arms or sanctioned parties

The shipping industry carries a risk of contravening international sanctions primarily due to the ways in which it is possible for entities to disguise/conceal the identities of vessel owners, goods carried and origin/destination of goods. Firms will usually class the shipping industry as one of the higher risk industries simply because of this and must, therefore, perform due diligence to know with whom they are contracting. Failure to conduct appropriate due diligence on shippers and freight forwarders as well as all of the parties that may be involved in a trade finance transaction could be subject to sanctions violations for having facilitated activities that contravene sanctions laws.

There are a number of ways in which sanctions risks could arise: a ship could be controlled by ownership or charter agreement to provide services to a sanctioned party; or the use of a ship, controlled by ownership or charter agreement, to provide shipping services for the purpose of supplying goods to be used in contravention of sanctions regulations.

At the client onboarding stage and as part of a regular review, a firm must ensure it has systems and controls in place to identify the involvement of sanctioned parties, including understanding the intended business. If it is known that a particular commodity or shipping route will be used, for example, and that route has increased sanctions risks then this will help a firm determine what if any legal and/or reputational risks exist to permit the establishment of the relationship or transaction.

When first engaging in business, a firm may choose to include certain representations and warranties in contracts to secure some protection. However, representations and warranties in a contract should never be a substitute for due diligence including how a shipping line ensures it complies with international sanctions, how it screens vessels, or how it ensures goods are not being transported via sanctioned regions etc. Whilst the

shipping industry in certain regions may be reluctant to undertake these types of controls, firms should nevertheless insist that such controls are present before they conduct business with such shippers.

Depending on the nature of a firm's business activity, if they are involved in providing trade finance support to their clients, there is an expectation that as part of carrying out a transaction or deal they are inspecting documents such as letters of credit, bills of lading, etc. These documents may assist a firm in identifying any potential sanctions risks that may exist.

(iv) Energy and Commodities companies operating in sanctioned regions

A number of well known and large energy companies operate in or around sanctioned regions as do commodities companies. Some of these companies carry licenses which have been granted by government authorities and others are usually careful to ensure they do not breach international sanctions by restricting the type of business they undertake. Some sanctions regimes are very specific to certain types of energy from certain jurisdictions, for example petroleum based products from Iran.

When such companies approach a firm for business, the firm should ensure it understands fully the nature of that customer's business. Enhanced due diligence at the start should allow the early identification of issues and as stated above, can impact the extent and scope of sanctions representations and warranties and other controls that could be appropriate. A firm should monitor the transactions and behaviour of entities like those involved in the energy and commodity sector given the higher risk these entities represent including requiring more detail about the extent of the business, and more frequent site visits, for example, to conduct risk assessments. Thus, a firm's approach should be to ensure the risks in onboarding a customer are sufficiently addressed and that a periodic review is conducted to ensure that the risks have not changed.

(v) Money Service Businesses

Firms offering products or services to Money Service Businesses (MSBs) should be aware of the inherent money laundering risks associated with such activity. The fact that it is possible to conceal the identity of underlying remitters or receivers of payments is one of the reasons why this is a high risk industry for both AML and sanctions. A firm offering products or services to a MSB should be aware of how and from where the MSB generates its revenues. Even an indirect connection to sanctioned parties can create legal exposure. The revenues derived from a sanctioned region might be a small percentage of a company's overall revenue, but may pro-

duce a clear benefit for sanctioned parties. A UK-based, regulated MSB will carry different risks to one located in the Middle East, for example, and therefore, require different due diligence and ongoing monitoring of the account activity.

As mentioned at the beginning of this chapter, sanctions restrictions could be aimed at particular regimes. It is thought that economic sanctions, that is depriving the regime from access to the financial markets, can be used to persuade the regime to amend its ways. In reality, amending its ways is the last resort for such regimes. Instead, rogue regimes will usually concoct ways to evade sanctions, such as creating fictitious companies and complex structures aimed to conceal the identity of the true beneficial owner(s). Such regimes can then use these fictitious companies to send money through MSBs. Given the significant risks posed by MSBs and the types of business they conduct, some firms may decide that appropriately that MSBs are too risky to have as a client and prohibit the establishment of MSB relationships altogether. Where a firm decides to establish such relationships, it should do so only after conducting appropriate due diligence, obtaining senior management approval and subjecting the MSB to regular and robust monitoring to ensure transactions are analysed for suspicious activity and that the risks have not changed.

(vi) Charities

Whilst charitable giving is to be fully supported, terrorist groups have benefitted and so care needs to be taken with respect to charity customers particularly ones operating in or around sanctioned countries.

E. MIS/Reporting

Firms should operate a robust reporting framework as part of their sanctions programme, which allows senior management to be made aware of how well the controls in the programme are working. Reporting on how sanctions alerts are being cleared by a dedicated team, the number of payments/messages that are screened and released, the number of customers that are screened, as well as the number of payment messages or clients that are reported to authorities are some of the ways in which a programme's effectiveness can be assessed through reporting. Such reports will also provide a view as to how sanctions risks are changing, that is increasing, stable, or decreasing. Regular reporting can also help to determine if policies need to be changed or supplemented.

Firms with an international presence may also seek to monitor whether certain international offices are undertaking business with certain regions or industries that are known to be at higher risk of sanctions risks or

violations. Capturing this kind of data allows a firm to take a wholesale view as to whether sanctions risks are being assessed consistently across the firm. Sanctions restrictions are constantly changing. Therefore, it is important that a firm keep abreast of new sanctions regulations and key enforcement actions and assess whether its internal processes and controls are sufficient to demonstrate it has in place a robust sanctions compliance programme.

F. Record Keeping

Whilst keeping records is a legal requirement, it is also an expectation of regulators and government agencies. The plethora of enforcement actions involving sanctions violations committed by a firm over a period of time reminds us that maintaining transaction details including details regarding sanctions risk reviews is a critical part of protecting a firm in the event of a sanctions issue. Indeed, documenting the rationale for processing or rejecting a payment, engaging in a transaction or onboarding a client where sanctions risks are identified could mean the difference between a sanctions fine and no action taken by a regulator or government agency. Firms should ensure there is periodic communication and training regarding the importance of documenting and recording the actions taken or decisions made about a client or a transaction particularly when such action involves a potential sanctions issue.

2. Designated Compliance Officer

A sanctions compliance programme requires a dedicated officer operating separately from the front office functions. The officer should oversee guidance, training, controls, and monitoring of those controls. The sanctions officer should have sanctions-related expertise and the ability to explain risks to senior management, the front office, IT and operations personnel, as well as externally to regulators and law enforcement. Whilst the sanctions officer directs the sanctions programme, it should be communicated that an effective sanctions compliance programme is the responsibility of all employees. The “front office” of any business, which is primarily responsible for the business it brings into a company, and is often in the best position to collect the client information, details about a client’s business and the purpose of the relationship which is needed to satisfy KYC and due diligence requirements. It is also important that operations personnel to understand how sanctions requirements might affect the transactions systems and flows they manage. Thus, these groups will require guidance from compliance regarding sanctions risks that may arise in processing transactions or managing systems.

3. Training Programme

Developing and providing targeted training to staff based on their roles and responsibilities is essential to ensure employees are equipped to address and manage sanctions risk. Once training needs have been identified and material developed, training should be conducted on a regular basis. For those roles that carry a higher risk of exposure to sanctions, ordinarily firms should ensure that sanctions training be accompanied by a test to demonstrate understanding and knowledge gained from such training. This should also include sanctions awareness communications when important regulatory or legal changes occur. Finally, the frequency of training will differ according to the sanctions exposure faced by a particular group. Identifying training needs on an annual basis will help to demonstrate that a firm understands and communicates emerging risks and implements the appropriate controls to mitigate that risk.

4. Independent Testing

All aspects of a sanctions programme should be subject to independent testing. Whether internally or externally driven, such tests should aim to provide some assurance that processes and controls are operating effectively to mitigate the likelihood of violating sanctions laws. Compliance departments’ own testing should also be verified independently. This includes at the minimum testing the effectiveness of, reporting, training, payments processing and client and deal due diligence. The frequency of testing should be determined using a risk based approach. Whilst not all aspects of a programme need to be tested at the same time, all aspects should be subject to testing on a periodic basis. Choosing which aspects to test may be driven by whether any MIS reporting has highlighted any breaches or trends, or, for example, whether there has been an increase of accounts opened in a higher risk jurisdiction. Whichever area is targeted the rationale for the decision should be recorded

Anti Bribery & Corruption Programme

Whilst third party corruption, i.e. bank customers, is covered by a financial institutions AML Programme, the financial institution must also seek to prevent its own employees from any involvement in bribery or corruption both on the supply side or on the demand side. An effective Anti Bribery & Corruption (ABC) Programme is essential, both to protect the firm from any involvement in bribery or corruption and as a defence in case any individual cases or allegations arise.

There has been a lot of commentary over the last few years, particularly from Bank regulators, law enforcement agencies, international bodies and NGOs as to what constitutes an effective ABC Programme with various papers and guidance being issued.

Of course as with any other type of compliance programme, the type of programme implemented to prevent bribery and corruption will depend on the size, business nature and structure of the organisation. It should also include the following core elements but tailored towards ABC:

ABC Programme - Core Elements	
1	Policies, procedures and controls
2	Designated compliance officer
3	Training programme for employees
4	Independent audit function to test the programme

Source: Author

1. Policies, Procedures & Controls;

The starting point for any financial institution is to adopt a policy statement that clearly outlines the firm’s policy against bribery and corruption.

A. Code of Conduct / Specific Policies

Whilst a firm wide Policy should spell out in detail the firm’s approach, the headline approach should be included succinctly in a firm’s overall Code of Conduct, where an unequivocal zero tolerance stance against bribery and corruption by the firm’s employees and those acting on the firm’s behalf should be made clear.

Beyond this clear articulation of a firm’s overall position, a group wide high level Policy will include greater detail but specific Policies will also need to be issued, with supporting procedures and controls. These areas for

specific attention should be formulated and updated following the completion of an appropriate risk assessment exercise.

B. Detection and SAR Filing

In the event that suspicions arise of employee behaviour which indicates the giving or receiving of a bribe or other form of corruption, the event should be treated very much in the same way as a third party case and considered for SAR filing and other possible notifications (or ‘self disclosure’) to the authorities as well as pursuing the investigation internally, which will be normal in the circumstances.

C. Risk Assessment

As with AML risk assessments, it may make sense to assign an initial inherent risk rating, consider mitigating controls and then assign a residual risk rating. As with sanctions risk, ABC risk is however not synonymous with AML risk and so it is difficult to apply the AML methodology to an ABC risk assessment. A firm should therefore identify where specific ABC risks may occur within the organisation. It is likely that in most firms the following areas will require consideration and may be considered as having increased risks:

Major ABC Risks	
i)	Dealing with public officials and particularly ones who would also qualify as PEPs
ii)	Dealing with persons from jurisdictions or in industries with inherent elevated risks of corruption
iii)	Gifts, hospitality, entertainment and travel
iv)	Political contributions
v)	Charitable donations and sponsorships
vi)	Facilitation payments (which many firms will want to prohibit)
vii)	Books and records
viii)	Solicitations
ix)	Offers of employment, internships and the like
x)	Deals with third parties, agents and intermediaries

D. Monitoring & Controls

ABC controls largely rely on staff escalating issues when they should and in a timely manner. Whilst there can be automated systems in place, staff will still need to know how to identify bribery or corruption using these systems.

(i) Public Officials

In managing the risks associated with a public official, such a term first needs a clear definition articulated within the ABC Policy. Unlike for PEPs where the definition is enshrined within legislation, for public officials, industry guidance can be relied upon but is quite broad. Government entities are usually regarded as public officials and by implication, employees of that government entity would also be considered to be a public official when acting in their professional capacity. In the identification of these public officials, firms should also have the ability to confirm whether or not they qualify as PEPs. Whilst an individual may be a public official without being a PEP, a PEP will always be a public official.

The risks associated with a public official are that they are, by virtue of their position within a jurisdiction's government/government entity, political party or judicial body, susceptible to the receipt of bribes. Firms should ensure that there is a process for identifying the presence of a public official in any business dealings and that any transfer of any kind of value is subject to pre-approval, normally by Compliance. So, ordinarily the giving or receiving of gifts, entertainment, etc. in relation to public officials will be monitored for any breaches of policy.

(ii) Dealing with persons from jurisdictions or in industries with inherent elevated risks of corruption

A firm's approach to managing AML will have increased monitoring and controls in place in general for higher risk clients. Beneficial owners, industries and jurisdictions will all form a part of the risk considerations to determine which risk category a client will belong to. In accordance with a firm's country risk model, jurisdictions are risk rated and one of the factors taken into account is bribery and corruption risk. The susceptibility of individuals, including public officials, to bribes and corruption may be higher in some jurisdictions than others. A firm's country risk model may place reliance on Transparency International's Corruption Perceptions Index, for example, which will assist in identifying jurisdictions where there is an increased risk of bribery or corruption.

Certain industries also carry a higher risk of bribery and corruption. Examples include extractive industries, defence and aerospace industries. If a client relationship involves a high risk industry then the overall controls applied to that relationship will increase. More in-depth checks when the client's due diligence information is reviewed will seek to continue to identify the involvement of any individuals, entities or industries which present a higher bribery and corruption risk and monitor such involvement on an ongoing basis.

(iii) Gifts, hospitality, entertainment and travel

One of the key ways of trying to disguise the giving/receipt of bribes is to pass them off as a gift, hospitality, entertainment or travel. Whilst these can form part of the normal course of business, a firm must have controls in place to ensure that the transfer of any value is above board. A client relationship manager may choose to provide a potential or actual client with some form of inducement to engage in business or a client themselves may provide such an inducement to secure favourable business terms. A firm needs to have registers in place which record precise details about any gifts, entertainment, hospitality or travel. These registers should then be sample checked on a risk based approach to ensure that the transfer of any value is conducted in accordance with policy. Guidance should be provided to all staff to ensure there are no ambiguities in their responsibilities.

(iv) Political contributions;

All political regimes need to raise funds in some manner. Corrupt regimes may choose to directly request or strongly intimate that a political contribution is required in order to secure favourable business terms. There should be a mechanism in place for recording all donations of this kind with sample based checking to ensure the donations had the appropriate pre-approvals.

(v) Charitable donations and sponsorships;

In a similar way, clients involved in charities may infer or request a donation or sponsorship of an event in order to secure business. Charities are also at a higher risk of corruption and money laundering and so increased vigilance is especially required. Pre-approval processes, together with regular checks to ensure processes are being followed will allow better management of the risk of bribery or corruption.

(vi) Facilitation payments

Facilitation payments (also known as "grease payments") are small payments made to secure or expedite the performance of routine or necessary action to which the payer is legally or otherwise entitled. Many firms will want a complete prohibition on all facilitation payments in order to comply with bribery and corruption laws. However, in some jurisdictions or regions, these types of payment are commonly accepted as part of the fabric of commerce. A firm could use the kinds of registers mentioned above to spot facilitation payments, though this can be challenging and relies on staff to correctly identify and report any direct or indirect requests for such payments. Where facilitation payments are prohibited, staff need to be made aware of this, especially in those regions where they are commonplace, as well as how to report such instances.

(vii) Books and records

The system of internal controls must be designed to ensure reasonably fair and accurate books, records and accounts. The test should be based on reasonableness, not materiality or a minimum dollar threshold. Maintaining accurate books and records is not limited to the function of a finance department or limited to financial and accounting documentation or processes. Virtually all forms of documentation created by the business fall in scope and so all employees play a role in ensuring compliance with this requirement.

The control environment, the accounting system and control procedures are therefore all key components.

(viii) Solicitations

An entity or its staff must not solicit the payment of a bribe and should report any instance or attempt by any client or potential client to solicit such a payment. Firms will rely on these matters being escalated to management, including via the whistleblowing process. Via the various registers mentioned above, it may be possible to identify payments or transfers in value which are unusual. A solicitation may be at the heart of this activity.

(ix) Offers of employment, internships

Transfer of value has been mentioned above. Aside from the monetary value associated with an offer of employment, such offers including for example internships, may be considered to be offered by firms as bribes in order to secure a client relationship or favourable business terms. As part of the onboarding processes for staff, Human Resources (HR) departments have established procedures for offers of employment, including to interns and such procedures should incorporate appropriate due diligence checks, for example screening against sanctions lists, identification of public officials, PEPs etc. These checks should enable a firm to identify whether the recruitment process was conducted in a fair and transparent manner as well as allowing them to raise any issues relating to staff prior to employment. Cases could arise where a 'connected' candidate is selected for a particular role rather than the best candidate. Additionally, if any offer is made at the request of, or connected to a public official with whom a firm is dealing with in order to obtain or retain business, there must be appropriate pre-approval. HR or the business should raise issues initially with pre-approval raised to the relevant compliance department. The effectiveness of and adherence to the pre-approval process should be regularly checked.

(x) Dealings with third parties, agents and intermediaries

The programme needs to consider risks associated with third parties who are paid a fee to act on the company's behalf. Examples of third parties include agents and other intermediaries, consultants, representatives, distributors, contractors and suppliers, consortia, and joint venture partners. Processes around the engagement and ongoing monitoring of third parties should be well established, with appropriate senior management oversight for higher risk engagements. A company may find it beneficial to risk rate all of its third party dealings, in order to adopt a proportionate and risk based approach. Internal processes should at least include: (a) properly documented risk based due diligence before engaging higher risk third parties; (b) informing such third parties of the organisation's commitment to complying with anti bribery laws; (c) ensuring third parties sign a legal contract which contains appropriate anti bribery and corruption clauses and termination rights; and (d) monitoring periodically, on a risk based approach, those third parties who pose higher risk receiving more frequent and in depth checking and monitoring.

E. MIS/Reporting

An effective ABC Programme will include regular reports to senior management. Senior management needs to know how well an ABC Programme is protecting the firm from breaching laws or regulation or subjecting the firm to unacceptable levels of financial or reputational risks. Each firm will configure such reports to illustrate how well controls are operating to mitigate the risks that have been identified. The monitoring and controls mentioned above should be included within such reporting. If any trends or gaps are identified, these should be used to direct the compliance programme.

Across the industry, reporting relating to ABC within firms is not as well established as say, for AML or sanctions, and different firms will be at different levels of experience in managing ABC risks. A firm may experience challenges in obtaining data from areas such as finance or HR where those areas have not previously been required to monitor their operations for bribery or corruption, seeking to adapt existing systems for purposes for which they may never have been originally intended. Continued open dialogue with these areas and compliance support will be required to ensure that any required system or procedural changes are implemented. Having the 'tone from the top' is essential here to release budgets required to make such enhancements.

F. Record keeping

Accurate Books and Records & Internal Controls are an essential part of an ABC Programme. Slush funds,

misclassification of expenses, false invoices, dual general ledger accounts and misuse of petty cash are all ways employees can arrange bribe payments. Effective internal controls and accurate record keeping is an essential component of a compliance programme to detect and prevent bribery.

2. Designated Compliance Officer

Especially in the larger firms, in order to manage an effective ABC Programme there should be a specific individual with overall responsibility. The designated officer should have the appropriate level of expertise, authority and support in order to successfully run the programme and will be responsible for designing strategy, identifying, managing and reporting risks and having suitable controls to manage risks which are regularly tested. They will make available clear policies and guidelines and ensure appropriate escalation processes are in place.

3. Training Programme

In some cases, it may also be appropriate to extend the training to external parties such as suppliers or third party agents who are deemed particularly high risk.

4. Independent Testing

As well as relevant departments undertaking testing of the effectiveness of their monitoring and control tasks, this should also be tested independently. A compliance department may rely on a local assertion that controls are operating effectively but should verify this assertion by completing its own testing. For example, an HR department may state that its controls for identifying Public Officials when onboarding new staff and for existing staff are operating effectively. Or a finance department may assert that controls to identify unusual payments to third parties are working effectively. Compliance should verify these assertions independently. Internal audit functions will also undertake testing of the effectiveness of controls and will take into account local testing as well as compliance testing that has taken place.

The frequency of testing should be risk-based, can vary and can also be dependent on whether there is a known control weakness. The results of all testing should be raised to the appropriate fora for review.

Anti-Fraud Programme

A proficient anti-fraud programme ensures the risks from fraud to an organisation are minimised to the extent that the business can operate without unnecessary constraints. A culture with a zero tolerance approach to fraud when combined with a strong code of business ethics is engendered by senior management. Unlike AML, Sanctions and Bribery and Corruption, losses incurred due to fraud are immediately felt on profit and loss accounts. It is much easier to quantify and forecast fraud loss than for the other areas. A firm's approach to fraud risk management should be risk based and targeted, with the following elements tailored towards fraud detection and prevention:

Anti-Fraud Programme - Core Elements	
1	Policies, procedures and controls
2	Designated compliance officer
3	Training programme for employees
4	Independent audit function to test the programme

Source: Author

An Anti-Fraud Programme should operate around a set of high level principles, including:

- a) documenting and distributing a fraud control strategy that is an inherent part of the organisation's governance structure; this should include the expectations upon board directors, senior management and all employees to manage fraud risks.
- b) implementing a written fraud policy which outlines the actions for employees to take when fraud is suspected and that outlines the organisation's approach to fraud investigation to ensure consistency of approach.
- c) fraud risk assessment framework as part of an annual monitoring programme. This should identify the potential fraud risks arising from the products and services of the organisation.
- d) establishing and applying prevention techniques to avoid potential key fraud risk events and mitigate possible impact on the organisation.
- e) establishing detection techniques to uncover fraud events when preventive measures fail or unmitigated risks are realized.
- f) implementing a reporting or whistleblowing process to encourage employees to report suspicions of potential fraud.

1. Policies, Procedures & Controls

A. Code of Conduct/Specific Policies

Firms must convey a clear stance against fraud, usually in its code of conduct that it will not tolerate staff fraud or client fraud. As part of a firm's fraud risk management strategy, there should be a written policy, available to all employees which explains the expectations of the firm's board of directors and senior management to the issue of fraud.

Additionally as part of the fraud risk governance, a firm should include written policies and procedures to manage fraud risks. These procedures may include (but not limited to):

- a) whistleblowing and suspicion reporting for internal incident management
- b) information barrier policies
- c) bribery & corruption position statements
- d) segregation of internal controls and processes
- e) fraud awareness training
- f) fraud risk assessments
- g) continuous monitoring or surveillance
- h) systems access protocols

Firms will usually have a regular fraud risk management committee that meets to discuss the direction and effectiveness of its Anti-Fraud Programme.

Firms should also consider the ways in which it can reduce the incentives to committing or becoming involved in fraudulent activity. There should be increased emphasis on disincentives being built into performance management and remuneration policies. The threat of disciplinary or legal action can also act as a disincentive. However, as there will always be a risk of fraudulent activity occurring, a firm will place greater reliance on the strengths of its systems and controls in place to prevent and detect fraudulent activity.

B. Detection and SAR Filing

All instances and attempts of fraud should be investigated thoroughly and in a timely manner. Such activity should be considered for external reporting, whether to regulators, law enforcement or financial intelligence units.

A firm must put in place an investigation process to ensure that when fraud is suspected and reported it will be investigated in accordance with relevant rules of evidence, chains of custody and subsequently considered for reporting requirements (board, legal, regulatory or disciplinary). The investigation protocols should ensure that appropriate teams are alerted and

involved if necessary. Dependent upon the severity of the allegation, the investigating officer may need to involve HR, legal or compliance unit and/or the management committee or board. The protocols will, to some extent, be dictated by the local approach and lines of responsibility, for example, a specific anti-fraud function or embedded within a local risk unit or within the legal or compliance function. Ideally, investigations should be graded according to financial or other relevant thresholds or anticipated regulatory or reputational outcomes. This may depend on the volume and type of fraud exposure within an organisation and will assist in conveying the severity of the investigation to senior management.

Behavioural Red Flags

Most occupational fraudsters' crimes are motivated at least in part by some kind of financial or other pressure. In addition, while committing a fraud, an individual may frequently display certain behavioural traits associated with stress or the fear of being caught. These behavioural red flags can often be a warning sign that fraud is occurring. According to the Association of Certified Fraud Examiners 2012, Report to the Nations, a list of 16 common red flags were identified. The four most frequently cited in order were the following: The fraudster living beyond his or her means (36%), experiencing financial difficulties (27%), having an unusually close association with vendors or customers (19%), and displaying excessive control issues (18%). Then followed in order the following: Divorce/ Family problems, wheeler dealer attitude/ Irritability, Suspiciousness or Defensiveness, Addiction problems, Past employment related problems, Complained about inadequate pay, Refusal to take vacations, Excessive pressure from within organisations, past legal problems, Complained about lack of Authority, Excessive family/peer pressure for success and Instability in Life Circumstances.

C. Risk Assessment

As with AML risk assessments inherent risk ratings and net or residual risk ratings are often used to measure known risks. For fraud, the first step is identifying fraud risk that a firm is exposed to and then assessing the extent of that exposure, focussing of course on the major fraud notes as fraud can literally exist almost anywhere.

Across firms, the following areas should be considered as presenting increased fraud risks:

- i) Segregation of duties
- ii) Internal fraud: employee theft, fraud and unauthorised trading
- iii) External fraud or theft

- iv) IT governance
- v) Procurement
- vi) HR
- vii) Finance: inappropriately reporting and concealing assets or information
- viii) Whistleblowing

D. Monitoring and controls

Suitable monitoring and controls need to be in place both to prevent and detect instances of fraud. Controls will never eliminate the risk of fraud completely. Therefore, a firm should implement flexible techniques to deal with the frauds that have occurred. Weak controls in this area will increase opportunities for fraud to occur. In order to undertake any fraud, there must be an element of corruption and the controls required to prevent and detect corruption will overlap with fraud controls to a large extent. Below are some examples of the controls one would expect within an Anti-Fraud Programme:

(i) Segregation of duties

One of the ways in which frauds can occur within a firm is where individuals who are able to enter payment data also have approval rights for that payment. So in preventing fraud, adequate procedures and system access restrictions need to be in place which guard against the likelihood that someone committing fraud would be able to cover their tracks. Approval of invoices, payments etc. should be independently conducted to provide comfort that they are being made in the correct and legal manner. There are many further areas where segregation is appropriate and risk should be accordingly assessed.

(ii) Internal fraud

There are a number of ways in which employee theft, fraud and unauthorised trading can be prevented. It relies upon the necessary controls being in place, being undertaken systematically and their effectiveness being regularly tested. Examples include system restrictions which do not allow certain staff to divert client funds into personal accounts, profit and loss reports for desks to monitor for any trading anomalies, or approval controls in place for travel expenses, amongst others. Firms should also consider monitoring staff who do not observe block leave or appear to be working excessive hours.

(iii) External fraud or theft

Preventing external fraud is a huge challenge due to the dynamic nature of the threat. In one aspect understanding the nature of the threat clearly helps to focus preventative and detective control efforts. Typically a fraudster is targeting either access to

confidential data or seeking ways of getting funds paid away from an account. In the case of the latter, what typically proceeds a fraudulent payment attempt is an attempt to access client data and potentially even change certain elements of static data (phone records or address details) in order to re-route potential callbacks and divert mail away from a genuine client, thereby potentially widening the window in which fraud can be committed undetected. Key to preventing such events is strong, dynamic authentication controls both at the payment of payment execution requests and changes to client static data. Knowing your client is the key weapon in detecting unusual account changes or transactional requests. However, as technology is enabling a myriad of new ways to make payments, the nature of the fraud modus operandi evolves too. Fighting fraud is never a static business, it's more akin to an arms race with both sides constantly "tooling up" to outsmart the other!

Theft usually represents itself in a more physical way, such as a cash counter or ATM robbery. However, here the gains are limited, so again the nature of the threat has evolved into stealing client data, access codes and intellectual property electronically. Combating cyber threats requires a sophisticated approach to controlling data and securing it in a resilient IT environment.

(iv) IT governance

All IT landscapes will have known vulnerability points. Assessing these and actively managing them to resolution is key to ensuring the opportunity for a fraudster to exploit a weakness is minimised. A common feature of rogue trading events within investment banking is the exploitation of systems when back office personnel move to a front office role. Their ability to circumvent system protocols, often enabled through not having old access rights to back office systems rescinded can be a key enabler of not only the fraud being committed, but also going undetected for lengthy period of time. As per all fraud threats, IT threats are dynamic and evolving in line with technology and business strategy. Investment banks' activity in high frequency trading is another great example of a new scenario in which fraud or a malicious act can be committed en masse. In this instance, proper IT governance needs to ensure that malicious or manipulative coding or algorithms cannot be entered into a system, with a fail-safe (kill switch) facility enabled "just in case" anything slips through in order that future "flash crash" disasters can be avoided. IT governance basics, such as logical access controls to systems, controlling of peoples access rights and then monitoring for potentially toxic access combinations are all great ways to prevent unwanted events.

(v) Procurement

Contracts should be awarded fairly, relationships with suppliers should be managed with clarity and transparency and payments for goods or services should be made in accordance with contract terms. Along this journey, there are many opportunities for fraud to occur. There needs to be a clear process when selecting vendors and there should be appropriate approval (for example, authorised signatories) in place, particularly for the larger contracts, to ensure the risk of impropriety is minimised. Staff managing these relationships should be made aware of the possibility that they may be asked to take bribes to secure selection or negotiate favourable terms. Standard term contracts should be used, with any variations being approved by management.

Committees are likely to be in place that require a robust justification for selection of a supplier. Throughout the relationship, suppliers may submit false invoices or staff may create false invoices from suppliers in order to obtain and divert ill-gotten gains. Finance departments will often be required and best placed to undertake analysis of invoices received and amounts paid to ensure they reconcile. Relationships need to be monitored on a periodic basis, and this should take place independently. A review which is not independent increases the risk that those perpetrating a fraud may be able to conceal their objective, method and gains/losses.

There is also a natural link here to bribery and corruption: suppliers may try to bestow lavish gifts or entertainment to those staff at a firm who are considered to be influential in securing favourable contract terms and/or are signing engagement contracts. Hence, transparent processes in procurement and in recording and independent analysis of gifts and entertainment (given and received) ensures bribery and corruption risks are minimised.

The provision of company credit cards should require an approval process to ensure visibility of who is given a card. Company credit card spending should also be closely reviewed to ensure appropriate items are being procured or purchased from appropriate sources and that they are in line with what one might ordinarily expect for that individual's role at a firm. Most firms will require credit card expenditure to be reconciled monthly by card holders.

(vi) Human Resources

Whilst fraud risks exist with HR, such as payroll fraud, these tend to be comparatively modest ticket value frauds. Where HR's role is more crucial is ensuring

they execute their duty as a gatekeeper and supervisor in the fight against insider fraud. The insider threat is highly varied – fraud occurs at every level from junior administrative staff to directors and chief executives. Top performers and long-serving senior directors are liable to slip through the net, at least until they make a major mistake. Finance departments are unlikely to question the expenses of a director who has been with the company for a long period and delivered good results – or the behavior of a trader who delivers numbers greatly in excess of the market norm. Often, fraudulent employees may appear to be the most diligent in the department.

Ideally, these individuals need to be excluded from the company before they wreak untold damage, in monetary and reputational terms, by a recruitment process that is as alert to fraud risk as it is to job competence. This puts HR into the front line. They create the initial application form, vet it for inconsistencies, downright lies and unexplained gaps and then interview the candidate.

(vii) Finance

Financial statement fraud schemes tend to be classified as ones in which an employee intentionally causes a misstatement or omission of material information in the organisation's financial reports (e.g., recording fictitious revenues, understating reported expenses or artificially inflating reported assets). The role of the finance team in preventing and detecting such events focusses heavily on reconciliation and verification protocols. For example, balance sheet verification, books and records reconciliations (including suspense and non-personal accounts) and validating manual adjustments and changes to static data records are all key areas which have typically been exploited. Alternatively, one could summarise the key control in one word; skepticism. Skepticism involves the validation of information through probing questions, the critical assessment of evidence, and attention to inconsistencies. Skepticism increases not only the likelihood that fraud will be detected, but also the perception that fraud will be detected, which reduces the risk that fraud will be attempted.

In 2002, WorldCom, under Bernie Ebbets one the world's largest telecommunications companies (at its peak worth US\$160bio) filed for bankruptcy following an US\$11bio accounting fraud. WorldCom made major accounting misstatements that hid the increasingly perilous financial condition of the company. As enormous as the fraud was, it was accomplished in a relatively mundane way, with more than US\$11bio in false or unsupported accounting entries were made

in WorldCom's financial systems in order to achieve desired reported financial results. Whilst WorldCom was the largest accounting scandal at the time, it had many predecessors and would be succeeded soon after by the like of Enron led by Ken Lay. For more details see Part 1, Section 1, Fraud and Part 2, Section 7, Criminals & Terrorists.

(viii) Whistleblowing

Whistleblowing is still the singular most effective means of detecting unwanted behavior. A well communicated policy, supported by proper training and awareness amongst employees is key to achieving good results. The Policy should protect staff from any adverse consequences or retribution where a disclosure is made in good faith, even if it turns out that there was no substance to the concern. The presence or absence of a reporting hotline has an interesting impact on how frauds are discovered. According to the ACFE's 2012 Report to the Nations, organisations with some form of hotline in place saw a much higher likelihood that a fraud would be detected by a tip (51%) than organisations without such a hotline (35%). An interesting trend is the financial rewarding of whistleblowers, introduced in the US in 2011 through the Dodd Frank Act. This offers monetary awards to eligible individuals who voluntarily provide original information that leads to successful commission enforcement actions resulting in the imposition of monetary sanctions over US\$1,000,000, and certain related successful actions. Awards are required to be made in the amount of 10% to 30% of the monetary sanctions collected, with the largest award made to date totaling US\$14mio. Since the introduction of this act, the volume of reported whistleblowing cases continues to climb, with 3,001 whistleblower reports received in 2012. The most common complaint categories reported by whistleblowers were Corporate Disclosures and Financials (18.2%), Offering Fraud (15.5%), and Manipulation (15.2%).

E. MIS/Reporting

The provision of management information is essential to any anti-fraud programme. Incidents of fraud should be reported. As fraud loss is quantifiable, it is easier than with AML, bribery or corruption or sanctions to identify pattern changes which could indicate fraud has taken place. Such reports must be reviewed carefully and escalated to senior management, including the Board where necessary. Profit and loss, supplier payment and travel expense are all examples of reports that could be used to identify fraudulent activity. The simple question of whether something is 'too good to be true' can be ignored at a firm's peril. Such challenge should be ingrained in all staff charged with analysing fraud

metrics. Senior management should also be made aware of legal and regulatory developments in the area as this may affect a firm's risk appetite for certain products or services that start to carry a higher fraud risk. Firms will always need to take a risk based approach to fraud mitigation and a firm's risk appetite for fraud loss can be defined in monetary terms. It is also easier with fraud to calculate and predict savings made as a result of the anti-fraud programme. For example, if a fraud loss had occurred due to an exploited IT deficiency which is then mitigated, the saving is at least that initial fraud loss. Firms may incorporate fraud case management systems to generate fraud related data but this is certainly more complex to implement and keep accurate in larger firms. Reporting of fraud trends and incidents will also help other parts of a firm ensure that they have systems and controls in place to prevent future occurrences. As part of this strengthening of an Anti-Fraud Programme, firms should also make use of the plethora of industry guidance and updates on fraud trends available.

F. Record Keeping

Not only will accurate record keeping assist a firm in the event of any legal or regulatory investigation but it will also help a firm undertake its own investigation into fraudulent activity. Whether it is keeping a record of how a beauty parade of suppliers led to a recommendation to pick a certain supplier or it is a keeping a record of incidents of fraud so as to undertake trend analysis, records need to be kept accurately and be retrievable. Inventories of fraud incidents must be kept in order to assist reporting and as a way of learning from past control weaknesses. Throughout a client relationship or the general operation of a firm, without appropriate record keeping, a firm will be less equipped to spot and manage fraud risks and fraudulent activity.

2. Designated Officer

A designated officer may be appointed to take charge of a firm's Anti-Fraud Programme, usually run from an operational risk environment, but with close collaboration with compliance where required. Such an officer will set the fraud strategy, have it endorsed by senior management/the board, organise a team to undertake specific parts of the programme and will also be expected to have visibility of all incidents of fraud or attempted fraud and fraud trends, as well as face off to external stakeholders, such as regulators and law enforcement.

3. Training Programme

Firms may either include fraud as a topic within general financial crime training or have a specific training module on fraud or a number of modules. In any case they must take a risk based approach to training and

maintaining awareness. When joining a firm, staff are usually a required to sign a firm's Code of Conduct, in which a firm will set out that it does not tolerate any fraud by any member of staff and the consequences for staff involved in fraudulent activity, both at and outside the firm. In any training on fraud, staff should be made of aware of a firm's stance on fraud, how to spot it, how to report it and the consequences of not conforming to the firm's policy on fraud. Departments or staff at a higher risk of fraud, e.g. payments, procurement, etc. should be identified and receive additional training which seeks to use case studies to illustrate the ways in which their roles could be susceptible to fraudulent activity and the red flags they should look out for when trying to identify fraudulent activity. Indeed, the learning points from any incidents or attempts of fraud should be used to direct the future of an anti-fraud programme. Fraud awareness programmes can also be used to good effect, especially in the higher risk departments, e.g. newsletters, poster campaigns, stationary with anti-fraud messages and reminders, etc.

4. Independent Testing

Within a firm there should be differing roles and responsibilities, for example:

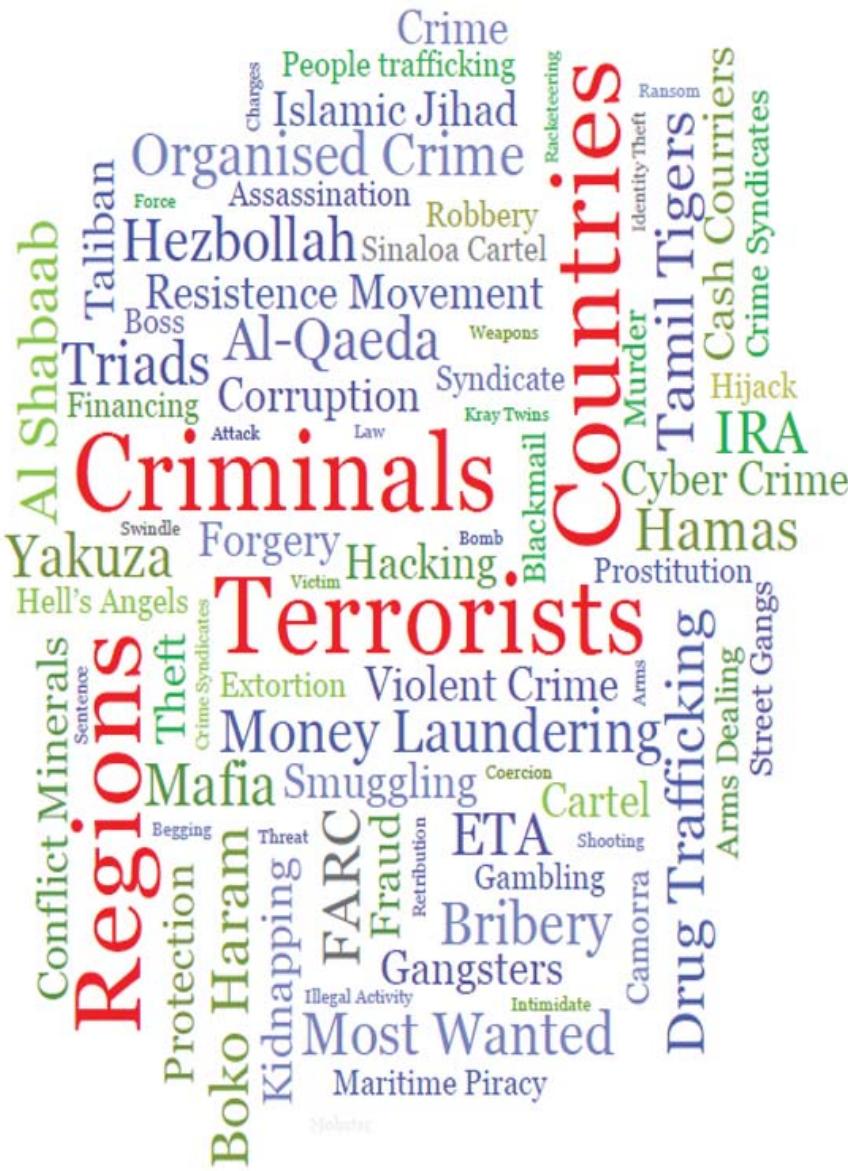

- a) oversight of fraud controls and risks
- b) design and implementation of fraud strategy
- c) independent audit and investigation functions
- d) monitoring and surveillance of internal processes and controls

A firm may designate such responsibilities to the board of directors, or the internal audit committee, a risk management function or at the micro level to all staff as part of their overall vigilance to identify and prevent fraud and manage fraud risk within their specific roles. It could be operational risk areas or compliance at a firm that undertakes fraud testing. As well as self-assessment, the Anti-Fraud Programme should be tested independently. Some firms will have a separate risk assessment and review department that will do this, whilst others will rely solely on internal audit to validate the effectiveness of the programme. Following a fraud incident, firms may well be expected to appoint external auditors to review its Anti-Fraud Programme. This may provide comfort to a regulator that fraud standards are improved but should not be relied upon as a one-off exercise. Continued learning is required from any review to ensure standards are maintained. The principles of good fraud management should be continually reviewed to ensure they remain appropriate for a firm.

Introduction

Across the world, in all habitable continents, money laundering risks present themselves, through in particular, organised criminal gangs or terrorist groups and whilst each may have distinctive hallmarks, they often share similar motives and characteristics too. Organised Criminal gangs can be found in most countries in the world with the most successful exploiting key points of interest along the value chain of the most profitable criminal industries whether drugs, people or products in origin transit and destination countries. Concentrations do appear in many of the Worlds largest and most successful Countries and Cities, where trade, demand and opportunities abound, but many like Terrorist Groups can also be found in most regions of the world though increasingly they tend to flourish where they can find either a safe haven or where there is sufficient instability or where strong government control is missing.

Criminals and terrorist have something unique in common, they refuse to play by the rules societies have laid down, they prosper and exploit weak and unstable situations and they manipulate situations for their personal goals. Where both seek to concentrate power and authority, to control their direct and surrounding environments, ostensibly in the case of organised crime for financial reward and in the case of terrorists for political ideals, leading to political revolution, each will fail unless they reform, each have a fundamental deficit and lack any true legitimisation. As they grow, they will bribe for protection, apply violence to achieve their aims, generate funds from propaganda and/or from profitable criminal activities, propagate their ideologies and care less about the consequences of their actions. As they create their mayhem, they rely on the rest of us to be intimidated, to feel helpless and overawed.

History shows that whilst new threats emerge, quietly at first, they begin to be understood and eventually are despatched. A gangland murder or a terrorist attack creates both media attention, but also equally, perhaps as a result requires a political response. The greater the crime the greater the response. The shorter the conflict the greater the intensity. The longer the conflict, the wiser the belligerents.

Whether the threat from terrorists versus that posed by organised crime is greater is arguable, certainly the terrorist impact from attacks is undeniable, and certainly the misery created to many from organised crime is real.

Whilst it was considered that there was a distinct separation between the two, these distinctions can become blurred and it should be assumed that both learn from each other, and both need to be aggressively resisted. After bin Laden was killed in 2011 in Pakistan, the head of an organised criminal gang became the most wanted man in the world, at least according to US authorities. Joaquin Guzman Loera (El Chapo)¹ is the leader of the

Mexican Sinaloa Cartel, that controls a significant part of the drug trade into the USA also earning the title as "the world's most powerful drug trafficker." Whilst the Sinaloa Cartel jealously and violently defends its interests it both competes and works with other organised gangs both in Mexico and around the world. The existence of organised criminal gangs on every continent in virtually every country remains a significant threat to society, as does the existence of terrorist groups.

There are no government published lists covering the Worlds organised criminal gangs, nor do governments publish and/or rank organised criminal gangs where membership size, success in generating proceeds, harms caused etc are collected and made available, though there are private publications relating to one or more gangs and a number of authors that have tried to collect information on some of the most important. For terrorist groups, they exploit weaknesses in society and in governments, promoting extreme ideology and combining this with the capacity and willingness to employ violence as a principal tactical tool. Whilst there are numerous lists issued by countries, the names of groups are varied with only a few that consistently include the same groups, with a global consensus surrounding Al-Qaeda and Al-Qaeda affiliates but not too many more. For more information about Organised Crime and Terrorists, in particular, Terrorist Financiers see Part 1, Section 1. For more details about many of the worst terrorist attacks see Part 2, Section 6.

In this Part 2 Section 5, the material is split into Regions, and then sub Regions with particular focus on Countries of particular interest from a money laundering, organised crime and terrorism perspective, and includes the most powerful criminal gangs and the most dangerous terrorist groups operating still today and some of histories most notorious, are briefly profiled, with 20 of the most significant profiled in more detail. These criminal gangs and terrorist groups are also placed into the country and regions from where they have their origins or most significant operations.

As far as Regions and Countries are concerned there is an increased focus on Africa; the Middle East; Latin America; Eastern Europe and Asia, whilst at the same time also including Western Europe and North America also. More detailed country profiles include the BRIC countries, the CIVETS and the so called Next 11, namely, Brazil, Russia, India and China (BRIC) and Colombia, Indonesia, Vietnam, Egypt, Turkey and South Africa (CIVETS) and Bangladesh, Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, Philippines, Turkey, South Korea, and (as with the CIVETS list) Vietnam (Next 11). Country Focus is also increased for Countries that are home or materially affected by Organised crime groups or terrorist organisations and are subject to sanctions and embargoes as well as countries identified by FATF as having Strategic AML deficiencies or where counter measures are required.

In this Part 2, Section 5 Regions, Countries, Criminals and Terrorists, the sources are all publicly available and in particular the following key sources have been used.

- Wikipedia - www.Wikipedia.com; Country Profiles and money laundering and financial crime information from the The US Central Intelligence Agency (CIA) World Factbook 2013-14. <https://www.cia.gov/library/publications/the-world-factbook/index.html> and from the 2013 International Narcotics Control Strategy Report (INCSR), which is an annual report by the Department of State to Congress prepared in accordance with the Foreign Assistance Act. It describes the efforts of countries to attack all aspects of the international drug trade, money laundering and financial crimes.

- Wikipedia - http://en.m.wikipedia.org/wiki/List_of_designated_terrorist_organisations; which is a list of designated terrorist organisations by the UN, EU, and by certain national governments, including the US Canada, Australia, UK, France, India Turkey. National resources are also utilised including for example the US Department of the Treasury's, Office of Foreign Assets Control (OFAC) for details see: <http://www.treasury.gov/about/organisational-structure/offices/Pages/Office-of-Foreign-Assets-Control.aspx>. Many organisations that are accused of being a terrorist organisation deny using the terrorism label;

- from the National Consortium for the Study of Terrorism and Responses to Terrorism, better known as START, a university-based research center, based at the University of Maryland, and a Center of Excellence of the U.S. Department of Homeland Security, focussing on terrorism in the US and around the world. START's materials include profiles for many of the most important past and present terrorist groups and details of over 100,000 terrorist incidents. START can be found at <http://www.start.umd.edu>.

- from the South Asia Terrorism Portal, (SATP), which is the largest resource of publicly available information on terrorism, low intensity warfare and ethnic/communal/sectarian strife in South Asia, in particular on the Indian sub continent region, covering the profiling of terrorist and extremist groups and incidents. The SATP is run by The Institute for Conflict Management, an Indian non-Profit Society set up in 1997 in New Delhi. The SATP can be found at: <http://www.satp.org>.

- from the Terrorism Research & Analysis Consortium (TRAC), which gathers comprehensive terrorist information about groups and incidents in cooperation with a team of 2800 experts. TRAC can be found at <http://www.trackingterrorism.org/about>

- and from the International Centre for Political Violence and Terrorism Research (ICPVTR) which is a specialist centre within the S. Rajaratnam School of International Studies (RSIS) at Nanyang Technological University, Singapore, which conducts research on politically motivated violence and at mitigating its effects on the international system. The ICPVTR can be found at: <http://www.pvtv.org>

UN Designated Terrorist Organisations

The Al-Qaeda Sanctions Committee was established on 15 October 1999 by the Security Council with the adoption of resolution 1267 for the purpose of overseeing the implementation of sanctions measures imposed on Taliban-controlled Afghanistan for its support of bin Laden. The sanctions regime has been modified and strengthened by subsequent resolutions, so that the sanctions measures now apply to designated individuals and entities associated with Al-Qaeda wherever located. On 17 June 2011, the Security Council decided to split the Al-Qaeda and Taliban sanctions regime. Resolution 1989 (2011) stipulates that the sanctions list maintained by the Security Council Committee established pursuant to resolution 1267 (1999) will henceforth be known as the "Al-Qaeda Sanctions List" and include only names of those individuals, groups, undertakings and entities associated with Al-Qaeda. The applicable resolutions requires all States to: freeze the assets of, prevent the entry into or transit through their territories by, and prevent the direct or indirect supply, sale and transfer of arms and military equipment to any individual or entity associated with Al-Qaeda as designated by the Committee. The primary responsibility for the implementation of the sanctions measures rests with Member States and effective implementation is mandatory.

The following entities are on the Al-Qaeda Sanctions List:² Abu Sayyaf Group; Egyptian Islamic Jihad; Al-Qaeda; Al Rashid Trust; Armed Islamic Group; Asbat Al-Ansar; Harakat Ul-Mujahideen / HUM; Islamic Army of Aden; Islamic Movement Of Uzbekistan; Libyan Islamic Fighting Group; Makhtab al-Khidamat; The Organisation of Al-Qaeda in the Islamic Maghreb; Wafa Humanitarian Organisation; Jaish-i-Mohammed; Jam'ah Tâ'awun Al-Islamia; Rabita Trust; Ummah Tameer E-Nau (UTN); Afghan Support Committee (ASC); Revival of Islamic Heritage Society; Al-Haramain Islamic Foundation (various branches and offices); Eastern Turkistan Islamic Movement; Moroccan Islamic Combatant Group; Tunisian Combatant Group; Global Relief Foundation (GRF); Jemah Islamiyah; Benevolence International Foundation; Lashkar i Jhangvi (LJ); Ansar al-Islam; Islamic International Brigade (IIB); Riyadus-Salikin Reconnaissance and Sabotage Battalion of Chechen Martyrs (RSRSBCM); Special Purpose Islamic Regiment (SPIR); Djamar Houmat Daawa Salafia (DHDS); Al-Haramain Foundation (Indonesia); Al Furqan; Taibah International-Bosnia Offices; Al-Qaeda in Iraq; Lashkar-E-Tayyiba; Islamic Jihad Group; Al-Akhtar Trust International; Sanabel Relief Agency Limited; International Islamic Relief Organisation, (Philippines and Indonesia, Branch Offices); Rajah Solaiman Movement; Al-Qaeda in the Arabian Peninsula; Harakat-ul Jihad Islami; Emarat Kavkaz; Tehrik-e-Taliban Pakistan (TTP); Jemmad Anshorut Tauhid; Movement for Unity and Jihad in West Africa (MU-JAO); Ansar Eddine.

Africa

Africa is the world's second-largest and second-most populous continent, covering 6% of the Earth's total surface area and 20.4% of the total land area, home to approximately 1.0 billion people (as of 2009). Africa has 54 fully recognised sovereign states, 9 territories and three de

facto states with limited recognition. These States have borders which were largely drawn during the 19th Century when European Imperial powers engaged in a territorial scramble, occupying almost all of the continent apart from only 2 independent States, Ethiopia, known as "Abyssinia" and Liberia. Imperial rule largely continued until after the end of the Second World War, where colonial territories gradually obtained formal independence, for example, the first being Libya (1951); Tunisia and Morocco (1956); and Ghana (1957), with the rest following later.

Africa, particularly central Eastern Africa, is widely accepted as the origin of humans, with the earliest Homo sapiens (modern human) found in Ethiopia being dated to around 200,000 years ago.

Africa straddles the equator and encompasses numerous climate areas; it is the only continent to stretch from the northern temperate to southern temperate zones. It is thought that Africa most likely got its name, from the word "Afri" used to refer to the Carthaginians, descendants of the Phoenicia who lived in North Africa in modern-day Tunisia who were referred to as "Afri" meaning "dust" or "afar".

Under Roman rule, Carthage became the capital of Africa Province, which also included the coastal part of modern Libya. The Latin suffix "-ica" can sometimes be used to denote a land. The later Muslim kingdom of Ifriqiya, modern-day Tunisia, also preserved a form of the name. According to the ancient Romans, Africa lay to the west of Egypt, while "Asia" was used to refer to Anatolia and lands to the east. A definite line was drawn between the two continents by the geographer Ptolemy (85–165 AD), indicating Alexandria along the Prime Meridian and making the isthmus of Suez and the Red Sea the boundary between Asia and Africa.

An alternative possible source comes from the Berber peoples of North Africa where the word "ifri" meaning "cave" was a reference to this tribe as cave dwellers.

Africa can be divided up into numerous regions, from a simple divide of North Africa or the Maghreb made up largely of Arabs and considered part of the Arab World

and Sub Saharan Africa, or the rest of Africa, once called Black Africa, to the south. The Sahel is the transitional zone between the Sahara and the tropical savanna further South.

In North Africa there are only 6 Countries included, being Algeria, Morocco, Western Sahara, Tunisia, Libya and Mauritania. In Sub- Saharan Africa there are 49 countries, the largest of which by population are Nigeria, Ethiopia, Democratic Republic of Congo, South Africa, Tanzania and Kenya.

The World Bank works with 45 Countries, as many are considered less developed compared to other countries and regions of the world, with many of these countries having weak public institutions, high levels of corruption and poor records on human rights. Many who live in Sub Saharan Africa live under desperate conditions, with natural disasters and civil wars aggravating the situation, and with close to 10 million internally displaced with approximately the same ending up in other countries as refugees. The largest refugee camp in the world, is in Africa, in Dadaab in Kenya, close to the border with Somalia with over 500'000 inhabitants.

Valuable economic sectors include oil, mining or tourism, but these are only available to a few and many of the rest still rely on agriculture, which for many remains at the level of subsistence farming.

Under such circumstances a number of serious criminal activities have flourished. These include, Drug Trafficking, Smuggling, Human Trafficking and Terrorism. For example as far as Drug Trafficking is concerned, according to the UN Office on Drugs and Crime (UNODC) 27 % of Europe's cocaine enters through West Africa. Ghana, Sierra Leone, Mali and Nigeria are the most common entry points for Cocaine from Colombia. From there the drugs are transported up North through the Sahara.

Corruption remains a significant problem in Africa with 9 out of the 20 worst ranked countries by Transparency International in its 2012 Corruptions Perception Index with Angola, DR Congo, Libya, Equatorial Guinea, Zimbabwe, Burundi, Chad, Sudan and Somalia all included.

Not surprisingly, trafficking of human beings is considered as one of the fastest growing sectors of criminal activity in the region, exploiting the dire situation of many. Finally, terrorist activities and related weapons dealers are present in many countries.

Sub-Saharan Africa can also be divided into regions, with Countries falling into one or more of the following regional groupings, West Africa, the Horn of Africa, Eastern Africa, Central Africa and Southern Africa.

North Africa

Often described as the Maghreb which is defined as the region west of Egypt, being the region including the Atlas Mountains and the coastal plains of Morocco, Algeria, Tunisia, and Libya, and since the 1989 formation of the Arab Maghreb Union, by the inclusion of a fifth nation,

Mauritania, and of the disputed territory of Western Sahara (mostly controlled by Morocco). Maghrebis were once known as "Moors". Partially isolated from the rest of the continent by the Atlas Mountains and the Sahara desert, inhabitants of the northern parts of the Maghreb have long had commercial and cultural ties to the inhabitants of the Mediterranean countries of Southern Europe and Western Asia, going back at least to the Phoenicians in the 1st millennium BC (the Phoenician colony of Carthage having been founded, according to tradition, in what is now Tunisia circa 800 BC).

Algeria

After more than a century of rule by France, Algerian achieved its independence in 1962. Whilst the National Liberation Front (FLN), had largely dominated politics since independence, elections in 1991 led to success in the first round by the Islamic Salvation Front (FIS). The army began a crackdown on the FIS which escalated into an insurgency, which saw intense violence from 1992-98, resulted in over 100,000 deaths, many attributed to indiscriminate massacres of villagers by extremists. The Armed Islamic Group (GIA) emerged in 1992 as a splinter group of the FIS. The government however gained the upper hand by the late-1990s, and Abdelaziz Bouteflika won the presidency in 1999 in an election widely viewed as fraudulent and has retained the Presidency to this day. After the millennium, an amnesty offered to GIA members, with those continuing the struggle considered to have joined the Salafist Group for Preaching and Combat (GSPC) who in 2006 merged with Al-Qaeda to form Al-Qaeda in the Islamic Maghreb, which has launched an ongoing series of kidnappings and bombings targeting the Algerian Government and Western interests. The government in 2011 introduced some political reforms in response to the Arab Spring, including lifting the 19-year-old state of emergency restrictions.

Armed Islamic Group - Algeria

The Armed Islamic Group (GIA) emerged in 1992 as a splinter group of the Islamic Salvation Front (FIS), a body campaigning to establish an Islamic state in

Algeria. When this campaign appeared to be nearing success in Algeria, and an FIS electoral victory seemed imminent, the ruling military government cancelled forthcoming elections and installed exiled independence fighter Mohammed Boudiaf as the new president. This violation caused outrage and led to the establishment of the Armed Islamic Group. The US Department of State speculated that the GIA possessed "several hundred to several thousand" members. Other sources, including military personnel in Algeria, estimated that GIA operated with 1,300 -2,000 men supported by a network of 5,000-6,000 members. The organisation's funding was, for the most part, derived from criminal activity including extortion and bank raids. In terms of ideology the GIA adhered to the Salafist tradition; a distinct subdivision within the Islamic faith that believes in only the revelations of Mohammed and his companions. GIA considered itself to be engaged in a war against all infidels; a category GIA defined as encompassing non-Muslims and non-Salafist Muslims. Targets of GIA operations have included the Algerian government and its supporters, foreign governments believed to support the Algerian ruling party, and even singers of Rai music; an amalgamation of French, Spanish and Arabic musical traditions that has been deemed religiously offensive by GIA. Civilians have also become victims of GIA attacks, with journalists, intellectuals and those attending secular schools proving to be high risk social groups. Between 1993 and 1998 GIA claimed the lives of around 70,000 people, including more than 100 foreign nationals.

A characteristic form of violence perpetrated by GIA was to raid villages at night and slit the throats of their victims. GIA has also engaged in fighting with the FIS and rival armed Islamic group the Islamic Salvation Army (AIS). The AIS disputed GIA's claim to the just jihad in Algeria, asserting that its own campaign, which focussed primarily on combating government forces, was the rightful cause as it did not target civilians. GIA operations were also launched outside Algeria, focusing in particular on targets in France. For instance on 24 December 1994 GIA operatives hijacked an Air France plane scheduled to make a flight from Algiers to Paris. While the attempt was thwarted by French security forces who boarded the plane, the purported aim of the operation was to fly the aircraft into the Eiffel Tower. Another plot to execute a terrorist attack abroad was foiled in 1999 when GIA member Ahmed Ressam was apprehended attempting to cross the US-Canadian border in a car laden with explosives. The intended target of the attack was Los Angeles International Airport, where Ressam and his co-conspirators had planned to detonate the bombs on the eve of the millennium. After pardons were offered by the Algerian government to any GIA militants who surrendered and had not participated in civilian attacks, some sources have come to believe that the organisation has become inactive as a terrorist group. Members persisting in terrorist activities are thought to have been absorbed by the Salafist Group for Call and Combat (GSPC).

Western Sahara

Western Sahara is a disputed territory on the northwest coast of Africa bordered by Morocco, Mauritania, and Algeria. After Spain withdrew from its former colony of Spanish Sahara in 1976, Morocco annexed the northern two-thirds of Western Sahara and claimed the rest of the territory in 1979, following Mauritania's withdrawal. A guerrilla war with the Polisario Front contesting Morocco's sovereignty ended in a 1991 cease-fire and the establishment of a UN peacekeeping operation. As part of this effort, the UN sought to offer a choice to the peoples of the Western Sahara between independence (favored by the Polisario Front) or integration into Morocco. A proposed referendum never took place due to lack of agreement on voter eligibility. The 2,700 kms (1,700 miles) long defensive sand berm, built by the Moroccans from 1980 to 1987 and running the length of the territory, continues to separate the opposing forces with Morocco controlling the roughly 80% of the territory west of the berm. Ethnic tensions in Western Sahara occasionally erupt into violence requiring a Moroccan security force response.

Mauritania

Mauritania achieved its independence from France in 1960. Maouya Ould Sid'Ahmed Taya seized power in a coup in 1984 and ruled Mauritania autocratically for more than two decades. A bloodless coup in August 2005 deposed President Taya and ushered in military rule, which continues though Taya has been replaced and the current President Aziz. Mauritania has a largely informal and under-developed economy, a large informal trade sector, porous borders, and corruption in government and the private sector. Only an estimated 4% of Mauritanian adults have bank accounts, and informal banking and financial systems remain vulnerable to exploitation. In recent years, Mauritania has become a transshipment point for cocaine from South America intended for the European market. General smuggling, trafficking in vehicles stolen mostly in Europe, parallel financial networks, and the provision of logistical support for organised international drug traffickers are all serious problems. Because of increasing terrorist and illicit trafficking activities along the long and porous borders with Algeria and Mali, the Government of Mauritania has continued an aggressive campaign against corruption and the terrorist network of Al-Qaeda in the Islamic Maghreb.

Libya

The Italians supplanted the Ottoman Turks in the area around Tripoli in 1911 and did not relinquish their hold until 1943 when defeated in World War II. Libya then passed to UN administration and achieved inde-

pendence in 1951. Following a 1969 military coup, Col Muammar al-Gaddafi assumed leadership and began to espouse his political system at home, which was a combination of socialism and Islam. During the 1970s, Gaddafi used oil revenues to promote his ideology outside Libya, supporting subversive and terrorist activities that included the downing of two airliners, one over Scotland, another in Northern Africa, and a discotheque bombing in Berlin. UN sanctions in 1992 isolated Gaddafi politically and economically following the attacks. After 9/11 he agreed to end Libya's programme to develop weapons of mass destruction, and made significant strides in normalising relations with Western nations, including acceptance of responsibility for the terrorist bombings and to pay compensation. UN sanctions were lifted in 2003 as a result. Following the start of the Arab Spring, unrest erupted in Libya in early 2011. Gaddafi's brutal crackdown on protesters spawned a civil war that triggered UN authorisation of air and naval intervention by the international community. After months of fighting between government and opposition forces, including by the Libyan Islamic Movement for Change a successor Organisation to the Libyan Islamic Fighting Group, the Gaddafi regime was toppled in mid-2011 and replaced by a transitional government, which struggles to run the country today with regional militias still holding on to much power. As the new Government of Libya works to assert its elected authority, armed militias, former revolutionaries, tribes and clans within Libya engage in criminal activity for profit, including theft, weapons trafficking, and extortion. It is a transit and destination country for large numbers of migrants from sub-Saharan Africa and Egypt and is a destination and transit point for smuggled goods, particularly black market and counterfeit goods from sub-Saharan Africa. The markets remain primarily cash-based, and informal value transfer networks are present. Hawaldars are often used to facilitate trade and small project finance. Libya's geographic position, porous borders and limited law enforcement capacity make it an attractive transit point for narcotics. Corruption remains a serious problem. Libya is ranked 160 out of 176 countries in Transparency International's 2012 International Corruption Perception Index.

The Libyan Islamic Fighting Group (LIFG) - Libya
The Libyan Islamic Fighting Group (LIFG) was designated by the US as a Foreign Terrorist Organisation on December 17, 2004. In the early 1990s, LIFG emerged from a group of Libyans who had fought Soviet forces in Afghanistan and pledged to overthrow Libyan leader Muammar Gaddafi. In the years following, some members maintained an anti-Gaddafi focus and targeted Libyan government interests. Others, such as Abu al-Faraj al-Libi, who was arrested in Pakistan in 2005, became aligned with bin Laden and are believed to be part of the Al-Qaeda (AQ) leadership structure. On 3 November 2007, AQ leader Ayman al-Zawahiri announced a formal merger between AQ and LIFG. However, on 3 July 2009, LIFG members in the UK released a statement formally disavowing any association with

AQ. In September 2009, six imprisoned LIFG members issued a 417-page document that renounced violence. More than 100 LIFG members pledged to adhere to this revised doctrine and have been pardoned and released from prison in Libya since September 2009. LIFG has been largely inactive operationally in Libya since the late 1990s when members fled predominately to Europe and the Middle East because of tightened Libyan security measures. In early 2011, in the wake of the Libyan revolution and the fall of Gaddafi, LIFG members created the LIFG successor group, the Libyan Islamic Movement for Change (LIMC), and became one of many rebel groups united under the umbrella of the opposition leadership known as the Transitional National Council. Former LIFG emir and LIMC leader Abdel Hakim Bil-Hajj was appointed the Libyan Transitional Council's Tripoli military commander during the Libyan uprisings and has denied any link between his group and AQ.

Morocco

The Moroccan royal family dates its ancestry back almost 500 years and took power upon independence in 1956 after periods of interest by Spain and then France. The current monarch is King Mohammed VI. Morocco also exercises de facto administrative control in Western Sahara and enjoys a moderately free press, but the government has taken action against journalists who they perceive to be challenging the monarchy, Islam or the status of Western Sahara. Influenced by protests elsewhere in the region, and then in Morocco, King Mohammed VI responded with a reform programme. In 2012 the Justice and Development Party, a moderate Islamist party, won the largest number of seats, in the newly called for elections, becoming the first Islamist party to lead the Moroccan Government. Money laundering is a concern due to Morocco's international narcotics trade, vast informal sector, trafficking in persons, and large level of remittances from Moroccans living abroad. Cash-based transactions in connection with Morocco's substantial trade in cannabis are of particular concern. Criminal activities of risk include bulk cash smuggling and trade-based money laundering, including invoice fraud and the purchase of smuggled goods.

Moroccan Islamic Combatant Group (GICM) - Morocco

Designated as a Foreign Terrorist Organisation on 11 October 2005, the Moroccan Islamic Combatant Group (GICM) is a transnational terrorist group centred in the Moroccan diaspora communities of Western Europe. Its goals include establishing an Islamic state in Morocco. The group emerged in the 1990s and is composed of Moroccan recruits who trained in armed camps in Afghanistan, including some who fought in the Soviet war in Afghanistan. GICM members interact with other North African extremists, particularly in Europe. GICM members are believed to be among those responsible

for the 2004 Madrid train bombings, which killed 191 people. GICM members were also implicated in the recruitment network for Iraq, and at least one GICM member carried out a suicide attack against coalition forces in Iraq. According to open source reports, GICM individuals are believed to have participated in the 2003 Casablanca attacks. However, the group has largely been inactive since these attacks, and has not claimed responsibility for or had attacks attributed to them since the Madrid train bombings. In the past, GICM has been involved in narcotics trafficking in North Africa and Europe to fund its operations.

Tunisia

Rivalry between French and Italian interests in Tunisia culminated in a French invasion in 1881 and the creation of a protectorate. Agitation for independence in the decades after World War I was finally successful in getting the French to recognise Tunisia as an independent state in 1956. The country's first president, dominated the country for 31 years, repressing Islamic fundamentalism and establishing rights for women unmatched by any other Arab nation. In a 1987 bloodless coup, President Zine el Abidine Ben Ali took power. Whilst Islamic groups have agitated against the government, including the Tunisian Combatant Group, it was street protests that began in Tunis in December 2010 over high unemployment, corruption, widespread poverty and high food prices escalated in January 2011, that culminated in rioting with hundreds of deaths and would be the start of the Arab Spring. On 14 January 2011 Ben Ali dismissed the government and fled the country and by late January 2011, a "national unity government" was formed. Human rights activist Moncef Marzouki was elected as interim President.

Tunisian Combatant Group

The Tunisian Combatant Group (TCG) is a terrorist entity dedicated to the creation of an Islamic state in Tunisia. They are loosely organised and operate in small cells in Afghanistan and Western Europe. They target Tunisian interests as well as attacking Western targets and those of the US. TCG is nominally committed to a fairly specific objective, namely the creation of an Islamic state in Tunisia. However, members have been linked to Al-Qaeda and radical Islamist network in Western Europe that support Al-Qaeda and other terrorist operations. The Tunisian Combatant Group has assisted in recruiting, logistics, and the falsification of documents for the jihadist network in Europe. In addition to its ties to Al-Qaeda, TCG members are also associated with the Salafist Group for Preaching and Combat (GSPC). In December 2001, TCG's co-founder was arrested in Belgium for providing falsified documents to terrorists. In 2002, an Italian court sentenced several Tunisian Combatant Group members. These were the first convictions of Al-Qaeda associates in Europe following the September 11, 2001 attacks.

Special Focus 1

Al-Qaeda in the Islamic Maghreb (AQIM)

The Salafist Group for Call and Combat (GSPC) was already designated in the US as a Foreign Terrorist Organisation on March 27, 2002, but after the GSPC officially merged with Al-Qaeda (AQ) in September 2006 and became known as Al-Qaeda in the Islamic Maghreb (AQIM). AQIM

remains largely a regionally-focused terrorist group. It has adopted a more anti-Western rhetoric and ideology and has aspirations of overthrowing "apostate" African regimes and creating an Islamic Caliphate. AQIM factions in the northern Sahel (northern Mali, Niger, and Mauritania) conducted kidnap for ransom operations and conducted small-scale attacks and ambushes on security forces. The targets for kidnap for ransom are usually Western citizens from governments or third parties that have established a pattern of making concessions in the form of ransom payments for the release of individuals in custody.

In September 2010, AQIM claimed responsibility for the kidnapping of seven people working at a mine in Niger. AQIM released three of the hostages in February 2011, but at year's end, four French citizens remained in captivity. AQIM continued kidnapping operations throughout 2011. In January, AQIM kidnapped two French civilians in Niamey, Niger. The kidnappers later killed both hostages during a failed rescue attempt. In February, AQIM conducted its first abduction of a foreigner in Algeria since 2003 when it kidnapped an Italian tourist in Alidena. In October, AQIM kidnapped two Spanish and one Italian aid worker from a refugee camp near Tindouf, Algeria. In November, AQIM was responsible for the November 26 killing of a German man in Mali and the abduction of three men from the Netherlands, South Africa, and Sweden in Mali. AQIM members engage in kidnapping for ransom and criminal activities to finance their operations. Algerian expatriates and AQIM supporters abroad, many residing in Western Europe, provide limited financial and logistical support.

In 2013 AQIM took more than 800 hostages in a remote Gas facility in Algeria. After a tense stand-off, the crises ended with 40 hostages and 29 combatants dead. Counter terrorism pressure has pushed AQIM into the Sahara-Sahel and kidnapping and smuggling have become the most popular ways of raising finance as shown by one of Mokhtar Belmokhtar's many nom

de guerre : 'Mr Marlborough', a reference to his cigarette smuggling activities. It was he who led the splinter faction called the Islamist al Muthameen (Masked) Brigade or al Mu'aq'i'oon (those who sign with Blood) Brigade who attacked the gas facility. However, according to David Benjamin former Ambassador at Large and co-ordinator for counterterrorism at the US State Department and John Filiu Professor of Middle East Studies at Sciences Po in Paris in an article for the Center for Strategic and International Studies they believe that "There is no grand strategy of global jihadi expansion from North Africa and the Sahel. According to Filiu rising violence associated with Al-Qaeda in the Islamic Maghreb (AQIM) is instead fuelled by competition and escalation between various fragmented groups in the region. Daniel Benjamin agreed that militant activity in the region is focused locally, rather than globally and that the range of jihadist groups in the Maghreb and Sahel are fragmented, in conflict with one another, and ultimately defined by "gangsterism". Filiu argues that the various leaders within and without AQIM argue over tactics and territory. AQIM is still mainly an Algerian organisation notwithstanding Al-Qaeda's input and many militants from North Africa prefer to fight in Syria perceiving clearer and cleaner ideology. There is a clear link between jihadist and criminal activity and the groups are little more than "desert gangsters with little or no education" says Filiu.

The most sophisticated jihadi group in the region was the Libyan Islamic Fighting Group, which rejected Al-Qaeda's doctrines. Benjamin points out that AQIM activity for the past five years has been predominantly criminal rather than promoting jihad. A French official in charge of combatting terrorist finance suggests that "AQIM no longer relies on crime to finance terrorism. Now terrorism is used as a cover up for crime the sole purpose of which is to make a fortune." Filiu argues that the French governmental intervention in Mali was successful but AQIM and others in the region still demonstrate their ability to continue perpetrating attacks such as the January 2013 attack on the Gas facility in Algeria. Benjamin notes that the new regional norm will be one in which foreign governments and companies cannot rely on local governments to protect them. He suggests that the threat of North African jihadists will continue to be "a persistent but non-existent threat to regional and global security" also suggesting that it will not pose a security threat similar to that posed by the Federally Administered Tribal Areas (FATA) in Pakistan. Both agreed that development of real democracy is still the best antidote to jihadism across the region, with Benjamin adding that economic catastrophe, more than ideological radicalization, is most likely to bring new recruits to these groups.

A splinter group, the Movement for Oneness and Jihad in West Africa broke with AQIM in 2011.

West Africa

West Africa, is the westernmost region of the African continent, south and West of the Maghreb and North and West of Central Africa. West Africa includes, Burkina Faso and Niger which are mostly in the Sahel, a transition zone between the Sahara desert and the Savanna as well as Benin,

Côte d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Senegal, Sierra Leone, Togo, and Nigeria. The area also includes Cape Verde, an island country in the Atlantic Ocean. All these countries are members of the Economic Community of West African States (ECOWAS) set up in May 1975. In contrast to most of Southern and Central Africa, West Africa is not populated by Bantu-speaking peoples.

Islam is the predominant religion of the West African interior and the far west coast of the continent. Traditional Muslim areas include parts of Senegal, Gambia, Mali, Guinea, Niger; the inland areas of Sierra Leone and Liberia; the western, northern and far-eastern regions of Burkina Faso; and the northern halves of the coastal nations of Cameroon, Nigeria, Benin, Togo, Ghana and Ivory Coast. The rest is mainly considered as following Christianity, though each of Islam and Christianity in the region mixes with traditional African religious traditions including voodoo.

The history of West Africa includes settlers from the empires of the Mediterranean and trade by sea and across the deserts with the North following the domestication of the camel. Much later the region became a centre for the European slave trade, with settlements along the coast being established by first Portuguese, the French and the English. In the early 19th century, Britain controlled the Gambia, Sierra Leone, Ghana, and Nigeria throughout the colonial era, while France unified Senegal, Guinea, Mali, Burkina Faso, Benin, Ivory Coast and Niger into French West Africa. Portugal founded the colony of Guinea-Bissau. Following World War II, nationalist movements arose across West Africa. In 1957, Ghana became the first sub-Saharan colony to achieve its independence. By 1974, West Africa's nations were entirely autonomous. Since independence, many West African nations have been submerged under political instability, with notable civil wars in Nigeria, Sierra Leone, Liberia, and Ivory Coast, and a succession of military coups in Ghana and Burkina Faso.

Much of West Africa suffers from endemic corruption, weak law enforcement and the informal cash-based economy provide a fertile environment for other illegal

activities that are predicate offenses for money laundering. There is an extensive black market for smuggled goods and in diamond producing countries such as Sierra Leone, a problem of smuggling diamonds and precious metals in the region.

The regional giant is Nigeria, with its vast oil wealth, a population that includes one in every five Africans and a willingness to get involved into regional conflicts have made the country a power in West Africa and a political force across the continent. Nigeria is the region's largest economy representing 55% of West Africa's gross domestic product, the most populous nation on the continent at an estimated 130 million people and the continent's largest oil producer. Nigeria played a pivotal role in founding the Economic Community of West African States, or ECOWAS, in 1975 as a regional economic organisation of 15 member countries

Nigeria

The English-speaking Republic of Nigeria in the Western part of Africa surrounded by French speaking Chad, Benin, Cameroon and Niger and with a population of 160 million in terms of size and population is the largest country in sub-Saharan Africa. Nigeria received in 1914 its name and final geographical entity when the British amalgamated the former Protectorates of Northern Muslim and Southern Christian Nigeria. The country became independent in 1960. During the over 50 years of independence repeated military interventions led to political instability and endemic corruption. From 1999 when the military finally handed over power soon after the death of Sani Abacha, one of the most corrupt leaders in history to a democratically elected government headed by Olusegun Obasanjo the fight against corruption has been made a top priority of each democratic government, though progress has been made real concerns remain. Still, certain top public officials whilst in office benefit from immunity from prosecution which hinders the fight against corruption as does the lack of any transparency of income and wealth for these and other public officials, though this is not exceptional and applies to many countries and not just Nigeria. Estimates of revenues lost through corruption vary, though most agree that the figures are likely to be in the tens of billions of US\$, and whilst some seek to bank these illicit funds in offshore bank accounts it is considered more likely that the funds will be converted and used to acquire properties, luxury cars and shares in blue chip companies, amongst other things. According to Transparency International, Nigeria ranks 144 out of 175 in its 2013 Corruption Perception Index.

The divide between North and South is increasingly marked with the differences in religion between Muslims and Christians exacerbated by terrorist groups such as Boko Haram and between rich and poor and the wealth generated out of the Oil in the Niger Delta little of which benefits the locals and the environmental

damage that is also prevalent and is the main complaint of MEND the Movement for the Emancipation of the Niger Delta. Nigeria is a leading petroleum producer and exporter, the 11th largest producer of petroleum in the world and ranked 10th, and 8th respectively for proven petroleum and natural gas reserves. It is the most important economic power of West Africa, producing approximately 50% of the regional GDP. To try to address the North South divide, there is a convention that requires the Nigerian Presidency to rotate between a member of the Muslim north and the Christian south. Current President is Goodluck Jonathan a Christian from the south and former vice president under President Yar'Adua, a Muslim from the North who died in May 2010.

Nigerian Crime Gangs

Whilst domestic crime is also a problem, Nigerian criminal gangs are also active internationally. While Nigerian organised crime networks are a relatively new phenomenon, they have nonetheless grown quickly in size and influence. The rise of Nigerian crime syndicates has been aided by the region's political corruption and instability, alongside economic setbacks such as the oil crisis of the 1980s. The large Nigerian diaspora community is a further supporting factor in the ascendancy of crime gangs from this area, who find at their disposal a readily accessible recruitment pool in many foreign states. At present no consensus exists as to the definite organisational structure of the Nigerian crime groups; some believing them to be modelled on western mafia-like hierarchies, while others perceive them to be organised around the cohesion of small independent groups. Less contested is the ethnic and tribal dimension that can be seen to run through the Nigerian crime groups. In terms of activity, Nigerian gangs are known to participate in drug trafficking, forgery, counterfeiting, money laundering and human trafficking, particularly in conjunction with the sex trade. They are particularly famed for their identity scams. As a result of the activity of these groups Nigeria, despite producing only small drug quantities, has become a hub for the transportation of heroine and cocaine. Nigerian crime networks are known to have links with other groups of international influence, such as the Colombian cartels and African American drug dealers.³ Beyond their own state, the territories of direct Nigerian operation include West African countries, South Africa, the UK, France, Belgium, Spain, Italy, the Netherlands and Greece.

Nigerian crime groups are also known to operate as far afield as the US, South America and Australia. Nigerian crime groups have become so well known for their financial scams that a diverse range of fraud transactions are referred to simply as Nigerian or 419 scams (indicating the article of Nigerian law that prohibits them). The Nigerian 419 scam is a deception technique whose lineage can be traced back into the sixteenth century with the emergence of the Spanish Prisoner Letter. This original ruse told the tale of a wealthy man incarcerated

in Spain, who required a small sum of money to be paid to prison guards as bribes. On release the wealthy former prisoner would return the funds of his kind benefactor, alongside a healthy return. This would of course never happen and the original sum paid would be lost. While the medium of communication has changed somewhat from the days when letters might be received from imprisoned noblemen, the content of the messages has changed little over the centuries. Similar language techniques are used to create trust and the portrayed circumstances are informed by current events to increase their plausibility; commonly e-mails are received from businessmen purportedly seeking to transfer funds out of an unstable zone recently featured in news coverage. E-mail technology has allowed fraudsters to reach millions of people across the world, and while the majority do not respond to their requests, a very small minority are convinced and consequently fall victim to this form of fraud.

The Movement for the Emancipation of the Niger Delta (MEND) - Nigeria

MEND is a terrorist group that uses violent means to support the rights of the ethnic Ijaw people in the Niger Delta. In contrast to the healthy profit margins enjoyed by foreign oil companies most Nigerians in the Delta region live in poverty. These conditions have led to the proliferation of local terrorist groups numbering around 120. Of these organisations, MEND is one of the largest, and it works closely with other militant groups. Notably, the Niger Delta People's Volunteer Force (NDPVF), the Coalition for Militant Action in the Niger Delta, and the Martyrs' Brigade. Led by a notoriously shadowy and secretive elite cadre, MEND's ultimate goal is to expel foreign oil companies and Nigerians not indigenous to the Delta region from Ijaw land. In the short run, the group wishes to increase local control over money made from the exploitation of the region's abundant natural resources. For instance, the organisation recently pressured the government to demand the payment of US\$1.5billion from Shell Oil for damage done to the local environment. MEND also wants the central government to provide basic services such as running water to the region and increase government investment in the area's infrastructure. Finally, MEND wishes to secure the release of imprisoned Ijaw advocates Alhaji Dokubo-Asari, a leader of NDPVF, and Diepreye Alamieyeseigha, the former governor of Bayelsa State. MEND's tactics have evolved from crude kidnapping-for-ransom operations into more sophisticated and effective methods that combine actions such as hostage-taking and bombings with the effective use of local and increasingly international media propaganda campaigns. MEND bombings usually target key points in oil pipelines and facilities in the Delta to maximize disruption and cost to foreign oil companies. In February 2006 MEND issued a declaration of "total war"³ on foreign oil and the subsequent "dark February" campaign of violence.⁴

Special Focus 2

Boko Haram - Nigeria

The group Jama'atu Ahlis Sunna Lidd'awati wal-Jihad, known better as Boko Haram, is an extremist Islamic sect in Nigeria that has created havoc across the north of the country and in the capital, Abuja. Its violent attacks on government offices, the UN, and Christian churches

threaten to destabilize the country. Since August 2011 Boko Haram has planted bombs almost weekly in public or in churches in Nigeria's northeast. Formed in 2002 the organisation is motivated by its desire to establish an Islamic state in place of the current democratic government and to eradicate all Western influences in Nigerian society. Even activities broadly associated with the West are prohibited by the group, including voting in elections and receiving a secular education. This last prohibition has led the group to target the Nigerian education system and initiate a campaign of arson against schools.⁵

In March 2012, 12 public schools in Maiduguri were burned down during the night, and as many as 10,000 pupils were forced out of education.⁴ Boko Haram has also become infamous for its deployment of gunmen mounted on motorbikes, commonly used to eliminate prominent opposition figures in swift attacks. Historically, the group can trace its origins to the Sokoto Caliphate. Formerly one of sub-Saharan Africa's leading empires the Islamic Sokoto Caliphate spanned parts of northern Nigeria, Niger and southern Cameroon from 1809-1903, when it was conquered by the British. Throughout the colonial period and following independence the Muslims of this geographical and spiritual community have strongly resisted Western influence. The reclamation of the Soko Caliphate territories remains Boko Haram's objective and the communities located in these areas continue to be their main support base. In 2011 the organisation was brought to the attention of the international community as a result of multiple bombings, including the 2011 Christmas Day bombings on the outskirts of Nigeria's capital. A US Congressional Report published in the same year described Boko Haram as an emerging threat and speculated that the group may be forming links with Al-Qaeda. In February of 2012 information surrounding the funding of Boko Haram emerged from a Nigerian state security investigation. According to the findings of this investigation the group relied on a combination of member donations, however support from the terrorist group Al-Qaeda in the Islamic Maghreb (AQIM) later allowed the group to channel revenue from further

afeld. Consequently funding is believed to have been received from support groups in Saudi Arabia and the UK. Also amongst the investigations findings are alleged financial links between Boko Haram and an Islamic society based in Saudi Arabia. Boko Haram remains operative in Nigeria and is considered a threat to both Nigerian citizens and foreign nationals. Ansaru or the Vanguard for the Protection of Muslims in Black Lands is an Islamist jihadist organisation based in the northeast of Nigeria. Whilst it is an offshoot of Boko Haram founded in 2012, it is less aggressive to non-muslims than Boko Haram and is thought to have a more international focus.

Area Boys (Agberos) - Nigeria

A loosely organised group of teenagers and abandoned youth that roam the streets of Lagos, Nigeria this group has been known for its practices of extortion and drug violence. One of the methods the groups use for extortion is to surround pedestrians, drivers and passengers in vehicles, which are stuck in traffic, and force them to pay before letting them go. Area Boys, who are largely "Yoruba" have existed in the city since the 1980s, however they can trace their origins back to the 1920s. In 2007 the number of Area Boys in Lagos was estimated at over 35,000.

Sierra Leone

The history of Sierra Leone as an independent nation began in 1961, though the lands had been inhabited since at least 2,500 years ago. Sierra Leone began as a colony of freed British slaves. Recent history has been dominated by the eleven year war which lasted from 1991 until 2002, which was characterized by extreme brutality and widespread human rights abuses against civilians. The majority of the crimes were perpetrated by rebels from the Armed Forces Revolutionary Council (AFRC) and the Revolutionary United Front (RUF). However, government forces and their allies, notably the Civil Defense Forces (CDF), also committed serious crimes, albeit on a smaller scale and of a different nature than those by rebel groups. During the conflict, tens of thousands of civilians were killed and up to one-quarter of the population was displaced. During the war, rebels, and to a lesser extent government forces, consistently failed to distinguish between civilians and combatants. Hundreds of civilians suffered from the signature rebel atrocity of limb amputation while thousands of girls and women were subjected to sexual violence. All sides recruited and used child combatants. Sierra Leone, particularly via its large seaport and porous borders, together with pervasive corruption make it conducive to money laundering, for illegal drugs or other forms of illegal commerce, for example the smuggling of pharmaceuticals, foodstuffs, gold, and diamonds. Transactions at most levels, money exchanges, and remittances are very informal and based on cash and vulnerable to money laundering.

Revolutionary United Front - Sierra Leone

The Revolutionary United Front (RUF) was a rebel army that fought a failed eleven-year war in Sierra Leone, starting in 1991 and ending in 2002. It later developed into a political party, which existed until 2007. The three most senior surviving leaders were convicted in February 2009 of war crimes and crimes against humanity. The Revolutionary United Front initially coalesced as a group of Sierra Leoneans which led National Patriotic Front of Liberia elements across the border in an attempt to replicate Charles Taylor's earlier success in toppling the Liberian government. The RUF was created with substantial assistance from Charles Taylor of Liberia and from Libya when in 1988 a group of 25-50 Sierra Leoneans travelled to Libya and received training under the Muammar Gaddafi regime.

At first, the RUF was popular with Sierra Leoneans, many of whom resented a Freetown elite seen as corrupt and looked forward to promised free education and health care and equitable sharing of diamond revenues. However, the RUF developed a reputation internationally for enormous cruelty during its decade-long struggle and resources itself from diamond mines in territory under its control. The cruelty included recruiting child soldiers, some forced to kill their parents, and using machetes, RUF rebels amputated the hands, arms, and legs of tens of thousands of Sierra Leoneans, the reason for these actions was that amputees could no longer mine diamonds, which might be used to support government troops, or fire weapons against them. Sierra Leone's economy collapsed, with ordinary citizens trapped between the cruelty of RUF troops and starvation. It became notorious for its use of child soldiers, many of whom it kidnapped and conscripted, often forcing the children to inject cocaine before sending them off to fight. The RUF continued to fight the multiple successive governments of Sierra Leone through the 1990s and, with support from Charles Taylor, intermittently occupied the diamond-producing areas of Sierra Leone, contributing to the "blood diamond" trade of West Africa.

The RUF began to suffer major setbacks when Executive Outcomes (EO), a private security firm hired by the Sierra Leonean government, pushed the rebel group back from the capital, Freetown. After this, RUF announced a cease-fire and accepted peace talks with President Kabbah, which broke down and the fighting resumed. The RUF intensified its attacks, which first brought in a Nigerian-led West African force in 1998 to combat them and later in 2000, a British intervention finally secured the country for UN supervision. Disarmament of RUF rebels began in May 2001, and the war was officially declared over in January 2002, essentially the end of the RUF. The leader of the RUF Foday Sankoh died in prison in July 2003 while awaiting trial on charges of war crimes. The war is estimated to have cost the lives of 200,000 people.

Liberia

Liberia was established in the Nineteenth century as a settlement of freed slaves from the US. In 1980, a military coup led by Samuel Doe ushered in a decade of authoritarian rule and in 1989, the Liberian civil war broke out when the National Patriotic Front of Liberia (NPFL), led by Charles Taylor, invaded the country to oust the Liberian dictator. The NPFL soon assassinated Doe and Taylor became President. At the onset of the civil war in Sierra Leone, the Taylor-backed Revolutionary United Front (RUF) joined the war and would be later accused of fueling the conflict and indicted on charges of war crimes. Taylor under immense pressure and invasions from opposition groups left Liberia in 2003. After two years of rule by a transitional government, democratic elections in late 2005 brought President Ellen Johnson Sirleaf to power, who was also re-elected in 2011. The Liberian economy is essentially cash-based, with both Liberian and US dollars being legal tender, facilitating the laundering of US currency. Liberia has a significant market for smuggled goods, which are easily imported through its porous borders.

Mali

Mali, arose in its current form following the break up of French Colonies in West Africa in 1960. Rule by dictatorship was brought to a close in 1991 by a military coup that ushered in a period of democratic rule. Former President Amadou Toure was elected to a second term in 2007 in elections that were widely judged to be free and fair. Malian returnees from Libya in 2011 exacerbated tensions in northern Mali, and Tuareg ethnic militias including Ansar Dine, started a rebellion in January 2012, leading to the downfall of the President. The Chaos that followed led to initial Islamic success in taking control of Northern regions but these have been retaken by the military and since August of 2013, Ibrahim Boubacar Keita was elected president. Illegal proceeds in Mali derive from rampant trafficking of drugs, small arms, people, and everyday commodities across the Algerian, Nigerian and Mauritanian borders in the sparsely-populated north of the country. Authorities believe terrorist cells from Al-Qaeda in the Islamic Maghreb, known to operate in the north, are involved in smuggling as well as kidnapping for ransom to generate funds. The majority of Mali's economy is cash-based, making it difficult to track illegal or criminal financial transactions. Malian authorities believe proceeds being returned to South America from cocaine trafficking in Europe may be passed through Malian banks.

Ansar Dine - Mali

Ansar Dine means "helpers of the Islamic Religion" or "defenders of the faith" and is a militant Tuareg group with ties to AQIM with ambitions to impose Islamic law across Mali.

The Horn of Africa

The Horn of Africa (alternatively Northeast Africa or Somali Peninsula) is a peninsula in East Africa that juts hundreds of kilometers into the Arabian Sea and lies along the southern side of the Gulf of Aden. It is the easternmost projection of the African continent.

Referred to in ancient and medieval times as Bilad al-Barbar ("Land of the Barbarians"), the Horn of Africa denotes the region containing the countries of Eritrea, Djibouti, Ethiopia and Somalia.

Djibouti

The French Territory of the Afars and the Issas became Djibouti in 1977. A Somali Issa dominated authoritarian government ruled until 1999, during which unrest among the Afar minority led to a civil war that finally ended in 2001 with a peace accord between the two sides. In 1999, Djibouti's first multiparty presidential elections resulted in the election of Ismail Omar Guelleh, who continues to rule today as President in his third term. Djibouti is today one of the most stable countries in the Horn of Africa, occupying a strategic geographic location at the intersection of the Red Sea and the Gulf of Aden and serves as an important shipping lane for goods entering and leaving the east African highlands and transshipments between Europe, the Middle East, and Asia. The government holds long-standing ties to France, which maintains a significant military presence in the country, and has strong ties with the US.

There are also allegations of some financial facilitation for Somali based Al-Shabaab and involvement in the laundering of some Somali ransom payments derived from piracy. Smuggled goods include high taxed cigarettes and alcohol. Djibouti is a transit, source, and destination country for men, women, and children subjected to forced labour and sex trafficking. Economic migrants from East Africa en route to Yemen and other Middle East locations are also vulnerable to exploitation in Djibouti.

Eritrea

The UN established Eritrea as an autonomous region within the Ethiopian federation in 1952. Ethiopia's full annexation of Eritrea as a province 10 years later sparked a violent 30-year struggle for independence that

ended in 1991 with Eritrean rebels defeating Ethiopian government forces. Eritreans overwhelmingly approved independence in a 1993 referendum. Isaias Afeworki is considered highly autocratic and repressive, ruling as President since independence.

There are concerns that the Eritrean government and military officials profit from contraband smuggling and extortion. Due to its informal cash economy, underground remittances and the prevalent use of money/value transfer systems, alongside proximity to regions where terrorist and criminal organisations operate, and widespread corruption Eritrea make this combination of concern. Eritrea is believed to have been a haven for organisations affiliated with Al-Qaeda and Al-Shabaab, with some considering that elements of the Eritrean security apparatus provide training, supplies and financing to regional destabilisers, indeed past support to insurgents in neighboring states resulted in the UN Security Council (UNSC) levying an arms embargo against Eritrea in 2009. By 2012, the UN concluded that Eritrea had reduced or eliminated direct support for Al-Shabaab, but recommended maintaining the existing arms embargo until greater transparency is achieved. Eritrea is a source country for men, women, and children subjected to forced labour and, to a lesser extent, sex trafficking.

Ethiopia

Ethiopia has the distinction, among African countries, of largely avoiding European colonial rule, with the exception of a short-lived Italian occupation from 1936-41. In 1974, a military junta, the Derg, deposed Emperor Haile Selassie, (who had ruled since 1930) and established a socialist state. Torn by bloody coups, uprisings, wide-scale drought, and massive refugee problems, the regime was finally toppled in 1991 by a coalition of rebel forces, the Ethiopian People's Revolutionary Democratic Front (EPRDF). A border war with Eritrea late in the 1990s ended with a peace treaty in December 2000. In 2007 Ethiopian forces invaded southern Somalia to stop the rise of the Council of Islamist Courts routing them from Mogadishu and elsewhere in Somalia.

Ethiopia's location within the Horn of Africa makes it vulnerable to money laundering-related activities perpetrated by transnational criminal organisations, terrorists, and narcotics trafficking organisations. Sources of illegal proceeds include corruption, smuggling, and trafficking in narcotics, persons, arms, and animal products. Ethiopia is a transit hub for heroin originating in Southwest and Southeast Asia and destined for Europe, as well as cocaine destined for markets in southern Africa; Khat is cultivated for local use and regional export, principally to Djibouti and Somalia (legal in all three countries). High tariffs encourage customs fraud and trade-related money laundering. Law enforcement sources indicate money and value transfer systems, particularly hawala, are widely used.

Somalia

Both British and Italian Somaliland joined together in 1960 to form the new nation of Somalia. In 1969, a coup ushered in an authoritarian socialist rule. After the regime's collapse early in 1991, Somalia descended into turmoil, factional fighting, and anarchy.

In May 1991, northern clans declared an independent Republic of Somaliland. Although not recognised by any government, this entity has maintained a stable existence and continues efforts to establish a constitutional democracy, including holding municipal, parliamentary, and presidential elections. Another region, known as Puntland has become a semi-autonomous state which has been self-governing since 1998.

In the meantime the rest of Somalia since 1991 has suffered from major internal strife, famine and civil war with warlords ruling areas and little central government control leading to it being considered for much of the time as a failed state. In 2000, a peace agreement resulted in the formation of an interim government, known as the Transitional National Government (TNG), which was succeeded in 2004 by the Transitional Federal Government (TFG). Both governments faced constant opposition from Islamic Somali militant groups. For example, Al-Ittihad al-Islamiya co-operated with Al-Qaeda operators who carried out the [1988 US Embassy Bombings](#) in East Africa. The Group was succeeded by the Council of Islamic Courts that made major territorial gains against the TFG including the capture of the capital Mogadishu. Ethiopian forces responded invading southern Somalia and routing the Council of Islamist Courts in 2007, leaving once the TFG had been re-established in 2009. Recent elections in 2012 have been widely hailed as a great success, with Hassan Sheikh Mohamud, a moderate Muslim, emerging as the country's new leader. The Somali National Army forces, alongside troops from the African Union Mission in Somalia, have continued to combat the successor group to the Council of Islamic Courts, known as Al-Shabaab, making significant gains against the terrorist group, pushing the extremist militia out of all major cities it previously held.

Nevertheless the influence of Al-Shabaab has not been dispelled from Somalia, nor from its effects on its neighbors particularly in Kenya. Somalia does not have a formal financial system, and the majority of financial entities operating in Somalia, such as money transmitters and hawaladars, are not supervised or monitored by regulatory or enforcement agencies. Smuggling is rampant. Somalia has one of the longest land borders as well as the longest coastline in Africa. Public and private sector corruption, remains a significant concern, with Somalia ranking 175 of 175 countries on Transparency International's 2013 Corruption Perception Index. Although acts of piracy off the coast of Somalia have de-

creased significantly over the past 18 months, proceeds from ransom payments still contribute to Somalia's illicit activity. The ransoms are delivered through cash drops to pirates holding ships off Somalia's coast. They are divided among the pirates themselves, their support networks on shore, and possibly national and international sponsors. Much of the ransom reportedly remains in cash.

Special Focus 3 Al-Shabaab - Somalia

Al-Shabaab, or 'the youth', is the name generally applied to the Somali militant group which was formerly the most prominent of the militia groups comprising the militant wing of the Council of Islamic Courts (CIC), itself a successor organisation of Al-Ittihad al-Islamiya. Al-Ittihad was

associated with bin Laden and co-operated with Al-Qaeda operators who carried out the [1988 US Embassy Bombings](#) in East Africa. The group, which proclaims its intention to establish an Islamic state encompassing the Muslim dominated territories of Somalia, Somaliland, Puntland, north-eastern Kenya, the Ogaden region of Ethiopia and Djibouti, has, since the TFG's seizure of power, conducted violent insurgency against government targets. Al-Shabaab has also pledged to eliminate the influence and presence of foreign 'infidels'. In terms of organisation, the group is based around the allegiance and coherence of a number of regional leaders, many of whom led very distinct factions. Estimates of the group's size range from 3,000 to 7,000 members, the bulk of which are drawn from Somalia. The group is known to have links with Al-Qaeda, to whom Al-Shabaab leader Mukhtar Abu al-Zubair has publicly pledged allegiance. In January 2013 Al-Shabaab targeted the Somali presidential palace with a suicide bombing. The most recent attack in September 2013 in a [Nairobi Shopping Centre](#) provides ample evidence that Al-Shabaab continues to pose a very real threat in Somalia and with its neighbours posing a threat beyond its borders and is a concern for security experts in large part due to a significant far flung diaspora, including 2 million in America (especially Minnesota), in the UK (London and Cardiff), Scandinavia and Kenya, concerned that some may pose direct threats as an Al-Qaeda affiliate in these Countries and/or in recruitment of Al-Shabaab volunteers and as a source for financing. Al-Shabaab also receives financing from multiple sources, mainly from the illicit trade in charcoal from its controlled territories.

Eastern Africa

Eastern Africa comprises at its core the three countries of Kenya, Tanzania and Uganda. Whilst some other countries could be included, they nevertheless can be better placed in the Horn of Africa, for example Djibouti, Eritrea, Ethiopia, and Somalia, or in Central Africa in the

case of Burundi and Rwanda, with Mozambique which can be considered part of Southern Africa. That leaves Sudan and South Sudan, Comoros, Madagascar, Malawi, Mayotte, Mauritius, Réunion and Seychelles as part of Eastern Africa.

East Africa is according to conventional wisdom, the origin of modern humans, who left East Africa to migrate all over the world. Between 2500–3000 years ago, Bantu-speaking peoples began a millennia-long series of migrations eastward from their homeland that is (modernly known as) southern Cameroon across the Rwenzori Mountains. This Bantu expansion introduced agriculture into those parts of East Africa either not reached previously by Nilo-Saharan farmers or too wet for millet. During the following fifteen centuries, the Bantu slowly intensified farming and grazing over all suitable regions of East Africa, in the process making contact with Austronesian- and Arabic-speaking sailors on the southern coastal areas. The latter also spread Islam to the coastal belt, but most Bantu never had contact with Islam and remained animists. The Bantu expansion was followed by the Nilotic expansion across parts of East Africa during the 14th to 18th centuries.

Sudan

The Sudan is located in Northeastern Africa and it is the largest country in Africa. It is also the tenth largest country in the world based on area. Sudan is not part of Sub Saharan Africa as the Sahara technically starts to the West of Sudan and is more accurately described as either part of the Nile river delta or instead great East Africa. Sudan has a long history of civil wars as well as political and social instability. Most recently Sudan split when South Sudan, mainly Christian seceded from mainly Muslim Sudan in 2011, following a decades long Civil war.

Sudan has a long history that begins with its being a collection of small kingdoms until Egypt conquered the area in the early 1800s. At this time however, Egypt only controlled the northern portions, while the south was made up of independent tribes. In 1881, Muham-

mad ibn Abdalla, also known as Mahdi, began a crusade to unify western and central Sudan which created the Umma Party. In 1885, the Mahdi led a revolt but he died soon after and in 1898, Egypt and the UK regained joint control of the area, until Independence was gained in 1956. Sudan's first leaders began to renege on promises to create a federal system which began a long period of civil war in the country between the northern and southern areas as the north has long tried to implement Muslim policies and customs. [The Sudan People's Liberation Army](#) fought against the government throughout this time.

A second separate conflict, has led to genocide charges being brought against the current President of Sudan, Omar Bashir. The conflict which broke out in the Western region of Sudan known as Darfur in 2003, which is home to about 6 million people and is about the size of France. Darfur is home to racially mixed tribes of settled peasants, who identify as African, and nomadic herders, who identify as Arab. The majority of people in both groups are Muslim. The African groups, after suffering years of government sponsored neglect and racism launched an uprising. The government responded by implementing their campaign of genocide, enlisting the help of Arab militia in Darfur called the Janjaweed. The dispute is racial, not religious: Muslim Arab Sudanese are killing Muslim black Sudanese. The Janjaweed are the armed militia supported by the Sudanese Government who carry out the genocide, alongside and independent of, the Sudanese Army. Up to 400,000 people have died due as result of direct attacks and conflict induced malnutrition and disease. The vast majority of these have been women, children and civilian men and millions have been displaced. A UN peacekeeping force is now operating in the region.

Sudan is designated by the US since 1993 a "state sponsor of terrorism," alleging it harboured local and international terrorists, including bin Laden, Hezbollah, Hamas, Palestinian Islamic Jihad, the Abu Nidal Organisation, Jamaat al-Islamiya, and Egyptian Islamic Jihad. US investigators also linked two Sudanese diplomats to a terrorist cell planning to bomb the UN building in New York. In 1998, Al-Qaeda operatives based in Sudan were allegedly involved in the [bombings of US Embassies in Kenya and Tanzania](#). Throughout the 1990s, Sudan was also accused of supporting local insurgencies in Uganda, Tunisia, Kenya, Ethiopia, and Eritrea. In 1997, the U.S. imposed comprehensive economic, trade, and financial sanctions against Sudan. In 1996, the UN Security Council placed sanctions (PDF) on Sudan for harboring suspects wanted for the attempted assassination of President Hosni Mubarak of Egypt. The UN lifted terror related sanctions in 2007 following Sudan's willingness to combat terrorism, also welcomed by the US, though US sanctions remain in part due to its continued support for Hamas. Its relationship with the US and other Western states also remains troubled because of the humanitarian crisis in Darfur, as well as US allegations that Sudan is assisting the Iraqi insur-

gency by permitting militants from Sudan and other nations to transit to Iraq.

Sudan currently has limited access to international financial markets and institutions because of comprehensive U.S. economic sanctions. Traders and other legitimate business persons often carry large sums of cash because Sudan is largely a cash-based society and electronic transfer of money outside of Sudan is challenging. This dependence on large amounts of cash complicates enforcement efforts and makes Sudan's banking system vulnerable to money laundering. Comprehensive sanctions also contribute to a significant black market for smuggled goods, making Sudan vulnerable to trade-based money laundering. Sudan is ranked 174 of 175 countries on Transparency International's 2013 Corruption Perception Index.

South Sudan

On 9 July 2011, the Republic of South Sudan became the World's newest state following the ending of the Sudanese Civil War and independence following a 2002 Agreement. Whilst the Government of Sudan was established with the support of the two largest tribes, the Dinka tribe led by President Salva Kiir, and the Nuer tribe led by former Vice President Riek Machar. With the sacking of the Vice President in July 2013 stability has been lost and violence, particularly tribal based atrocities, is leading to the outbreak of a civil war. As a result, oil production, which accounts for 98% of government revenue, had fallen by a quarter as a result of the violence and to many the real reason for the conflict.

South Sudan is not a major financial centre, and as such, there is little major financial crime; however, corruption is widespread in this oil rich state. The GOSS does not yet have significant laws, regulations, or enforcement capacity in place to address financial crimes. South Sudan has a cash-based economy. With no anti-money laundering/counter-terrorist financing (AML/CFT) regime, and its large and porous borders, South Sudan is vulnerable to exploitation by criminals of every type, including those seeking illicit routes to transport money via bulk cash smuggling and those wishing to perpetrate other forms of financial crime.

Sudan People's Liberation Army - South Sudan

The Sudan People's Liberation Army (SPLA) was formed in 1983 to oppose the implementation of sharia law, or strict Islamic law, by Sudanese President Nimeiri. While the largely Muslim population of Sudan's Northern provinces generally welcomed the change, the Christians and Animists of southern Sudan were alarmed. According to the treaty that had ended the country's first civil war in 1972, the South was to maintain its autonomy from the North. Nimeiri's attempt to implement sharia nationwide violated that agreement and created widespread resentment among the South-

ern population. Sent by the Army to quell a mutiny in the South, Lt. Col. John Garang instead embraced the insurrection and became its leader, forming the SPLA. From an initial nucleus of 500 soldiers in 1983, Garang's rebel army grew rapidly, hitting an estimated 50,000 to 60,000 by 1991. The group's stated goal was the formation of a secular, democratic Sudan. In the mid-nineties, the SPLA became the vanguard element of a rebel umbrella organisation, the National Democratic Alliance, which even contained some moderate Muslim parties. The SPLA's success, however, cost the citizens of Sudan dearly. It is estimated that the civil war, which did not cease until 2002, took some 1.5 million lives. Although the SPLA was primarily designed to perform military operations against the Sudanese Army, it also engaged in a few acts of terrorism against westerners and western interests in the country. In 1999, the SPLA took six Red Cross workers hostage, four of whom died in captivity. Although SPLA spokespeople claim that the deaths occurred during a botched rescue attempt, the Sudanese government claims that they were executed. Two years later, the SPLA claimed responsibility for one successful bombing and one unsuccessful bombing attempt against oil companies operating in Southern Sudan. The SPLA specifically targeted the oil industry to prevent oil proceeds from strengthening the government forces.

In 2002 the Khartoum government and the rebels were able to hammer out a power-sharing agreement that has ended, or at least significantly lowered the ferocity of, Sudan's civil war. As part of the implementation of this agreement, John Garang was named Vice-President of Sudan in 2004. As the SPLA has become a mainstream political force within Sudan, its interest in using terrorism as a means of achieving its goals has waned. On January 9th, 2005, the SPLA signed a peace agreement with the Khartoum regime, officially ending the Civil War that had ravaged Sudan since 1983. Under the terms of the agreement, southern Sudan would gain religious autonomy and a share of the nation's oil wealth and after a 6-year period of autonomy, residents of the South could vote on a referendum on whether to remain a part of Sudan or form an independent nation. On 9 July 2011, following the promised referendum that passed with a 98.3% of the vote, the world's newest independent State was born and is known as South Sudan.

Uganda

Uganda is a landlocked country in East Africa, bordered on the east by Kenya, on the north by South Sudan, on the west by the Democratic Republic of the Congo, on the southwest by Rwanda, and on the south by Tanzania. The southern part of the country includes a substantial portion of Lake Victoria, shared with Kenya and Tanzania. Uganda takes its name from the Buganda kingdom, which encompasses a large portion of the south of the country including the capital Kampala. Beginning in the late 1800s, the area was ruled as a colony

by the British. Uganda gained independence from Britain in 1962. The period since then has been marked by intermittent conflicts, most recently a lengthy civil war against the [Lord's Resistance Army](#), which has caused tens of thousands of casualties and displaced more than a million people. The current President of Uganda is Yoweri Kaguta Museveni, who came to power in a coup in 1986. Perhaps the most infamous figure in Ugandan recent history was that of former President Idi Amin, who came to power in a military coup in 1971. Amin ruled Uganda with the military for eight years and carried out mass killings within the country to maintain his rule. An estimated 300,000 Ugandans lost their lives at the hands of his regime, many of them in the north. Aside from his brutalities, he forcibly removed the entrepreneurial South Asian minority from Uganda, which left the country's economy in ruins. Amin's reign was ended after the Uganda-Tanzania War in 1979, in which Tanzanian forces aided by Ugandan exiles invaded Uganda.

Current President Yoweri Museveni, in power since 1986 was initially lauded by the West as part of a new generation of African leaders. As president, he has led Uganda in involvement in the civil war in the Democratic Republic of Congo (DRC) and other conflicts in the Great Lakes region. He has struggled for years in the civil war against the [Lord's Resistance Army](#), which has been guilty of numerous crimes against humanity, including child slavery and mass murder. The [Lord's Resistance Army \(LRA\)](#) seek shelter in southern Sudan and the Democratic Republic of the Congo's Garamba National Park; [LRA](#) forces have also attacked Kenyan villages across the border.

A 2012 report by the Center on Global Counterterrorism Cooperation concludes that Uganda is "deeply vulnerable to money laundering and terrorist financing" and that "money laundering is rampant in the country." Money laundering in Uganda derives largely from government corruption, misappropriation of public funds and foreign assistance, and abuse of the public procurement process. Other widespread offenses for money laundering in Uganda include arms and natural resource smuggling, exchange control violations, and human trafficking. Uganda's enormous cash-based informal economy provides a fertile environment for money laundering, as does its lack of anti-counterfeiting legislation which feeds a large black market for smuggled and/or counterfeit goods.

Lord's Resistance Army - Uganda

The militia that is today known as the Lord's Resistance Army ("LRA") was first formed in 1988 from the remnants of a defeated resistance movement amongst the Acholi people of northern Uganda. The conflict itself sprang from long-enduring ethnic tensions between the Acholi of the north and the Baganda of the south, the former fearing their marginalization by the latter. It was purportedly to continue this struggle for Acholi rights and establish a government based on the Chris-

tian faith's 10 Commandments that Joseph Kony united rebels of the Holy Spirit Movement and the Ugandan People's Democratic Army under one banner. However such intentions soon proved to be insincere and the LRA revealed itself to be driven by a personality cult centred on Kony rather than any political aspirations. Nevertheless, while the defence of Acholi rights has proved little more than a superficial justification for the armed struggle, the LRA does represent a continuation of some aspects of the former movement. For instance the LRA has adopted many of the spiritual traditions of the Holy Spirit Movement, a group also dominated by the personality of its leader and draped in a form of Christian mysticism peculiar to the region. Just as the Holy Spirit Movement's leader Lakwena expressed her messianic tendencies in the declaration that her warriors would be invincible if they rubbed themselves with shea butter, so Kony has asserted that his commands are taken from the spirit world and are therefore beyond questioning.

While the LRA at first gained support from the Acholi community located predominantly in northern Uganda, this support soon fell away amidst acts of cruelty perpetrated by the group. The organisation is renowned for its atrocities against defenceless village communities, raping, torturing and murdering indiscriminately. The abduction of young boys as a form of recruitment is also well-known, many of whom are rumoured to have been inducted in horrific rituals. Young girls are also abducted by the LRA to serve as sex slaves for the militia. Despite these atrocities, it is suspected that Kony's LRA secured the support of Omar al-Bashir's Sudanese government, who supplied the group with arms and financed their campaign in Uganda. This support however ended in 2002, a move that weakened the LRA and contributed to its retreat and dispersal into neighbouring countries.

In terms of numbers, the LRA in 2007 was estimated to have anywhere between 500 and 3,000 soldiers under its command, as well as 1,500 abducted women and children. Since then the strength of the organisation has deteriorated, with Ugandan Defence Minister Crispus Kiyonga estimating in 2012 that the LRA possessed only 200-250 active militants. These men seek refuge in the vast areas of jungle in northern Uganda and the surrounding countries, operating independently in squads of around 20 men.

Despite the LRA's reduced strength its violent activities continue; according to the LRA Crisis Tracker⁶ in January 2013: 3 civilian deaths and 13 abductions were perpetrated by the group. The LRA Crisis Tracker is maintained by an organisation that attempts to raise awareness of the humanitarian issues caused by the LRA and is the most comprehensive source of information on LRA activity publicly available. While the LRA has yet to be overcome with any degree of finality and its leader Joseph Kony remains at large, some international sanctions have been made against the group. In 2005 the International Criminal Court released arrest war-

rants for Kony and several members of the LRA senior leadership, and later Interpol supported this move by issuing red wanted notices to 184 countries for these 5 men. These notices effectively constitute an international arrest warrant, though formally the Interpol notices can only request arrest and extradition. The US has also undertaken efforts to counter the threat posed by the LRA, providing humanitarian and military support to the Ugandan government. Kony was also listed on the US Treasury Department's register of "Specially Designated Global Terrorists" in 2008, and in 2010 US President Barack Obama signed the Lord's Resistance Army Disarmament and Northern Uganda Recovery Act. This act led in 2011 to the deployment of 100 US Special Forces to the area in order to provide training and military guidance to Ugandan forces combating the LRA.⁷ In 2012 the African Union also pledged 5,000 troops to track and combat the LRA. Nevertheless the LRA and its leader Joseph Kony, though considerably weakened, remain at large and represent a considerable threat to communities in Northern Uganda and the neighbouring areas of South Sudan and the Democratic Republic of Congo.

Kenya

Kenya achieved its independence from Britain in 1963. The road to independence began in the 1950s with the Mau Mau rebellion. The Mau Mau movement was a militant African nationalist group that opposed British colonial rule and its exploitation of the native population. Mau Mau members, made up primarily of Kikuyu (the largest ethnic group in Kenya), carried out violent attacks against colonial leaders and white settlers. In 1952, the colonial government declared a state of emergency and arrested many Kenyan independence leaders, including moderates who had little or no connection to the Mau Mau, like Jomo Kenyatta, the then President of the Kenyan African Union. Whilst the British defeated the Mau Mau through a brutal campaign of military action and widespread detention of the Kikuyu, the rebellion led to reforms from which, working together with African and white Kenyan leaders, the country's transition to independence could be made. Jomo Kenyatta became the Country's first President and leading the country until his death in 1978 and as head of the Kenya African National Union (KANU). He was succeeded by President Daniel Arap Moi who ruled until 2002. The one party rule exacerbated ethnic divisions in the country and led to staggering levels of corruption. Following a campaign centered on an anticorruption platform, opposition leader Mwai Kibaki defeated KANU candidate Uhuru Kenyatta and assumed the presidency, though little was achieved in the anti corruption area once elected. By the time of the next election in 2007, widespread vote rigging concerns led to two months of violence resulting in as many as 1,500 people killed and a power-sharing accord between Kibaki and his opponent Rail Odinga.

In 2013. Uhuru Kenyatta, the son of founding president Jomo Kenyatta, won recent Presidential elections, despite being already indicted by the International Criminal Court charged with crimes against humanity, including murder, forcible population transfer and persecution, for his alleged role in the postelection violence in 2007 and early 2008. Jomo Kenyatta is also charged alongside the Deputy President William Samoei Ruto and both are also accused of responsibility for the criminal acts carried out by a criminal gang known as the Mungiki, which was allegedly under their control.

Kenya is the largest financial centre in East Africa. Kenya is a transit point for international drug traffickers. Kenya is a transit country for South Asian heroin destined for Europe and North America; Indian meths also transit on their way to South Africa. Trade-based money laundering is a problem in Kenya. There is a black market for smuggled goods in Kenya, which serves as a major transit country for Uganda, Somalia, Tanzania, Rwanda, Burundi, eastern Democratic Republic of Congo, and South Sudan. The laundering of funds derived from corruption, smuggling, illicit trade in counterfeit goods, drugs, wildlife trafficking and other financial crimes is a substantial problem. Its proximity to Somalia makes Kenya an attractive and likely destination for the laundering of piracy-related proceeds and a financial facilitation hub for Al-Shabaab. Although banks, wire services, and other formal channels execute funds transfers, there are also thriving, unregulated informal networks of hawala and other alternative remittance systems using cash-based unreported transfers. Foreign nationals, in particular the large Somali refugee population, primarily use hawala to send and receive remittances internationally. Mobile money, using telecom networks for cash transfers, is increasingly important. Kenya is a source, transit, and destination country for adults and children subjected to forced labour and sex trafficking.

Kenya ranks 136 out of 175 countries on the 2013 Transparency International Corruption Perceptions Index. Kenya is included in the October 19, 2012 Financial Action Task Force (FATF) Public Statement because it has not made sufficient progress in implementing its action plan and continues to have certain strategic anti-money laundering/counter-terrorist financing (AML/CFT) deficiencies. Kenya has been a target of terrorism, with the bombing of the US Embassy in Nairobi in 1998 when 224 died at the hands of the Egyptian Islamic Jihad and Al-Qaeda and most recently in 2013 when Al-Shabaab attacked Nairobi's Westgate Mall killing 67 people.

Mungiki - Kenya

This terrorist and organised crime gang, whose name denotes "A united people" or "multitude", began in the 1980s as a militia band based in the Kenyan highlands. The militia was formed with the purpose of protecting Kikuyu farmers from the predations of Maasai and government forces. The Mungiki arose from a social and

economic climate of deprivation and discontent. Rapid population growth resulted in mass unemployment and landlessness, with disaffected Kenyan youth finding their only sense of direction in the organised crime of the Mungiki. Effectively a conservative force in terms of its central ideology, the Mungiki gang rejects all western influence and anything believed to be tainted by the legacy of colonialism. Christianity is therefore rejected, as are many aspects of modernization that are deemed immoral or corrupting. Further anti-colonial sentiment can be detected in the Mungiki's image, which is thought to be modelled on that of the original Mau Mau fighters who violently opposed British rule.

The Mingiki first migrated to Nairobi in the 1990s, capitalising on the taxi trade, and later expanding into rubbish collection, construction, and protection services. The move to Nairobi resulted in the groups' progression from a single body to a cellular structure, with each cell containing 50 members who are then further sub-divided into platoons of 10 members. In more recent times the Mungiki have begun to play a far more prominent role in Kenya's public sphere, entering the political arena to support their favoured party. For instance during the 2002 election the Mungiki hired themselves out for the purposes of vote 'winning', and made their political allegiance with Kenya's KANU party. For around 100,000 Kenyan shillings the Mungiki could be paid to visit a neighbourhood, extracting votes by force. According to many sources an accurate estimate of the gang's size is very hard to achieve. The name Mungiki has become a brand name adopted by all those seeking to intimidate or extort, sometimes with no real connection to the gang.

Tanzania

Tanzania is a country in East Africa, bordered by Kenya and Uganda to the north; Rwanda, Burundi, and the Democratic Republic of the Congo to the west; and Zambia, Malawi, and Mozambique to the south. The country's eastern border is formed by the Indian Ocean. Kilimanjaro, Africa's highest mountain, is in northeastern Tanzania. Tanzania still includes the semi-autonomous islands of Zanzibar, and together with the mainland formerly known as Tanganyika, Tanzania merged and got its name in 1964 after it had achieved its independence from Britain and was led by President Julius Nyerere, after a relatively peaceful (compared with neighbouring Kenya, for instance) transition to independence. One-party rule ended in 1995 with the first democratic elections held. Today the President is Jakaya Mrisho Kikwete, elected in 2005.

Tanzania's location at the crossroads of southern, central and eastern Africa leaves it vulnerable to activities, such as smuggling and the trafficking of narcotics, arms, and humans, that generate illicit revenue. The major profit generating crimes in Tanzania include theft, robbery, corruption, smuggling of precious metals and stones,

and drug trafficking, with money laundering more likely to occur in the informal non-bank sectors. Mobile banking services, such as Mpesa and AirtelMoney, are growing rapidly in Tanzania, opening up formerly underserved rural areas to formal banking, but also creating new vulnerabilities in the financial sector. Criminals have been known to use front companies, hawaladars and bureaux de change to launder funds. Real estate and used car businesses also appear to be sources of money laundering. The use of front companies to launder money appears to be more common on the island of Zanzibar. Officials indicate money laundering schemes in Zanzibar generally take the form of foreign investment in the tourist industry. Bulk cash smuggling is also a problem. Tanzania is a source, transit, and destination country for men, women, and children subjected to forced labour and sex trafficking; the exploitation of young girls in domestic servitude continues to be Tanzania's largest human trafficking problem.

The Financial Action Task Force (FATF) included Tanzania in its October 19, 2012 Public Statement for its failure to adequately implement its action plan to address noted anti-money laundering/counter-terrorist financing (AML/CFT) deficiencies. Tanzania needs to implement procedures for identifying and freezing terrorist assets.

Madagascar

Formerly an independent kingdom, Madagascar became a French colony in 1896 but regained independence in 1960 and following lengthy one party rule free elections were held in 1992-93. Whilst alternating governments held power, the military intervened in 2009 in a coup following protests which toppled President Ravalomanana and installed as President the mayor of Antananarivo, Andry Rajoelina. Numerous attempts have been made by regional and international organisations to resolve the subsequent political gridlock by forming a power-sharing government and attempts are being made to hold new elections, likely to be contested by President Rajoelino and by his predecessors wife.

Madagascar is a producer and consumer of domestic cannabis and a transshipment point for heroin.

Madagascar's 3,000 miles of coastline facilitates smuggling and money laundering. Criminal proceeds laundered in Madagascar derive mostly from domestic criminal activity, but are often linked to international trade. The major sources of money laundering proceeds are tax evasion and customs fraud. Illegal mining activities and mineral resources including gemstones smuggling, protected flora and fauna smuggling, illegal logging, public corruption, and foreign currency smuggling are also areas of concern.

Central Africa

Central Africa is a core region of the African continent which includes Burundi, the Central African Republic, the Democratic Republic of the Congo, and Rwanda, but could also include a larger number of countries including also: Angola, Cameroon, Chad, the Republic of the

Congo, Equatorial Guinea, Gabon, and São Tomé and Príncipe. All these countries are members of the Economic Community of Central African States (ECCAS).

Central Africa is a region that is primarily inhabited by Bantu peoples originally from present-day Nigeria. Bantu languages predominate, with Chadic and Nilo-Saharan languages also spoken in some areas. Christianity, mixed with traditional beliefs in some places, is the predominant religion in Central Africa.

Central Africa is also home to the most terrible genocide of the late twentieth century, which took place in Rwanda in 1994, which played a part in and led to the Congo Wars in 1996 and 1998 (also known as the Great War of Africa) which officially ended in July 2003. The Great War of Africa was the deadliest war in modern African history, directly involving nine African nations, as well as about 20 armed groups. By 2008, the war and its aftermath had killed 5.4 million people, mostly from disease and starvation.

Rwanda

Rwanda's history is dominated by the events that took place in 1994 and their aftermath which continue to shape the future of the region. A coup in 1973, installed a President from the majority Hutu people and with the imposition of one party rule, the minority Tutsis were subject to serial abuse and many fled to neighboring countries including Uganda, where under the umbrella of the Rwandan Patriotic Front (RPF), the Tutsis fought back, unsuccessfully invading Rwanda in 1989, and again in 1990 with a Civil war the result. In 1993 the civil war ended with a peace accord granting increased rights to Tutsis at the cost of almost 1 million lives lost. With a shaky peace still in place, the Hutu Rwandan President Juvénal Habyarimana returned by plane from a regional summit in Tanzania, a surface-to-air missile hit his plane killing all on board over Rwanda's capital city of Kigali. Hutu extremists reacted angrily, taking over the government, they blamed the Tutsis for the assassination and began a slaughter that would be later called a genocide. Lasting 100 days, the Rwanda

genocide left approximately 800,000 Tutsi and Hutu sympathisers dead. The genocide was carried out by the Army for the Liberation of Rwanda, which was formed by the amalgamation of FAR (the armed forces of the Rwandan Hutu regime) and the civilian militia forces known as the Interhamwe. The Rwanda Genocide ended only when the RPF finally responded and took over the country.

Following the RPF's success, over a million Hutus, including most of those implicated in the genocide, fled to Zaire (now the Democratic Republic of the Congo), setting up camps of refugees in Eastern Congo near Goma and re-establishing the Interhamwe who began to work with the then Congolese government and agitating and destabilising the region. Rwandan forces, with support from Uganda, allied with the Congolese opposition led by Laurent Kabila, attacked in 1996, dispersing the Goma camps, and forcing the majority of Hutu exiles to return to Rwanda, while pushing the Interhamwe deeper into Congo and further from the Rwandan border.

Rwanda is led by President Paul Kagame, in office since 2000 and elected to a second 7 year term in 2010.

The Rwandan financial system remains relatively unsophisticated, although the number of electronic fund transfers and credit card transactions is rising. Money transfers by cell phone are becoming common. While the black market for smuggled goods is limited, the smuggling of tin, tantalum, tungsten, and gold from neighboring Democratic Republic of Congo generates funds which may be laundered through Rwanda's financial system. The scope of this smuggling is difficult to quantify.

Army for the Liberation of Rwanda (ALIR) (Hutu) - Rwanda / DRC

The Army for the Liberation of Rwanda (ALIR) was formed in 1994 from the amalgamation of FAR (the armed forces of the Rwandan Hutu regime) and the civilian militia force known as Interahamwe. These two groups were responsible for the genocide carried out against the Tutsi community in 1994 in which more than 500,000 men, women and children lost their lives. Many moderate Hutus also fell victim to this genocidal rampage. The merger of the two groups occurred as they were forced out of Rwanda into the Democratic Republic of Congo by the shift in power from the majority Hutu ethnic community to that of the Tutsis. Formulated with the objective of restoring Hutu control in Rwanda, the ALIR functions as the armed wing of the Party for the Liberation of Rwanda. It is also feared that the ALIR intends to complete the genocide of the smaller Tutsi community that it began in 1994.

The activities of the ALIR have not however been restricted to the Tutsi community; members of ALIR have also targeted foreign nationals from countries

believed to support the Tutsi government. For instance in 1999 ALIR militants captured and killed 8 foreign tourists visiting a game reserve in the Congo-Ugandan border area. The attack was allegedly in response to UK and US governmental support for the Tutsi regime. The ALIR also participated in the Congo Civil War, aligning itself with the Democratic Republic of Congo's government to help quell the uprising following the Rwandan government's declaration of support for the uprising. Consequently the Democratic Republic of Congo provided the ALIR with training camps and funding in exchange for its military aid. This allowed the ALIR to conduct operations in Rwanda alongside its Congolese campaign.

In 2001 the ALIR was replaced by the Democratic Front for the Liberation of Rwanda (FLDR), a group that has established links with other insurgent groups in Rwanda and continues to operate near the Rwandan border in the east of the Democratic Republic of Congo. In 2002, following the withdrawal of Rwandan troops from eastern Congo, the Democratic Republic of Congo ceased its financial support for the FLDR. The FLDR is believed still active.

Rwandan Patriotic Army (Tutsi) - Rwanda

The Rwandan Patriotic Army (RPA) is the military wing of the Tutsi political movement known as the Rwandan Patriotic Front (RPF). The group was founded in 1985 in Uganda and composed of exiled Rwandan Tutsis who had fled their homeland in order to escape the violence directed at their community by the Hutu ethnic tribe. In 1989 the RPA invaded Rwanda in an attempt to seize back power from the Hutu government, however the campaign was unsuccessful and the RPA retreated to Uganda.

In 1990 the RPA, having regrouped, renewed the invasion and crossed into Rwanda with approximately 10,000 soldiers under the command of Major General Rwigyema. With this move began a conflict that endured for three years, descending into a campaign based largely on guerrilla insurgency and widely held to have cost the lives of 800,000 people. In 1993 the Civil War ended with the signing of a power sharing agreement, however by 1994 the peace had been broken and the interim government initiated a campaign against Tutsis and moderate Hutus that has become known as the 1994 Rwandan Genocide. In response to this assault the RPA restarted its violent campaign against the Rwandan government and by July of 1994 had taken control of the entire country. Having seized power through the military efforts of the RPA the RPF swore in a transitional government. However this development did not spell the end of ethnic violence in Rwanda, with the RPA (now known as the Rwandan Defence Forces) exacting devastating retribution against the Hutu community. According to Amnesty International up to 200,000 lives were claimed in this ethnic violence.

Democratic Republic of the Congo

A former Belgian colony, known in 1907 as the Belgian Congo, independence was achieved in 1960, and it was renamed the Democratic Republic of the Congo. In 1965 a coup would install military leader Mobutu Sese Seko who renamed the country the Republic of Zaire ruling the country for more than 30 years, a rule noted for its brutality and corruption. With the end of the cold war a weak Mobutu government was being affected by events in neighbouring Rwanda. By 1996, the war and genocide in neighbouring Rwanda (see above) had spilled over to Zaire. Rwandan Hutu militia forces (Interahamwe), who fled Rwanda following the ascension of a Tutsi-led government, were using Hutu refugee camps in eastern Zaire as bases for incursions against Rwanda. Rwandan troops, Rwandan Patriotic Front (RPA) entered Zaire, and allied with Ugandan forces and the local armed opposition led by Laurent-Desire Kabila known as the Alliance of Democratic Forces for the Liberation of Congo-Zaire (AFDL), they attacked both the Interhamwe and the Mobutu regime. The Interhamwe fled deeper into the Congo and away from the Rwandan border region and the government forces were eventually defeated when in May 1997, Mobutu left the country, and Kabila became President.

This could have seen an end to the regional conflict with decisive victories both in Rwanda and Congo achieved by allies. However by 1998, the once time allies had become enemies, once Kabila ordered all foreign troops to leave the Congo. By 1999, the DRC was divided de facto into three segments, each controlled by the Congolese government, backed also by Angolan, Namibian and Zimbabwean troops and Ugandan backed troops and Rwandan backed troops with the parties controlling each segment but with a military deadlock between them. The breakthrough came in 2001 with the assassination of Laurent Kabila who whilst succeeded by his son, Joseph Kabila, who agreed to power sharing taking effect in 2003. Whilst the Country is much more stable, conflict still remains, particularly in Eastern Congo with Rwandan Tutsi supported groups such as M23 continuing.

Much of the fighting is thought to also involve control of the Congo's mineral wealth which is the mainstay of the economy. Mining is centered in Katanga province. Products include: copper, cobalt, zinc, manganese, uranium, cassiterite (tin ore), coal, gold, and silver. Diamonds are mined in Kasai. There are major deposits of petroleum offshore near the mouth of the Congo River. About 75% of the Congo is covered with forest containing ebony and teak as well as less valuable woods. Since 1994 diamonds have become the country's leading export following a decline in the production of copper (once the leading mineral product in terms of

value). The country produces much of the world's small industrial diamonds. Most economic activity in the DRC takes place in the informal sector, estimated to be up to ten times the size of the formal sector, with most transactions, even those of legitimate businesses, carried out in cash. Bribery and Corruption, customs and tax fraud, tax evasion, misappropriation of public funds, the sale of prohibited products and services, and illegal exploitation of minerals and other valuable materials are common. Casinos and smuggling of gold, diamonds, and weapons also are important sources of untracked money. Gold and diamonds are extensively mined in and routinely smuggled out of the DRC, and most of those cash transactions take place in US dollars. Due to its large geographic size, lack of a functional judicial system, and dominant informal sector, the DRC is particularly vulnerable to money laundering. The DRC is ranked 154 out of 175 in the 2013 Transparency International Corruption Perceptions Index. The DRC is subject to UN, US, and EU sanctions, including an arms embargo, and travel bans and asset freeze orders against members of militia and rebel groups. For more details see Part 1 Section 3 Money Laundering Laws and Regulations.

Republic of the Congo / Congo-Brazzaville

The original human settlers in the region were pygmies, followed in the 13th century by Bantu tribes from Nigeria and then followed by the Europeans in the 15th Century. The French dominated the region, occupying it and then making it part of French Equatorial Africa in 1910, which was established to bring together four territories: Gabon, Middle Congo (now the Republic of the Congo), Oubangui-Chari (now the Central African Republic) and Chad, with the Central authority based in Brazzaville, now the capital of the Congo. Under France's Fourth Republic (1946–58), the federation was represented in the French parliament. When the territories voted in the September 1958 referendum to become autonomous within the French Community, the federation was dissolved. In 1959 the new republics formed an interim association called the Union of Central African Republics, before becoming fully independent in August 1960. A quarter century of experimentation with Marxism was abandoned in 1990 and a democratically elected government took office in 1992. A brief civil war in 1997 restored former Marxist President Denis Sassou-Nguesso, leading to unrest until a final peace accord in 2003, though the calm is uneasy. The Republic of Congo is one of Africa's largest petroleum producers. The Republic of the Congo is not a major regional financial center nor is it a major narcotics destination or source country, although the port city of Pointe Noire is frequently utilised as a transit point for narcotics moving north to Europe. Most financial crimes involve domestic corruption and embezzlement. The ROC's

economy is heavily cash dependent, relying very little on electronic transfers and cheques. Laundering money through investment in real estate is reportedly a growing problem.

Gabon

Gabon has a similar history to the Congo above and like its former French Equatorial African brethren it gained its independence in 1960. Since that time Gabon has had two long serving president dictators. The first was Leon M'ba and the second was Omar Bongo, who would rule the country for more than 30 years until his death in 2009 ruling as a corrupt dictator for most of this period. He was succeeded by his son, Ali Bongo Ondimba. Gabon suffers from porous borders; and smuggling, which is facilitated by organised criminal groups, is widespread. Despite reform efforts, systemic corruption still exists, with embezzlement of state funds, including by politically exposed persons (PEPs), giving rise to money laundering.

Central African Republic

From the 16th to 19th century, the people of this region were ravaged by slave traders. The French occupied the region in 1894. As the colony of Ubangi-Shari, what is now the Central African Republic was united with Chad in 1905. In 1910 it was joined with Gabon and the Middle Congo to become French Equatorial Africa and gained its independence after its dissolution. After many governments of different stripes, many of whom can be considered corrupt, the country is today one of the world's poorest and unstable. Following a recent coup, Michel Djotodia has become President in 2013. The economy is almost entirely cash-based and corruption is widespread. Smuggling of contraband including diamonds and weapons is believed to occur across the unsecured border areas with Chad and Sudan, while undocumented trade across the river with the Democratic Republic of the Congo involves primarily domestic or agricultural goods.

Chad

Chad, part of French Equatorial Africa until 1960, it has since endured three decades of civil warfare, as well as invasions by Libya, before peace was finally restored in 1990. The government eventually drafted a democratic constitution and held flawed presidential elections in 1996 and 2001. In 1998, a rebellion broke out in northern Chad, which has sporadically flared up despite several peace agreements between the government and the insurgents. In 2005, new rebel groups emerged in western Sudan and made probing attacks into eastern Chad despite signing peace agreements in 2006 and 2007. President Idriss Deby was reelected again in 2011

to his fourth term, with power in the hands of an ethnic minority. Contraband and smuggling vary by region in Chad. Along the southern and western borders, the contraband goods market consists largely of foodstuffs, cigarettes, fuel, and household items smuggled to avoid import duties. Across Chad's northern desert, which is sparsely populated and transected by Sahelian trade routes, smuggled items include drugs and weapons. Some of these items transit Chad rather than remain in the domestic market. Chad is rated 163 out of 175 in the 2013 Transparency International Corruption Perceptions Index.

Burundi

Burundi is a landlocked country in the Great Lakes region of Eastern Africa, bordered by Rwanda to the north, Tanzania to the east and south and the Democratic Republic of the Congo to the west. Burundi is one of the five poorest countries in the world. The Twa, Hutu and Tutsi peoples have lived in Burundi for at least five hundred years and, for over two hundred years, Burundi was ruled as a kingdom. Burundi's first democratically elected president was assassinated in October 1993 after only 100 days in office, triggering widespread ethnic violence between Hutu and Tutsi factions. More than 200,000 Burundians perished during the conflict that spanned almost a dozen years. In 2005, and elected a majority Hutu government in 2005. The government of President Pierre Nkurunziza who was re-elected in 2010, continues to face many political and economic challenges, with corruption endemic, according to Transparency International, Burundi is ranked 157 out of 175 in its 2013 Corruption Perceptions Index.

Cameroon

French Cameroon became independent in 1960 as the Republic of Cameroon. The following year the southern portion of neighboring British Cameroon agreed to merge to form what is Cameroon today. The country has been one of the more stable in the region, albeit with slow movement toward democratic reform. Power remains firmly in the hands of President Paul Biya. Instability in neighbouring countries and the use of a common currency have resulted in Cameroon being used as a conduit to move funds from those countries to Europe. Terrorist activity in neighbouring countries, illicit wildlife trafficking and maritime piracy present vulnerabilities and their proceeds may facilitate the movement and activities of terrorists and drug trafficking organisations. Its economy is heavily cash dependent. Trade-based money laundering is rampant. Cameroon is particularly vulnerable to the abuse of cross-border bulk currency movements and exploitation by companies transferring money internationally. Most foreign currency transactions are in euros or dollars.

São Tomé and Príncipe

São Tomé and Príncipe consists of two archipelagos around the two main islands: São Tomé and Príncipe, off the northwestern coast of Gabon, being islands that are part of an extinct volcanic mountain range. São Tomé, the sizable southern island, is situated just north of the equator. With an estimated population of 172,000, São Tomé and Príncipe is the second-smallest African country (Seychelles is the smallest African country). Originally claimed by Portugal in the late 15th century, independence was only achieved in 1975. A new government of Prime Minister Gabriel Arcanjo Ferreira Da Costa took office in 2012. The recent discovery of oil in the Gulf of Guinea promises to attract increased attention to the small island nation.

Equatorial Guinea

A former Spanish colony, Equatorial Guinea is a small country in West Africa which gained its independence in 1968. It is today sub-Saharan Africa's third biggest oil producer. Current President Teodoro Obiang Nguema Mbاسogo, came to power in a coup in 1979, following the reign of terror if his predecessor Francisco Macias Nguema.

According to Human Rights Watch, the "dictatorship under President Obiang has used an oil boom to entrench and enrich itself further at the expense of the country's people". Transparency International has put Equatorial Guinea in the top 12 of its list of most corrupt states raking it 163 out of 176. Resisting calls for more transparency, President Obiang has for long held that oil revenues are a state secret. A 2004 US Senate investigation into the activities of US Bank, Riggs Bank found that President Obiang's family had received huge payments from US oil companies including from Exxon Mobil. Global Witness has been lobbying governments to act in particular against the President and his son, Teodoro Obiang, on corruption grounds, though as Obiang's son is a government minister, both enjoy some sovereign immunity protections. For more details see Part 2 Section 7 below. Equatorial Guinea also hit the headlines in 2004 when the start of an attempted coup was intercepted in Zimbabwe just before they were about to depart to overthrow President Obiang. For more details see Part 2 Section 7 Simon Mann below. Beyond concerns over corruption, human trafficking concerns are the most serious. Equatorial Guinea is a source and destination country for women and children subjected to forced labour and sexual exploitation. Women and children have been trafficked from Cameroon, Benin and other neighboring countries for work as domestic servants, and to for forced labour or prostitution; Equatorial Guinean girls may be encouraged by their parents to engage in the sex trade in urban centers to receive groceries, gifts, housing, and money.

Southern Africa

Southern Africa comprises Botswana, Lesotho, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe. The region shares many of the same experiences of other regions in sub-Saharan Africa, with settlements of Bantu-speaking peoples moving south of the Limpopo River by the 4th or 5th century BC. They also shared similar colonial experiences, with European colonial rule being firmly established in the Nineteenth Century during the so called scramble for Africa. However whilst much of Africa gained independence in the 1960s, Independence took much longer in Southern Africa, where European settler colonies tended to be more entrenched and lasted longer than in the rest of Africa. European settler colonies existed in South Africa, Zimbabwe, Namibia, Angola, and Mozambique, and consequently, these African countries were among the last to achieve independence. For example Angola and Mozambique in the 1970s; Zimbabwe in 1980; and Namibia in 1990.

South Africa became a minority-led republic in 1961 and achieved majority-rule in 1994). In many cases, the end of white minority rule required armed struggle on the part of Africans in order to achieve independence.

After independence, the countries that fought wars of independence implemented largely socialist or redistributionist policies, which made them targets of external interference and destabilization. Angola and Mozambique experienced punishing retribution from South Africa and the US for turning to the Eastern bloc for support. Moreover, whether a country committed itself to socialist policies or not, they all found themselves confronting the South African apartheid state, which was determined to maintain economic and military authority in the region at any cost. Finally, the countries of the region have a long history of economic interdependence.

Because of South Africa's dominance, neighboring countries were dependent upon South Africa for trade, transportation (especially the land-locked countries), and communication. In addition, migrants from neighboring Botswana, Mozambique, Swaziland, and Lesotho historically journeyed to South Africa to work in that country's agricultural, mining, and manufacturing industries. The earnings that migrants made became crucial to the survival of families left back home. Eventually, Southern African countries created regional integration schemes, among them the Southern African Customs Union and the Southern African Development Community, to improve their economic fortunes and develop cooperative security regimes.

South Africa

Dutch traders landed at the southern tip of modern day South Africa in 1652 and established a stopover point on the spice route between the Netherlands and the Far East, founding the city of Cape Town. After the British seized the Cape of Good Hope area in 1806, many of the Dutch settlers (the Boers) trekked north to found their own republics. The discovery of diamonds (1867) and gold (1886) spurred wealth and immigration and intensified the subjugation of the native inhabitants. The Boers resisted British encroachments but were defeated in the Boer War (1899-1902); however, the British and the Afrikaners, as the Boers became known, ruled together beginning in 1910 under the Union of South Africa, which became a republic in 1961 after a whites-only referendum. In 1948, the National Party was voted into power and instituted a policy of apartheid, the separate development of the races, which favoured the white minority at the expense of the black majority.

The African National Congress (ANC) led the opposition to apartheid and many top ANC leaders, such as Nelson Mandela, who recently passed away and who spent decades in South Africa's prisons. Internal protests and insurgency, as well as boycotts by some Western nations and institutions, led to the regime's eventual willingness to negotiate a peaceful transition to majority rule. The first multi-racial elections in 1994 brought an end to apartheid and ushered in majority rule under an ANC-led government, under President Mandela. Current President and ANC leader is Jacob Zuma, who won general elections in 2009.

South Africa, as its name suggests is located at the southern tip of Africa and is the 25th-largest country in the world by land area, and with close to 53 million people, it is the world's 24th-most populous nation. South Africa is a multiethnic society encompassing a wide variety of cultures, languages, and religions, including Europeans and Asians but still dominated with 80% of black African ancestry.

Its economy is the largest and most developed in Africa and the 28th-largest in the world, although poverty and inequality remain widespread, with about a quarter of the population unemployed and living on less than US\$1.25 a day. South Africa though is plagued by serious corruption concerns with Transparency International ranking the country 69 out of 176 in its 2012 Corruption Perceptions Index and a high crime rate. A survey for the period 1998–2000 compiled by the UN Office on Drugs and Crime ranked South Africa second for assault and murder (by all means) per capita and first for rapes per capita in a data set of 60 countries. Total crime per capita ranked South Africa as 10th overall. Whilst around 50 people are murdered in South Africa each day, the murder rate has reduced by 50%. In the period 1994 to 2009. The annual crime statistics

released in 2011 show a continuing downward trend, except for rape, which went up by 2.1%.

The country has one of the highest rates of rape in the world, with some 65,000 rapes and other sexual assaults reported for the year ending in March 2012, or 127.6 per 100,000 people in the country. The incidence of rape has led to the country being referred to as the "rape capital of the world". South Africa has amongst the highest incidences of child and baby rape in the world. If the rapist is convicted, his prison time would be around 2 years.

South Africa also has a high record of car hijackings when compared with other industrialised countries. Certain high-risk areas are marked with road signs indicating a high incidence of car hijackings within the locality. Crime against commercial white farmers is also particularly high, and the issue continues to attract significant media attention. As far as white collar fraud is concerned, according to PricewaterhouseCoopers' fourth biennial Global Economic Crime Survey in 2005, 83% of South African companies reported being affected by white collar crime in 2005, whilst 72% of South African companies reported being affected in 2007.

South Africa's position as the major financial center in the region, its sophisticated banking and financial sector, and its large, cash-based market make it vulnerable to exploitation by transnational and domestic crime syndicates. The largest source of laundered funds in the country is proceeds from the narcotics trade. Fraud (advance fee scams, beneficiary maintenance fraud, and deposit refund scams), theft, racketeering, corruption, currency speculation, credit card skimming, poaching, theft of precious metals and minerals, human trafficking, stolen cars, and smuggling of goods are also sources of laundered funds. Many criminal organisations also are involved in legitimate business operations.

In addition to criminal activity by South African nationals, observers note criminal activity by Nigerian, Pakistani, Andean, and Indian drug traffickers; Chinese triads; Taiwanese groups; Bulgarian credit card skimmers; Lebanese trading syndicates; and the Russian mafia. Investment clubs, known as stokvels, have been used as cover for pyramid schemes. In some instances, nominee structures have been exploited by criminals who intend to launder illicit funds by mixing them with legitimate assets held on someone else's behalf. There is a significant black market for smuggled and stolen goods. South Africa is a transshipment center for heroin, hashish, and cocaine, as well as a major cultivator of marijuana. It is also the world's largest market for illicit methaqualone, usually imported illegally from India through various east African countries, but increasingly producing its own synthetic drugs for domestic consumption. South Africa is also home to a number of domestic organised criminal gangs, including the [People Against Gangsterism and Drugs](#) and the [Numbers Gang](#).

People Against Gangsterism and Drugs - South Africa

People Against Gangsterism and Drugs (PAGAD) was a muslim vigilante group formed in 1996 in the Cape Flats area of Cape Town, South Africa, emanating out of Qibla a small South African Islamic extremist group led by Achmad Cassiem, who was inspired by Iran's Ayatollah Khomeini. Cassiem founded Qibla in the 1980s, seeking to establish an Islamic state in South Africa. PAGAD began in 1996 as a community anticrime group fighting drug lords in Cape Town's Cape Flats section.

PAGAD now shares Qibla's anti-Western stance as well as some members and leadership. Though each group is distinct, the media often treat them as one. Both use front names including Muslims Against Global Oppression (MAGO) and Muslims Against Illegitimate Leaders (MAIL) when launching anti-Western campaigns.

PAGAD was originally initiated by a handful of muslim neighbourhood watch members from a few Cape Town townships who decided to organise public demonstrations to pressure the government to fight the illegal drug trade and gangsterism that was affecting their communities. However, PAGAD increasingly took matters into their own hands, believing the police were not taking enough action against gangs. Initially the community and police were hesitant to act against PAGAD activities, recognising the need for community action against crime in the gang-ridden communities of the Cape Flats. Notorious gangsters were initially asked by PAGAD members to stop their criminal activities or be subject to 'popular justice'. For those that refused or ignored warnings, PAGAD members would set fire to drug dealers houses and kill gangsters. PAGAD's campaign came to prominence in 1996 when a local gang leader was beaten and burnt to death by a mob during a march to his home. South Africa's police quickly came to regard PAGAD as part of the problem, rather than a partner in the fight against crime and they were eventually designated a terrorist organisation by the South African government.

The threat of growing vigilantism in 2000 led the Western Cape provincial government to declare a 'war on gangs' that became a key priority of the ANC government at the time. Although PAGAD's leadership denied involvement, they were believed to be responsible for killing a large number of gang leaders, and also for a bout of urban terrorism particularly bombings in Cape Town, targeting gang leaders, bombing targets including South African authorities, moderate Muslims, synagogues, gay nightclubs, tourist attractions, and Western-associated restaurants, including in 1998 the Cape Town Planet Hollywood, leaving 2 dead and 26 injured allegedly in response to US strikes against Sudan. Today, PAGAD maintains a small and less visible presence in the Cape Town Muslim community.

Numbers Gang - South Africa

The Numbers Gang is an umbrella term encompassing South Africa's three most prominent prison gangs, 28s, 27s and 26s. The origin of these groups can be traced back to the late nineteenth century when sects were established amongst working men residing in all male compounds at Witwatersrand mine near Johannesburg. These gangs were therefore originally formed outside prisons, however during the apartheid system, when imprisonment became a commonplace experience for black South Africans who failed to carry their identification passes, prisons soon became a convenient meeting place and organisational hub. As a result the Numbers gang is now firmly entrenched within South African Prisons.

The organisational structure of the Numbers gang is relatively sophisticated, emulating that of military institutions in its strict hierarchical order. Rigid discipline is also enforced in similar military fashion, and much like the armed forces ranks are transferable, both between prisons and between the internal world of the prison and the external free community. Members are even punished for transgressions by an internal tribunal process. The distinct subsections within the numbers gang, known as 28s, 27s and 26s, perform specific roles within the organisation. Members of the 28s are regarded as the most senior echelon of the group, providing its leadership and allowing themselves to possess 'wifes' (a jail term for a male partner). 27s is responsible for the enforcement of rulings made by the other two groups, while the final third of the tripartite system, 26s, is assigned the task of yielding revenue for the group. Members of this rank specialise in fraud, theft and the trade of illegal substances.

Angola

Angola achieved its independence from Portugal in 1975, but then suffered a 27-year civil war which only ended in 2002. Fighting between the Popular Movement for the Liberation of Angola (MPLA), led by Jose Eduardo Dos Santos, who led the government and the National Union for the Total Independence of Angola (UNITA), led by Jonas Savimbi, cost up to 1.5 million lives, with another 4 million people displaced. Savimbi's death in 2002 ended UNITA's insurgency and cemented the MPLA's hold on power. President Dos Santos was re-elected as President once again in 2012.

Whilst Angola does not produce large quantities of drugs it is nevertheless a transit point for drug trafficking, particularly for drugs brought in from Brazil and South America destined for Europe. Increasingly, Angola is becoming a destination point as well with a growing market for illicit drugs. Angola's borders are porous and vulnerable to general smuggling and trafficking in small arms, diamonds, humans, and motor vehicles. Angola has a high rate of U.S. dollar cash flow.

The laundering of funds derived from widespread corruption is also a concern. Corruption remains a serious problem in Angola with according to Transparency International, Angola ranking 153 out of 175 countries in its 2013 Corruptions Perceptions Index.

National Union for the Total Independence of Angola (UNITA) - Angola

The National Union for the Total Independence of Angola (UNITA) was a rebel group originally formed in 1966 to fight for Angolan independence from Portugal. However following the rise to power in 1975 of the Movimento de Libertao de Angola (MPLA) in place of the Portuguese, UNITA's allegiances were drastically reversed; the group accepted the financial support of Portugal and other Western nations in order to violently oppose the new government of Angola. A great deal of this Western support was derived from anti-Soviet sentiment and the identification of the new Marxist-Leninist Angolan government as a proxy of the Soviet state. The conflict between the MPLA and UNITA soon progressed into the Angolan Civil War, a struggle perceived as highly significant in the geopolitical balance of power during the Cold War. Though broken up by short periods of peace, the conflict endured for 27 years and is reported to have claimed somewhere in the region of 500,000 lives.

During this bloody war UNITA perpetrated attacks against civilians that appeared to demonstrate little more than wanton violence and led to the group's characterization as a terrorist group. For instance in 2001 UNITA reportedly bombed the Angolan civilian railway, resulting in the deaths of more than 150 civilians.⁸ In 2002 UNITA forces admitted defeat and the Civil War came to an end. Since then UNITA has participated peacefully in the electoral process, standing in the 2008 elections and winning 16 seats. However UNITA represents a fitting reminder of the dangers inherent in attempting to influence the domestic politics of a nation in the interests of international politics. A poignant commentary on the use of such politically motivated foreign aid in local conflicts is provided by Guardian journalist Victoria Brittain, who, speaking of UNITA's leader Jonas Savimbi notes that "The CIA embraced Savimbi as warmly, and as unthinkingly, as it did bin Laden. Both were dependable anti-communists. Both became terrorists."

Lesotho

Formerly Basutoland, the country was renamed the Kingdom of Lesotho on its independence from the UK in 1966. In 1998, violent protests and a military mutiny following a contentious election prompted a brief but bloody intervention by South African and Botswana military forces. After continued instability, finally elections in 2012 produced a representative coalition government under Prime Minister Motsoahae Thomas Thabane.

While there is not a significant black market for smuggled goods in the country, undeclared and undeclared items pass between Lesotho and South Africa daily. The vast majority of smuggling is low level and committed by individuals. Smugglers commonly bring undeclared consumer goods or occasionally larger items like automobiles from South Africa into Lesotho. There is some evidence of more illicit activity as small arms are smuggled across Lesotho's porous border, often in exchange for Lesotho-grown marijuana.

Namibia

Namibia, formerly the German colony of South-West Africa, was annexed by South Africa after World War II. In 1966 the Marxist South-West Africa People's Organisation (SWAPO) guerrilla group launched a war of independence for the area that became Namibia, but it was not until 1988 that South Africa agreed to end its interest and usher in Namibian independence in 1990. When Namibia gained its independence SWAPO became the dominant political party, with its head, Sam Nujoma, elected as Namibia's first President. Nujoma had the constitution changed so he could run for a third term in 1999, but in 2004 he was replaced as the SWAPO presidential candidate by Hifikepunye Pohamba, who has been described as Nujoma's hand-picked successor. SWAPO continues to dominate Namibian politics, continuing still as the governing party winning 75.25% of the popular vote and 54 out of 72 seats in the parliamentary election held in November 2009.

Sources of money laundering in Namibia are related to both regional and domestic criminal activities. Falsification or misuse of identity documents, customs violations, trafficking of precious metals and gems, trafficking in illegal drugs, and stolen vehicles - mostly from South Africa, are regional problems that affect Namibia. Organised crime groups involved in smuggling activities generally use Namibia as a transit point, particularly for goods destined for Angola. Domestically, real estate as well as minerals and gems are suspected of being used as vehicles for money laundering. Namibian authorities believe the proceeds of these activities are laundered through Namibian financial institutions, but on a small scale. The organised fencing of stolen goods, not just vehicles, is also a problem in Namibia. Namibia is predominantly a country of origin and destination for children and, to a lesser extent, women subjected to forced labour and sex trafficking.

Mozambique

Almost five centuries as a Portuguese colony came to a close with independence in 1975. Large-scale emigration, economic dependence on South Africa, a severe drought and a prolonged civil war hindered the country's development until mid-1990s. The ruling Front for the Liberation of Mozambique (Frelimo) party formally

abandoned Marxism in 1989, and a new constitution the following year provided for multiparty elections and a free market economy. A UN-negotiated peace agreement between Frelimo and rebel Mozambique National Resistance Movement (Renamo) forces ended the fighting in 1992. In December 2004, Mozambique underwent a delicate transition as Joaquim Chissano stepped down after 18 years in office. His elected successor, Armando Emilio Fuebuza, was reelected to a second term in October 2009. However, the elections were flawed by voter fraud, questionable disqualification of candidates, and Frelimo use of government resources during the campaign. As a result, Freedom House removed Mozambique from its list of electoral democracies.

Mozambique is a transit point for South Asian hashish and heroin, and South American cocaine probably destined for the European and South African markets. Money laundering is linked principally to customs fraud and drug trafficking. Local organised criminal groups control narcotics trafficking operations in the country and are thought to involve networks with links to Pakistani and Indian nationals and immigrants. Authorities believe the proceeds from these illicit activities have helped finance commercial real estate developments, particularly in the capital. While money laundering in the banking sector is considered to be a serious problem, foreign currency exchange houses, cash couriers, and the hawala remittance system play more significant roles in financial crimes and money laundering. Black markets for smuggled goods and informal financial services are widespread, dwarfing the formal retail and banking sectors in most parts of the country. The laundering of funds derived from widespread corruption is also a concern. Corruption remains a serious concern in Mozambique with, according to Transparency International in 2013 Mozambique ranking 119 out of 175 in its 2013 Corruptions Perception Index.

Mozambique National Resistance Movement (RENAMO) - Mozambique

The Mozambican National Resistance (Resistencia Nacional Mocambicana -- Renamo) was formed in 1976 in response to the ascension to power of the Communist group known as the Front for the Liberation of Mozambique (Frelimo) in 1975. The foundation of the Renamo was in large part orchestrated by Rhodesia's white minority government, which feared that Frelimo would encourage resistance to white rule in Rhodesia and may go so far as to provide support for rebels attempting to seize power. To pre-empt any possible disruption to their status-quo, the Rhodesian government founded Renamo to actively combat Frelimo forces based in Mozambique. The organisation was made up of a range of groups opposed to the new Frelimo government; disillusioned former Frelimo members, opponents of the Marxist-Leninist Frelimo government, and soldiers of the former Portuguese colonial army all joined forces to combat the new rulers of Mozambique.

This armed resistance posed by Renamo to the new

government of Mozambique resulted in the initiation of the Mozambican Civil War in 1977, a conflict estimated to have cost around 1 million lives and whose legacy is still felt today with undetonated landmines continuing to cause casualties. In 1980, with the collapse of minority white rule in Rhodesia and the emergence of Zimbabwe in its place, the funding of Renamo was taken up by South Africa as the last bastion of white rule in Africa. As part of its plan to maintain a system of Apartheid the South African government set about a policy of destabilizing its bordering African nations, consequently directing Renamo operations towards the destruction of trade and communications infrastructure in both Mozambique and the newly formed Zimbabwe. This South African sponsorship came to an end however following an accord between the governments of South Africa and Mozambique. In this 1984 concord it was agreed that Mozambique would cease its support for the ANC in South Africa, in return for the retraction of South African support for Renamo operations in Mozambique. Consequently the level of state support on which Renamo could rely was greatly reduced.

Nonetheless Renamo operations continued throughout the 1980s, until the Mozambique Civil War finally drew to a close in 1992. On 4 October 1992 the opposing Frelimo and Renamo forces signed an official peace agreement, after which Renamo began its integration back into Mozambique society and politics. Many of the Renamo forces were also assimilated into the Mozambique armed forces and by 1994 Renamo had stood as a political party in democratic elections. Renamo, while never officially designated a terrorist group, is no longer considered to be a militant group. Indeed today Renamo is Mozambique's largest opposition party, receiving 29.7% of the popular vote in the 2004 general elections, though tensions remain with Frelimo dominating the country.

Botswana

Formerly the British protectorate of Bechuanaland, Botswana adopted its new name upon gaining independence in 1966. More than four decades of uninterrupted civilian leadership, progressive social policies, and significant capital investment have created one of the most stable economies in Africa. Mineral extraction, principally diamond mining, with Botswana becoming the world's largest diamond producer dominates economic activity. The stringent institutional framework for the mining and processing of diamonds affords little opportunity for organised diamond smuggling.

Smuggling that may occur is not believed to be linked to terrorist finance or the laundering of criminal proceeds. Botswana enjoys a low level of corruption compared to other African states. Botswana though is a cash-based society and the presence of organised criminal groups is growing.

There has been an increase in the amount and frequency of major fraud committed against large organisations, e.g., banks or government departments, typically with the collusion of an employee. Botswana has established an International Financial Service Center which authorizes entities to provide financial services, covering funds management, banking services, international insurance and financial intermediary services.

Swaziland

Autonomy for the Swazis of southern Africa was guaranteed by the British in the late 19th century. Independence was granted in 1968. Student and labour unrest during the 1990s pressured King Mswati III, Africa's last absolute monarch, to grudgingly allow political reform and greater democracy, although he has backslid on these promises in recent years.

There is a significant black market for smuggled goods such as cigarettes, liquor, pirated radio cassettes, videocassettes, and DVDs transited among Mozambique, South Africa and Swaziland. There is a general belief that trade-based money laundering exists in Swaziland. Proceeds generated through corruption are a major concern, as is human trafficking. Swazi officials believe the Kingdom to be at little risk of terrorist financing.

Zimbabwe

The UK annexed Southern Rhodesia from the [British] South Africa Company in 1923. A 1961 constitution was formulated that favored whites in power. In 1965 the government unilaterally declared its independence, but the UK did not recognise the act and demanded more complete voting rights for the black African majority in the country (then called Rhodesia). UN sanctions and a guerrilla uprising finally led to free elections in 1979 and independence (as Zimbabwe) in 1980. Robert Mugabe, the nation's first prime minister, has been the country's only ruler (as president since 1987) and has dominated the country's political system since independence. His chaotic land redistribution campaign, which began in 2000, caused an exodus of white farmers, crippled the economy, and ushered in widespread shortages of basic commodities. Ignoring international condemnation, Mugabe rigged the 2002 presidential election to ensure his reelection and he remains in power after being re elected again in 2013.

Zimbabwe is a state that has undergone traumatic economic and social transition since the 1980s providing opportunities for organised criminal groups; senior state bureaucrats and entrepreneurs from the private sector, to exploit weaknesses and opportunities.

Prior to the July 2013 elections in Zimbabwe, Global Witness, a pressure group that campaigns against the corruption so often involved in the exploitation of a

country's natural resources, asked the South African Development Community (SADC) to fully investigate claims that Robert Mugabe's ZANU PF party was attempting to rig the country's elections. They said there was strong evidence that ZANU PF had acquired large amounts of money from the country's diamond mines suggesting that the electoral roll had been 'doctored'. The opposition group Movement for Democratic Change (MDC) said it has serious concerns that diamond money was now a source of "off-budget revenue for ZANU-PF. Other observers have noted that the Zimbabwe secret police (CIO) has received a donation of US\$100mio from Sam Pa, a Hong Kong based businessman, in exchange for diamonds and access to other business opportunities.

In another case reported in the 'Zimbabwe Independent' the Registrar General of Zimbabwe refused to explain why his department had paid over US\$10mio to an Israeli security firm, Nikuv International, which dealt with voter rolls and election counting. According to the newspaper the recent elections were widely seen as a "made in Israel landslide". Diamonds came up again and again and help to illustrate the current phenomena of a country which has seen since its independence, economic collapse, hyperinflation and the outward migration of millions of its brightest and best. By any criteria Zimbabwe is an authoritarian state, functioning primarily, on tribal cronyism.

Organised Crime in the sense of the presence of transnational gangs has not been detected but there are organised criminal networks which have succeeded in establishing a common criminal market for illicit goods that covers the entire Southern African sub-region. These are loose confederations not socio-ethnic –criminal groupings such as the Mafia. The main kinds of non-state organised criminal activities are armed robberies, theft of motor vehicles, extortion rackets and the smuggling of diamonds and gold. Drugs are not seen as a large problem although Zimbabwe is increasingly seen as a transhipment point into South Africa.

It is said that organised crime constitutes a serious threat to societies, because it undermines good governance and transparent economic activities, becoming closely associated with corruption and violence. In this respect crime in Zimbabwe is merely an adjunct to pre-existing corruption where the ruling elite itself can penetrate and corrupt public and private organisations with the mirror activities of organised crime penetrating into both the formal business sector and government structures.

According to Transparency International in 2013 the country is amongst those most corrupt with a score of 157 out of 175. Zimbabwe is also ranked close to last in other categories such as GDP or Health. In the case of the latter, male life expectancy at 37 years, with 34 for women. Within the public sector everyday corruption is rife but it is the corruption at the political level which embraces both public and private economic activity that

sets the tone. Indeed many commercial organisations are connected with members of the Government and the Armed Forces.

Organised crime was given a boost when the Zimbabwean government intervened in the conflict in the Democratic Republic of Congo creating opportunities to exploit the resources of that country. Joint venture partnerships, involving participation of state functionaries in private enterprise and often involving partners with strong foreign links are not uncommon in Zimbabwe as is the use of state bureaucrats to protect them from competitive tender processes. The ZANU-PF also retains control of the country's enormously valuable natural resources. The South African, Chinese, and Russian state-owned or government-linked corporations have obtained valuable mineral concessions in platinum, diamonds, gold, chrome, and nickel. Some of the profits from those mining operations are channelled to the ZANU-PF, which uses the money to buy the loyalty of the police and military. In 2011 Robert Mugabe threatened to quit the Kimberley Process the body that seeks to prevent diamonds from funding conflicts. In the event the Kimberley Process is now seen by many to be seriously compromised and weakened. The US, Canada, Australia, and the EU have imposed targeted financial sanctions and travel restrictions on political leaders and a limited number of companies and state-owned enterprises believed to have been complicit in human rights abuses and undermining institutions and processes in Zimbabwe. For more details see Part 1, Section 3, Sanctions and Embargoes above.

Zambia

Zambia, formerly Northern Rhodesia achieved its independence and acquired its new name in 1964. Elections in 1991 brought an end to one-party rule, but subsequent votes were marked by problems which led to the election of Levy Mwanawasa, who was succeeded by his vice president, in 2008 by Rupiah Banda and since in 2011 by Michael Sata.

The Zambia is a transhipment point for moderate amounts of meths and small amounts of heroin, and cocaine bound for southern Africa and Europe. The proceeds of drug transactions and money derived from public corruption are the major sources of laundered funds. Human trafficking is also a problem.

Banks, real estate agents, insurance companies, casinos, and law firms are the institutions most commonly used to launder money. Money launderers in Zambia have used structuring, currency exchanges, monetary instruments, gambling, under-valuing assets, and front businesses to launder their proceeds. Other means include securities, debit/credit cards, bulk cash smuggling, wire transfers, and false currency reporting. Further, criminals use their proceeds to purchase luxury goods such as vehicles and real estate.

Middle East

The history of the Middle East dates back to ancient times, and throughout its history, the Middle East has been a major centre of world affairs, being the birthplace of 3 of the World's most important religions, Judaism, Christianity, and Islam as well as scores of others including the less common Bahá'í faith, Mandaeism, Druze faith and others. The largest countries by population are Egypt, Iran, Turkey, Iraq, Saudi Arabia, Yemen and Syria.

The modern Middle East began after World War I, when the Ottoman Empire was defeated by the British Empire and their allies and so the Middle East became partitioned into a number of separate nations, initially under British and French Mandates. Other defining events in this transformation included the establishment of Israel in 1947.

During the Cold War, NATO and the US on one side, and the Soviet Union and Warsaw Pact on the other competed to influence regional allies, particularly as the region contained two thirds of the world's oil reserves.

Whilst the term the "Middle East" had been used, it wasn't until World War 2 when it became customary to refer to the area we now know as the Middle East by this term, in fact up until this time, it was customary to refer to areas centred around Turkey and the eastern shore of the Mediterranean as the "Near East", while the "Far East" centred on China, and the Middle East then meant the area in between. Once the British established their Middle East Command and based it in Cairo, the term "Middle East" gained broader usage and acceptance.

The region has suffered numerous wars and conflicts and remains a region where tensions within the region have dominated political and world affairs and unfortunately continues to do so, with terrorism ever present and religious and nationalist tensions regularly making headlines. The emergence of Israel as an Independent State in 1947 led to one of the worlds most enduring conflicts, that between Israel and the Palestinian's and by extension with at times much of the Arab World. The rise of Islamic Groups, to increasing tension between some extreme groups and more secular regimes and conflicts between the two branches of Islam, Shia and Sunni and with other religious orders, including Jewish and Christian have also formed part of the narrative surrounding the development of the Middle East and elsewhere over the last 6 decades.

Today, there is much concern over the pursuit by some of Islamic Jihad. According to some, and clearly revealed by Ayatollah Khomeini at the time of the Iranian Revolution, a proper reading of the Quran and an understanding of history led to the conclusion that Palestine is the focus of the religio-historical confrontation between the Muslims and their eternal enemies, the Jews (and Christians). The Muslims represent the forces of truth while the Jews (and Christians) embody the forces of apostasy. In the context, the Palestinian problem can be viewed as the core of a Western offensive that began with the early Crusades and then Napoleon's invasion of Egypt in 1798 and reached its climax in 1918 with the disintegration of the Ottoman Empire, which had symbolized Islamic unity. According to this view, Palestine was always the focus of Western imperialist designs and was meant to serve as a launch pad to take over other Muslim territories. Inasmuch as the Jewish presence in Palestine symbolizes Muslim inferiority in the modern age, commitment to Palestine cannot be framed in the narrow confines of Palestinian nationalism. Instead, it is an essentially Islamic issue and is the key to unlock the liberation and unification of the Islamic nation. The jihad in Palestine entails a commitment to two inter-related goals: the liberation of Palestine and pan-Islamic revival. Jihad is the only way to liberate Palestine argue terrorists, since Muslim victory and the elimination of Israel are foreordained by God's words in the Quran.

Israel/Palestine

The Holy Land changed hands many times through history, from the Canaanites to the Israelites, Babylonians, Romans, Crusaders, Arabs, Ottoman Turks, British, but the modern phase of the conflict began in the late 1800s, when the Zionism movement grew as a result of anti-Semitism in Europe, concluding that the best solution would be the mass exodus of Jews to a state they could call their own. By 1917, Jews comprised less than 10% of the population of Palestine and lived in relative peace among their Muslim neighbors. But as waves of Jews began to immigrate to Palestine from Europe, many of them desperately fleeing Nazi persecution, tensions rose. Between 1936 and 1939, Palestinians organised civil and armed resistance against British overlords and European Jews. When the uprising was crushed, Palestinians were largely stripped of their arms and leaders, and the Jewish and Palestinian populations became further isolated and alienated from each other. Zionist militias including the Irgun also engaged in terror attacks against both Palestinians and the British occupiers. With increasing violence and with Jews making up one-third of the population of Palestine, but owning only 7% of the land, the UN in 1947, in a narrow vote dominated by European nations and former colonies, voted to allocate 55% of Palestine for a Jewish state, called Israel and 45% for a Palestinian state. In 1948 the British withdrew and the Israelis declared independence, which sparked a region-wide war. Arabs vastly outnumbered Jews, but the Israeli's were better-armed, better-

funded, and better-organised. Following this war, the new state of Israel controlled 78% of historic Palestine, Jordan ruled the West Bank, and Egypt had control over the Gaza Strip. More than 750,000 Palestinians, half the native population of Palestine at the time, fled or were expelled from what became Israel.

In 1967, Israel launched a pre-emptive attack against Egypt after Egypt's President Nasser blockaded Israel's only access point to the Red Sea and amassed troops in the Sinai. Jordan and Syria were drawn into the conflict as well. At the end of the so-called Six Day War, Israel had captured and occupied the West Bank from Jordan, the Gaza Strip and Egypt's Sinai Peninsula, and the Syrian Golan Heights. The Sinai was returned to Egypt under a separate peace deal in 1979, but the Golan Heights and the Palestinian territories remain under Israeli occupation.

During this time the Palestinians were represented by numerous groups, many of which saw the [Palestine Liberation Organisation](#) under its leader Yasser Arafat, the head of Fatah at its center. Founded in 1964, the PLO was admitted to the UN with observer status in 1974, initially operating out of Jordan and Lebanon, engaging in guerrilla tactics in an attempt to regain Palestine by force of arms. It was expelled from Jordan in 1971 by King Hussein, then expelled from Lebanon in 1982 by Israel, at which point it fled to Tunisia.

In 1988, the [PLO](#) under Arafat agreed to recognise Israel and renounce terrorism. It was a historic compromise. He unilaterally surrendered Palestinian claims to 78% of historic Palestine and agreed to focus aspirations for Palestinian statehood solely on the remaining 22%, the West Bank and Gaza.

Five years later, in 1993, Arafat and Israeli Prime Minister Yitzhak Rabin signed the Oslo Accords, hailed as a blueprint for peace between the two peoples. It was the first time Israelis and Palestinians publicly recognised each other as partners for peace rather than enemies who might be defeated by force of arms. In October 1994, Israel signed a peace treaty with Jordan, leaving Syria and Lebanon the only countries bordering Israel that were still in a state of conflict with it.

The Accords created the Palestinian Authority (PA), headed by Arafat and based in Ramallah. It had limited administrative and security duties in the West Bank and Gaza while Israel still retained much control. Two years later, Rabin was assassinated by a right-wing Israeli who opposed the Oslo Accords. Rabin's replacement, Shimon Peres of the moderate Labour Party, was narrowly defeated a year later by Benjamin Netanyahu of the right-wing Likud Party. Netanyahu opposed the Accords, rejected the idea of a Palestinian state, and intensified settlement building in the occupied territories.

In July of 2000, the Labour Party was back in power, and Israeli public opinion had moved away from

Netanyahu's hard line approach, which soured relations with the Western and Arab worlds without any benefit to security. But Israelis were wary because Hamas and Islamic Jihad had committed fourteen suicide bombings during the Oslo years. And Palestinians felt betrayed because instead of retreating from the occupation as promised, the Israelis had only intensified it.

President Bill Clinton, in his final months in office, met with Israeli Prime Minister Ehud Barak and Yasser Arafat at Camp David, Maryland, for a last-ditch effort to negotiate a two-state solution. The talks failed spectacularly. From the Israeli perspective, Barak made a 'generous offer' -- including more than 90% of the West Bank and parts of East Jerusalem -- which went further than any other Israeli leader had been willing to go. Arafat rejected the deal. The result led to a Palestinian uprising and to a new Israeli Prime Minister, Ariel Sharon of the right-wing Likud party. The unrest spiraled from Palestinian protests and harsh Israeli repression into riots, suicide bombings, and massive Israeli military incursions. Israel as result in 2005 unilaterally disengaged from the Gaza Strip, evacuating settlers and its military while retaining control over most points of entry into the Gaza Strip. The election of [Hamas](#) to head the Palestinian Legislative Council in 2006 froze relations between Israel and the Palestinian Authority (PA). In 2006 Israel engaged in a 34-day conflict with [Hezbollah](#) in Lebanon in June-August 2006 and a 23-day conflict with [Hamas](#) in the Gaza Strip during December 2008 and January 2009. Prime Minister Binyamin Netanyahu formed a coalition in March 2009 following a February 2009 general election. Direct talks with the PA launched in September 2010 collapsed following the expiration of Israel's 10-month partial settlement construction moratorium in the West Bank.

As a result of the Israeli/Palestinian conflict, Israel primarily conducts financial activity outside the Middle East with the markets of the US and Europe, and, to an increasing extent, with Asia. Criminal groups in Israel, either home-grown or with ties to the former Soviet Union, US, and EU, are active. Israel's illicit drug trade is regionally focused, with Israel more of a transit country than a market destination. The majority of money laundered originates from criminal activities abroad, including "carousel fraud," which takes advantage of international value added tax loopholes. Proceeds from domestic criminal activity also continue to contribute to money laundering activity. Electronic goods, liquor, cigarettes, cell phones, and pharmaceuticals, especially Viagra and Cialis, have all been seized in recent smuggling operations. Concerns also exist about money laundering in the diamond industry, illegal online gambling rings, retail businesses suspected as money laundering enterprises, and public corruption.

Still with the Israeli Palestinian conflict still unresolved the most significant risks remain with terrorism and terrorism finance.

The Irgun - Israel / Palestine

"The National Military Organisation in the Land of Israel", or Irgun was a Zionist paramilitary group that operated in Mandate Palestine between 1931 and 1948. It was an offshoot of the earlier and larger Jewish paramilitary organisation Haganah and became a political predecessor to Israel's right-wing Herut (or "Freedom") party, which led to today's Likud party, which has led or been part of most Israeli governments since 1977. Irgun policy was based on the proposition that only with armed force by Jews would they force Arabs in Palestine to accept a Jewish State. One of the main operations for which the Irgun is best known was the bombing of the King David Hotel in Jerusalem in 1946 which as a result the Irgun became viewed as a terrorist organisation or an organisation which carried out terrorist acts. The Irgun was assimilated into the Israeli Defence Forces following the establishment of the State of Israel.

Kahane Chai - Israel

Kach, the predecessor to Kahane Chai, was founded by radical Israeli-American Rabbi Meir Kahane with the goal of restoring Greater Israel, which is generally used to refer to Israel, the West Bank, and Gaza. Its offshoot, Kahane Chai, (translation: "Kahane Lives") was founded by Meir Kahane's son Binyamin following his father's 1990 assassination in the US. Both organisations were designated as US Foreign Terrorist Organisations on October 8, 1997. The group has attempted to gain seats in the Israeli Knesset over the past several decades but has won only one seat in 1984. Kahane Chai has harassed and threatened Arabs, Palestinians, and Israeli government officials, and has vowed revenge for the death of Binyamin Kahane and his wife. The group is suspected of involvement in a number of low-level attacks since the start of the First Palestinian Intifada in 2000. Since 2003, Kahane Chai activists called for the execution of former Israeli Prime Minister Ariel Sharon, and physically intimidated other Israeli and Palestinian government officials who favored the dismantlement of Israeli settlements. Although they have not explicitly claimed responsibility for a series of mosque burnings in the West Bank, individuals affiliated with Kahane Chai are widely suspected of being the perpetrators. It receives support from sympathizers in the US and Europe.

Abergil Crime Family - Israel

Widely regarded as the foremost syndicate in Israel's mafia, the Abergil Family is today run by brothers Yitzhak and Meir Abergil. It is also considered to be among the world's top 40 largest drug importers to the US. Yitzhak and Meir were arrested and extradited to the US in 2001. According to law enforcement sources in Israel the family's syndicate is reported to have continued operations in the absence of its leaders, though in August of 2011 Meir Abergil was permitted to return to Israel after plea negotiations with US officials.

Alperon Crime Family - Israel

The Alperon crime family rose to prominence under the leadership of Yaakov Alperon. Yaakov and his brothers

established a protection racket and conducted widespread extortion. In 1993 Yaakov was jailed for four and a half years, while two of his brothers faced similar convictions. The Alperon family was also involved in long term feuding with other Israeli mafia groups, including Zeev Rosenstein, as well as the Abutbul and Abergil families in disputes surround the bottle recycling industry. These bottles acted as a covert form of payment in a protection racketeering scheme, as the bottles could be exchanged for cash. In 2006, at a meeting held between Israeli mafia leader Amir Mulner and Yaakov Alperon in order to resolve a dispute, Alperon reportedly stabbed Mulner in the neck and Yaakov Alperon and his son went into hiding. In 2008 Yaakov Alperon was assassinated, killed by a bomb blast detonated in his car. The chief suspect is believed to be Mulner. At his father's funeral one of Alperon's sons is reported to have sworn revenge, promising that: "We will find the man who did this. I'll send this man to God. He won't have a grave because I'll cut off his arms, his head, and his legs."⁹⁹

Zeev Rosenstein Organisation - Israel

Zeev Rosenstein was a leading crime boss in Israel until his arrest in 2004.¹⁰ Rosenstein was charged with distributing ecstasy in the US after the seizure of 700,000 ecstasy tablets in Manhattan. Prior to his arrest Rosenstein had been engaged in the feuding between rival Israeli syndicates and had survived seven attempts on his life, earning him the name "wolf with seven lives" (Zeev meaning wolf in Hebrew).

Palestine Liberation Organisation (PLO) - Palestine

The Palestine Liberation Organisation (PLO) is a political and paramilitary organisation which was created in 1964, recognised as the "sole legitimate representative of the Palestinian people" by the UN and over 100 states with which it holds diplomatic relations. The PLO was considered by the US and Israel to be a terrorist organisation until 1991. In 1993, the PLO recognised Israel's right to exist in peace, accepted UN Security Council resolutions 242 and 338, and rejected "violence and terrorism"; in response, Israel officially recognised the PLO as the representative of the Palestinian people. Yasser Arafat was the Chairman of the PLO Executive Committee from 1969 until his death in 2004. He was succeeded by Mahmoud Abbas (also known as Abu Mazen). Initially, as an armed guerrilla organisation, the PLO was responsible for terrorist activities performed against Israel in the 1970s and early 1980s. In 1988, however, the PLO officially endorsed a two-state solution, contingent on terms such as making East Jerusalem capital of the Palestinian state and giving Palestinians the right of return to land occupied by Palestinians prior to 1948, as well as the right to continue armed struggle until the end of "The Zionist Entity." In 1996, the PLO nullified the articles of the PLO's Charter, or parts of it, which called for the destruction of Israel and for armed resistance. The PLO has numerous factions though the top 3 include; Fatah which is the largest faction, and was the faction led by Yasser Arafat, (with sub-factions or armed wings or splinter groups from

Fatah including: Black September; Al-Aqsa Martyrs Brigade and Tanzim; the Popular Front for the Liberation of Palestine (PFLP), the second largest faction, the Democratic Front for the Liberation of Palestine (DFLP) the third largest. Abu Nidal, although no longer active split from the PLO in 1974.

Fatah - Palestine

Fatah is a secular Palestinian nationalist organisation that has played, and continues to play, a pivotal role in Palestinian politics. Fatah was originally founded in 1959 by 5 Palestinian activists operating out of Kuwait: Yasser Arafat, Khalil El-Wazir, Salah Khalaf, Khalid al-Hasan, and Faruk Qaddumi. Fatah was the first Palestinian group to openly call for a direct conflict with Israel. From a base focussed solely on violent resistance to Israel and over time with increasing popularity and membership Fatah expanded its sphere of activity to include civil and social affairs. This move allowed Fatah to create a broad popular base for its organisation, which though affiliated with the violent struggle, in truth had little or no involvement with the violent attacks perpetrated by the organisation's more martial elements. Following the Arab defeat in the 1967 Arab-Israeli War (a conflict fought between Israel and the Arab states of Egypt, Jordan and Syria), Fatah aligned itself with the PLO and soon came to dominate the organisation. By the time the 1960s came to a close Fatah had succeeded in securing the support of several Arab and Eastern-bloc states, and by 1974 a Fatah dominated PLO had been officially recognised by the Arab summit and the UN.

During the intifada, a mass protest that broke out in late 1987, the Fatah dominated PLO again demonstrated its capacity for non-violence and attempted to use the unrest to press for a peace settlement with Israel. It is therefore important to recognise that the history of Fatah has not been exclusively violent, but rather a campaign that has swung frequently between an emphasis on violent uprising, and peaceful social regeneration. As a result of Fatah and the PLO's move towards a settlement in late 1988 a dialogue was established between the warring factions in Israel and Palestine; a dialogue that led directly to the 1993 Oslo Accords. As part of the milestone agreement all PLO factions, including Fatah, recognised the State of Israel and renounced acts of terrorism. Since 1993, the PLO has transformed itself into a quasi-government, the Palestinian Authority (PA) with Arafat and Fatah still playing the dominant roles. While Fatah and Arafat formally committed themselves to working with Israel towards peace, the reality has been much more complicated. Many Fatah members are actively engaged in legitimate Palestinian Authority governmental activities, however certain factions within Fatah have re-committed themselves to violence. Notably, the al-Aqsa Martyrs Brigades and the Fatah-Tanzim have been implicated in terrorist activities against Israeli targets. While Fatah leaders maintain that these factions operate autonomously, beyond the control of the mainstream movement, Israel accuses Fatah not only of condoning, but also of controlling these militant

activists. Irrespective of whether such allegations hold any veracity, there exists an undeniable fissure between Fatah's traditional role as the source of violent Palestinian resistance and its more recent function as a governmental institute.

Since 2005 however, Fatah's influence as a political party has waned considerably, largely as a result of internal dissension, and the organisation was replaced in 2006 by Hamas as the governing party. Factional clashes in the Gaza strip between supporters of the two political entities following this transition have claimed lives on both sides. Today, whilst the State of Palestine was declared as an Independent State in 2013, Fatah effectively leads in the West Bank and Hamas in the Gaza Strip, whilst Israel continues to dominate and dictate the terms of co-existence.

Al-Aqsa Martyrs Brigades - Palestine

Designated as a US Foreign Terrorist Organisation on March 27, 2002, the al-Aqsa Martyrs Brigade is composed of an unknown number of small cells of Fatah-affiliated activists that emerged at the outset of the al-Aqsa Intifada, in September 2000. Al-Aqsa's goal is to drive the Israeli military and West Bank settlers from the West Bank in order to establish a Palestinian state loyal to Fatah. Al-Aqsa employed primarily small-arms attacks against Israeli military personnel and settlers as the intifada spread in 2000, but by 2002 they turned increasingly to suicide bombings against Israeli civilians inside Israel. In January 2002, the group claimed responsibility for the first female suicide bombing inside Israel. In 2010, The group continues to launch rocket attacks on communities in Israel. Most of al-Aqsa's operational activity is in Gaza but the group also planned and conducted attacks inside Israel and the West Bank. The group also has members in Palestinian refugee camps in Lebanon. Iran has exploited al-Aqsa's lack of resources and formal leadership by providing funds and guidance, mostly through Hezbollah facilitators. The AAMB has since become known as the al-Sha'id Yasser Arafat Brigades.

Tanzim - Palestine

The Tanzim militia, were founded in 1995 by Yasser Arafat and other Fatah leaders to counter Palestinian Islamism and is widely considered to be an armed offshoot of Fatah with its own leadership structure. The acknowledged head of the Tanzim is Marwan Barghouti, who is as of 2010, serving five consecutive life sentences in Israel for murder, and, according to some accounts, has a substantial following among the "rejectionist" camp which opposes the Interim Agreement/Oslo accords signed on 28 September 1995 with Israel. Tanzim came to prominence in the street fighting which marked the beginning of the second Palestinian Intifada. Its members tend to be younger than those of other Fatah factions, often having grown up in the post-Oslo era. Many Tanzim members have joined the al-Sha'id Yasser Arafat Brigades (formerly the al-Aqsa Martyrs' Brigades). Tanzim has also recruited female suicide bombers,

including Andaleeb Takatka, a 20-year-old Bethlehem woman who detonated an explosive belt at a Jerusalem bus stop in April 2002, killing six Israeli civilians, and injuring sixty. The exact nature of the relationships between the Tanzim, Fatah leadership and the al-Aqsa Martyrs Brigades (now al-Shaid) remains unclear. Fatah's leadership has publicly renounced terrorist activity and claims that the Tanzim and the Yasser Arafat Brigades operate independently. Many terrorist attacks within Israel and the Occupied Territories, however, were still reported as being the work of al-Fatah in general. Tanzim is known to have run summer training camps and instilled a high level of discipline in its predominantly college aged recruits. Aside from its military exploits, the organisation also operates at the grassroots level, cultivating support in neighbourhood cells. In the early 2000s the group claimed a membership of 10,000 mainly in Gaza and the West Bank, though the number of active militants is undoubtedly considerably less than this. According to an Israeli Defence Forces spokesperson, Tanzim militants are believed to have equipped themselves with German MP-5 submachine guns smuggled into Palestine from Jordan and Egypt. In terms of ideology Tanzim has followed the political and spiritual direction of Arafat throughout his political career. Prior to his death in 2004 it had however been questioned whether Arafat still maintained control over this powerful militia. Since the rise to power of Hamas in the Gaza strip, tensions have mounted between militia's aligned with al-Fatah, and those allied to Hamas. However in 2011 a reconciliation agreement was signed, and in 2013 the two parties met in Cairo in an attempt to make a deal. After a first round of discussions lasting 8 hours, the outcome of the second round has yet to emerge.

Black September - Palestine

The Black September Organisation (BSO) came into existence in 1971, professing itself to be a distinct splinter group from Fatah. The self-proclaimed objective of the group was to avenge the expulsion of the Palestine Liberation Organisation (PLO) from Jordan in September of 1970. This expulsion of the PLO became known as "Black September," a period from which the group derived its name. Despite purporting to be an autonomous splinter group, enduring connections with Fatah were revealed following the arrest of BSO operatives. It emerged that rather than a breakaway faction, BSO was in fact the creation of Fatah as a means of continuing operations in other Arab nations without implicating itself at a time when it had declared that it would not interfere in the domestic situations of neighbouring Arab nations. The operational period of the BSO was relatively brief, lasting in total three years until the end of 1973, however during this time the terrorist attacks perpetrated were of international significance. Particularly infamous was the BSO's attack on Israeli Olympians in Munich in 1972, in which 11 athletes perished. As a result the BSO suffered a severe backlash from Israeli security forces bent on eradicating the group. In

1974, having sustained heavy losses, Black September was disbanded by Fatah. The group's members did not however simply fade into obscurity, with attacks continuing in the organisation's name for some time following its official dissolution. Many BSO members were also absorbed by other terrorist organisations such as the Popular Front for the Liberation of Palestine (PFLP). Today the group is now considered inactive.

Abu Nidal Organisation - Palestine

The Abu Nidal Organisation (ANO) was an infamous Palestinian terrorist group who split from the Palestinian Liberation Organisation (PLO) when the latter proposed the creation of the Palestinian National Authority in 1974. Group leader Sabri al-Banna aka Abu Nidal believed that no goal other than the total liberation of the Palestinian people was acceptable and that the only method by which to accomplish that goal was armed struggle. Abu Nidal bore a deep-seated hatred for Israel ("It is a crime to allow the Zionists to leave our land alive"), the US ("Were it not for American support, the Zionist ghost would have long vanished from the world arena") and Arab leaders who have engaged politically with Israel or the West. Abu Nidal sometimes referred to these leaders as "Zionists who are not Jews," and they became the target of many ANO attacks

The Abu Nidal Organisation, despite its vehement use of the Zionist label for its enemies, was not in fact a religious group. Rather Sabri al-Banna was primarily motivated by anger over the displacement of his family from Palestinian land during the 1948 Israeli War of Independence. The peak of the ANO's power was reached during the 1980s, at which point terrorism experts deemed it to be the foremost international terrorist organisation in the world. With as many as 400 members, along with a plethora of different organisation names (a subterfuge intended to portray ANO operations as the work of disparate groups), at the height of its operational power the ANO boasted a sophisticated internal structure. For instance in 1985 the ANO established its Intelligence Directorate, beneath which resided four sub-committees: the Committee for Special Missions, The Foreign Intelligence Committee, the Counter-Espionage Committee, and the Lebanon Committee. It was therefore, at least in designation, a structure highly reminiscent of many western government security services. The Committee for Special Missions was responsible for selecting suitable targets for ANO attacks and would compile short-lists to be reviewed by Abu Nidal and committee's head al-Ali. It was however the Intelligence and Espionage elements of the ANO, and indeed of Abu Nidal's psyche, that proved to be the organisation's undoing. By 1987, at the behest of Abu Nidal, the ANO had turned its intelligence apparatus inwards, focusing on the suspected plots and deceptions of its own members. The consequences of this internal scrutiny and for the most part paranoia were astounding; in one night in November 1987 some 170 ANO members were executed and concealed in a mass grave. Soon after a further 160 members met a similarly

gruesome end in Libya, considerably weakening the international capabilities of the group.

The finances of the ANO are believed to have been derived primarily from the government sponsorship of Syria, Libya, and Iraq. In Libya, Nidal built a close personal relationship with then leader Muammar Gaddafi, from whom he gained a great deal of support. This patronage however came to an end when Libyan connections to the Lockerbie bombing emerged, after which Gaddafi expelled Abu Nidal from Libya in an attempt to separate himself from the politically damaging image of terrorism. Arguably the most prominent terrorist strike made by the ANO during its operational years was its simultaneous attack on the airports of Rome and Vienna in 1985.¹¹ In the Leonardo Da Vinci International Airport in Rome ANO gunmen opened fire at Israel's El Al ticket kiosk killing 16 people and injuring 99 others. Minutes later in Vienna International Airport hand grenades were aimed at passengers waiting to board a flight to Tel Aviv, resulting in 2 fatalities and 39 injuries. The purpose of these attacks is believed to have been to damage prospects of Israeli-Palestinian peace talks; a process with which the Italian and Austrian governments were closely involved. However since the late 1980s the ANO has not attacked a Western target, and in August of 2002 the Iraqi government claimed that Abu Nidal had committed suicide in Iraq. Speculation continues to circulate around the true circumstances of Nidal's death, with many believing that Saddam Hussein ordered his assassination, while others contend that Nidal is not really dead. In 2008 a report was published by The Independent's Middle East Correspondent Robert Fisk after reportedly gaining access to Iraqi files indicating that Abu Nidal had undergone interrogation by Iraqi intelligence officers prior to his death. The remaining leadership of the organisation has publicly stated that the ANO did not die with its founder and that a new leader will be named. Irrespective of this claim it is thought to be highly unlikely that the group will reactivate

Popular Front for the Liberation of Palestine (PFLP) - Palestine

PFLP is a Marxist-Leninist group founded in 1967 by George Habash as a member of the PLO, advocating a Pan-Arab revolution. The group earned a reputation for spectacular international attacks in the 1960s and 1970s, including airline hijackings that killed many. A leading faction within the PLO, the PFLP has long accepted the concept of a two-state solution but has opposed specific provisions of various peace initiatives. The PFLP opposed the Declaration of Principles signed in 1993 and suspended its participation in the PLO. It committed numerous international terrorist attacks during the 1970s. Since 1978 PFLP has carried out numerous attacks against Israeli or moderate Arab targets, including the killing of a settler and her son in December 1996. It receives most of its financial and military assistance from Syria and Libya. The PFLP stepped up its operational activity during the Second Intifada. This

was highlighted by at least two suicide bombings since 2003, multiple joint operations with other Palestinian terrorist groups, and the assassination of Israeli Tourism Minister Rehavam Ze'evi in 2001, to avenge Israel's killing of the PFLP Secretary General earlier that year. The PFLP was involved in several rocket attacks, launched primarily from Gaza, against Israel in 2008 and 2009, and claimed responsibility for numerous attacks on Israeli forces in Gaza, including a December 2009 ambush of Israeli soldiers in central Gaza. The PFLP claimed numerous mortar and rocket attacks fired from Gaza into Israel in 2010, as well as a February attack on a group of Israeli citizens. In 2011, the group continued to use rockets and mortars to target communities in Israel.

Democratic Front for the Liberation of Palestine (DFLP) - Palestine

The Democratic Front for the Liberation of Palestine was formed from a break from PFLP in 1969. It called for more Maoist and a non-Nasserist approach and demanded a socialist policy and alignment of the Arab world, drawing models from China, Vietnam and Cuba. Despite its criticism of Arafat, DFPL has always supported PLO unity; It believes Palestinian national goals can be achieved only through the revolution of the masses. It opposed the Declaration of Principles (DOP) signed in 1993. In the early 1980s it occupied a political stance midway between Arafat and the rejectionists. It split into two factions in 1991, one pro-Arafat and another more hardline faction headed by Nayif Hawatmah (which suspended its participation in the PLO). In the 1970s it carried out numerous small bombings and minor assaults and some more spectacular operations in Israel and the occupied territories, concentrating on Israeli targets. It is involved only in border raids since 1988, but continues to oppose the Israel-PLO peace agreement. It received financial and military aid from Syria and Libya.

Palestine Islamic Jihad (PIJ) - Palestine

The PIJ originated among militant Palestinians in the Gaza Strip during the 1970s and is sometimes known as the Al-Quds Brigades. Committed to the creation of an Islamic Palestinian state and the destruction of Israel through holy war. Because of its strong support for Israel, the US has been identified as an enemy of the PIJ, but the group has not specifically conducted attacks against US interests in the past. In July 2000, however, it publicly threatened to attack US interests if the US Embassy was moved from Tel Aviv to Jerusalem. Also it opposes moderate Arab governments that it believes have been tainted by Western secularism. It has conducted at least three attacks against Israeli interests in late 2000, including one to commemorate the anniversary of former PIJ leader Fathi Shqaqi's murder in Malta on 26 October 1995. It conducted suicide bombings against Israeli targets in the West Bank, Gaza Strip, and Israel. PIJ attacks in 2008, 2009, and 2010 were primarily rocket attacks aimed at southern Israeli

cities, but also included attacking Israeli targets with explosive devices. PIJ continued operations into 2011, claiming responsibility for a mortar attack in Sderot, Israel in February, and a rocket attack in Ashdod, Israel in March. It receives financial assistance and training primarily from Iran

Palestine Liberation Front (PLF) - Palestine

The PLF broke away from the PFLP in the mid-1970s and later would split again into pro-PLO, pro-Syrian, and pro-Libyan factions. Pro-PLO faction led by Muhammad Abbas (Abu Abbas), who became a member of PLO Executive Committee in 1984 but left it in 1991. The Abu Abbas-led faction is known for aerial attacks against Israel. Abbas' group also was responsible for the attack in 1985 on the cruise ship Achille Lauro and the murder of US citizen Leon Klinghoffer. After going approximately 16 years without claiming responsibility for an attack, the PLF claimed responsibility for two attacks against Israeli targets in 2008. One attack was against an Israeli military bus in Huwara, Israel, and the other involved a PLF "brigade" firing at an Israeli settler south of the Hebron Mountain, seriously wounding him. On March 28, 2008, shortly after the attacks, a PLF Central Committee member reaffirmed PLF's commitment to using "all possible means to restore" its previous glory and to adhering to its role in the Palestinian "struggle" and "resistance," through its military.

Army of Islam (AOI) - Palestine

The Army of Islam is a Gaza-based terrorist organisation founded in late 2005 that has been responsible for numerous terrorist acts against the Governments of Israel and Egypt, as well as American, British, and New Zealander citizens. AOI is led by Mumtaz Dughmush, and operates in Gaza. It subscribes to a Salafist ideology together with the traditional model of armed Palestinian resistance. AOI has previously worked with Hamas and is attempting to develop closer Al-Qaeda contacts. AOI's terrorist acts include a number of rocket attacks on Israel, the 2006 kidnapping of two journalists in Gaza (an American and a New Zealander), and the 2007 kidnapping of a British citizen, journalist Alan Johnston, in Gaza. AOI is also responsible for early 2009 attacks on Egyptian civilians in Cairo and Heliopolis, Egypt. AOI is alleged to have planned the January 1, 2011 Alexandria attack on a Coptic Christian church that killed 25 and wounded 100. On May 7, 2011, the group released a eulogy for bin Laden via its Al Nur Media Foundation. AOI receives the bulk of its funding from a variety of criminal activities in Gaza. It was designated a US Foreign Terrorist Organisation on 19 May 2011.

Hizb-ut-Tahrir - Palestine/Global

Hizb ut-Tahrir or Party of Liberation is an international pan-Islamic political organisation. They are commonly associated with the goal of all Muslim countries uniting as an Islamic state or caliphate ruled by Islamic law and with a caliph head of state elected by Muslims. The organisation was founded in 1953 as a Sunni Muslim

organisation in Jerusalem by Taqiuddin al-Nabhani, an Islamic scholar. Since then Hizb ut-Tahrir has spread to more than 40 countries and by one estimate has about one million members. Hizb ut-Tahrir is very active in the West, particularly in the United Kingdom, and is also active in several Arab and Central Asian countries, despite being banned by some governments, including by the Russian Government and many in the middle east. The group also has a growing presence in North America, known as Hizb ut-Tahrir America, or HTA. Hizb ut-Tahrir believes the re-establishment of caliphate would provide stability and security to both Muslims and Non-Muslims in the predominantly Muslim regions of the world. The party promotes a detailed program for the institution of a caliphate that would establish Shariah and carry "the Da'wah of Islam" to the world. Hizb ut-Tahrir is also strongly anti-Zionist and calls for Israel, which it calls an "illegal entity," to be dismantled.

Whilst Hizb ut-Tahrir's is officially opposed to violence this has often been questioned. For example, the think tank GlobalSecurity.org states that Hizb ut-Tahrir "is not against violence as such. It is just against the use of violence now." Zeyno Baran of the Nixon Center and Ariel Cohen of the Heritage Foundation have argued that although Hizb ut-Tahrir does not promote or engage in violence, it acts as a "conveyor belt" for young Muslims, using its legal status to indoctrinate them before they leave the group to join more extreme groups that may engage in violence.

An investigative journalist specialising in British terrorism, Shiv Malik sympathizes with the position, stating that it "is not without foundation." In support of this perspective, Malik quotes unnamed intelligence sources stating that Abu Musab al-Zarqawi, a leader of Al-Qaeda in Iraq, and Al-Qaeda leader Khalid Sheikh Mohammed are both former members of Hizb ut-Tahrir. Omar Sharif, who attempted a suicide bombing in Israel in 2003, is also alleged to have been affiliated with Hizb ut-Tahrir, but the group denies this, stating that "despite extensive investigations by the police and security services, including legal proceedings against members of the Sharif family, no link to Hizb ut-Tahrir has ever been proven." The British government, in a classified report, discounted the conveyor belt theory, stating "We do not believe that it is accurate to regard radicalisation in this country as a linear 'conveyor belt' moving from grievance, through radicalisation, to violence ... This thesis seems to both misread the radicalisation process and to give undue weight to ideological factors."

Special Focus 4

Hamas - Palestine

Founded in 1987 during the First Intifada, Hamas represents a violent splinter group of the Muslim Brotherhood is a religious movement adhering to the Sunni sect of the Islamic faith, which began its political activity in Egypt and focussed primarily on non-violent activism. The new and altogether more violent Hamas (the word translates to mean 'zeal') was established by Sheik Ahmed Yassin, a man who had formerly participated in a great deal of non-violent work aimed at social regeneration in the Palestinian territories and who had directed Muslim Brotherhood activities in the area. However, by the 1980s Yassin had begun to favour a combined approach of social aid, political activity, and violent action.

Hamas' social services division, which includes charities, schools, youth camps, fund raising and medical clinics, is known as the "Dawa." This body has proved highly effective in creating a popular base of support for Hamas, supporting many vulnerable groups, operating largely free of corruption and as a result acting as an effective means of recruitment. The Dawa in particular has allowed Hamas to project a form of legitimacy at least with some, for example whilst the US and Israeli governments designate Hamas in its entirety as a Terrorist Organisation, the EU lists only the military wing of Hamas and not its so called social wing. The military wing of Hamas is known as the Izz ad-Din al-Qassam Brigades and has been responsible for numerous attacks against both civilian and military targets. These attacks first began in 1987, and included not only Israeli targets, but also Israeli collaborators within Palestinian society. The organisation's first suicide bombing was undertaken in April of 1993, detonating a roadside bomb near Mehola in the West Bank. Such attacks have since become characteristic of the group's operations.

Up until 2005, Hamas conducted numerous anti-Israeli attacks, including suicide bombings, rocket launches, improvised explosive device (IED) attacks, and shootings, contributing significantly to many deaths and injuries in the Second Intifada killings (2000-2004) and though Hamas has not directly targeted non-Israeli targets or interests, the group makes little or no effort to avoid collateral damage to foreigners. Hamas suspended terrorist attacks in February 2005, though has been responsible for rocket fire into Israel since.

Hamas probably has several hundred operatives in its armed wing, the al-Qassam Brigades, along with its

reported 9,000-man Executive Force and tens of thousands of supporters and sympathizers. Hamas has an operational presence in every major city in the Palestinian territories and currently focuses its anti-Israeli attacks on targets in the West Bank and within Israel. The group retains a cadre of leaders and facilitators that conducts diplomatic, fundraising, and arms smuggling activities in Lebanon, Syria, and other states. Hamas is also increasing its presence in the Palestinian refugee camps in Lebanon, probably with the goal of eclipsing Fatah's longtime dominance of the camps. Hamas receives some funding, weapons, and training from Iran. In addition, fundraising takes place in the Gulf countries, but the group also receives donations from Palestinian expatriates around the world and private benefactors in Arab states. Some fundraising and propaganda activity takes place in Western Europe and North America. Charities have also been a significant source of financing for Hamas including from the [Holy Land Foundation](#), the [Al-Aqsa Foundation](#), [Interpal](#), [Association de Secours Palestiniens](#), [Comité de Bienfaisance et de Secours aux Palestiniens](#), the [Palestinian Association of Austria](#) and the [Sanabel Association for Relief and Development](#). US Plaintiffs' groups involved in litigation have claimed that [Hamas](#) receives "funding" from a global family of charities established by the [Muslim Brotherhood](#) under the umbrella of the Union of Good.

The political or "Shura Council" that oversees all Hamas operations and is responsible for all major decision making established its headquarters abroad first in the US, then Jordan and then Syria, before establishing itself firmly now in Gaza, following its victory in first winning control of the PA legislature and cabinet in January 2006. Following the election the US and EU ceased to provide financial aid to the Palestinian government in response to the new administration's failure to accept past peace agreements with Israel. The transition in political power led to a direct conflict between Hamas and Fatah in 2007 known as the Battle of Gaza. Despite receiving aid from the US and Israel, Fatah forces were defeated in the Gaza Strip, and two de-facto governments have arisen within Palestine. Hamas continues to govern the Gaza strip led by Prime Minister Ismail Haniyeh, while Fatah governs the West Bank and has in 2013 renamed itself the State of Palestine. Reconciliation between the two groups has yet to be reached, though economic links have been maintained between the two areas.

While Hamas is very much distinct from Al-Qaeda as an organisation, investigators report links between the Muslim Brotherhood (from which Hamas emerged) and AQ, and suggest that AQ cells have supplied funds to Hamas. The Sunni denomination adopted by Hamas has also made the group widely appealing to many Islamist groups in North Africa. Hamas might therefore be viewed as a localised expression of a larger picture, in which an increasing fusion of religion (particularly Islam) and politics has emerged with greater vitality across much of the Middle East and North Africa.

Syria

Following World War I, France acquired a mandate over the northern portion of the former Ottoman Empire province of Syria administering the area as Syria until granting it independence in 1946. The new country lacked political stability, however, and experienced a series of

military coups during its first decades. Syria united with Egypt in February 1958 to form the United Arab Republic. In September 1961, the two entities separated, and the Syrian Arab Republic was re-established. In the 1967 Arab-Israeli War, Syria lost the Golan Heights to Israel. The current regime is led by Bashar al-Assad who succeeded his father after he died in 2000. The modern Syria was founded by Hafez al-Assad and is dominated by Alawite Muslims, which is an offshoot of the Shi'ite branch of Islam. The Alawites are a minority in Syria, but dominate the government and the military. Hezbollah, based in neighboring Lebanon and which depends on the Assad regime and Iran for finance and weapons, has crossed into Syria and joined the battle against the rebels. International pressure on the Assad regime has intensified since the start of the Arab Spring in late 2011, as the Arab League, EU, Turkey, and the US have expanded sanctions as a full blooded civil war rages in Syria. Numerous groups are battling it out against the government's security forces backing the Al-Assad regime in many areas of the country. The civil war has escalated with charges against the regime of using chemical weapons on civilians. On the opposition side, the main combatants are the Free Syrian Army, the Syrian Islamic Liberation Front, Jabhat al-Nusra, the Syrian Islamic Front, the Al-Nusra Front; the Islamic State of Iraq and Syria (ISIS). The Free Syrian Army is considered the most moderate of the opposition groups. The relatively moderate force emerged from the street protests and initial Syrian army defections to take on Assad's force, and are made up largely of Sunni Muslims, who are a majority in Syria, but is badly divided among different factions.

Syrian Islamic Liberation Front - Syria

The Syrian Islamic Liberation Front is probably the largest of the armed opposition groups and works alongside the Free Syrian Army. Founded in September 2012 after secret negotiations between the group's leaders, the group is headed by Ahmed Eissa al-Sheikh, the leader of the Suqour al-Sham Brigade. The coalition includes around 20 groups and has tens of thousands of fighters active throughout much of Syria, with the most important being the Suqour al-Sham Brigade (Idlib), Farouq Brigade (Homs), Liwa al-Islam (Damascus) and Tawhid Brigade (Aleppo). The group has an Islamist ideology. It

includes both Muslim Brotherhood and Salafist inspired groups, however the group is not seen as hardline as either the Syrian Islamic Front or the al-Nusra Front, and far removed from ISIS.

Syrian Islamic Front - Syria

The Syrian Islamic Front or al-Jabhab al-Islamiyya as-Suriyah is a Salafist umbrella organisation of Islamist rebel groups. It may now also be operating as Harakat Ahrar al-Sham al-Islamiyya (The Islamic Movement of Ahrar al-Sham). Its largest group is the Salafist Ahrar al-Sham, which reportedly "leads" and "dominates" the Front. The group was founded by eleven Islamist rebel groups including: Ahrar al-Sham, Al-Haqq Brigade in Homs, the Al-Fajr Islamic Movement in Aleppo, Ansar Al-Sham in Latakia, Jaysh Al-Tawhid in Deir ez-Zor and the Hamza ibn 'Abd al-Muttalib Brigade in Damascus. The Group does not include the jihadist Al-Nusra Front, though is prepared to work with other opposition groups including with the Front.

Al-Nusra Front/Jubhat al-Nusra - Syria

The Al-Nusra Front or Jubhat al-Nusra is a radical Islamic force that has pledged allegiance to Al-Qaeda, has attracted thousands of militant Muslims from around the world, received money and weapons from supporters, and has become one of the rebels' most effective fighting force. It is imposing Sharia law in areas it occupies and has also skirmished with the Free Syrian Army, at times. The Front has been designated by the UN, US, UK, and Australia as a terrorist organisation.

The Islamic State of Iraq and Syria (ISIS) - Syria

The Islamic State of Iraq and Syria (ISIS) also known as The Islamic State of Iraq and the Levant is led by Abu Bakr al-Baghdadi and emerged out of the Al-Nusra Front in 2013 based on a request, it is thought, by Al-Qaeda leader Ayman al-Zawahri to set up an Islamic state in the region. Despite its loyalty to Al-Qaeda, the Al-Nusra Front did not obey the request at the time. The ISIS is made up largely of foreign fighters looking beyond Syria to establish an Islamic Caliphate joining, first Iraq and Syria, whereas the Al-Nusra Front is interested at this stage at least only in the future of Syria. ISIS is supported by and can be considered a sister organisation of AQ in Iraq, with some believing ISIS a rebranded version of AQ in Iraq, to reflect its growing ambitions in the region. It is concentrated mostly in the northern and eastern provinces of the country and with its radical ideology and tactics such as kidnappings and beheadings, the group has stamped its identity on the communities in which it is present, including, crucially, areas surrounding the main border crossings with Turkey. It has been bolstered by an influx of thousands of foreign fighters from the region and beyond.

Syria is subject to increasing Sanctions and Embargoes. For more information on these see Part 1, Section 3, Money Laundering Laws & Regulations; Sanctions & Embargoes above.

Lebanon

After the fall of the Ottoman Empire, after World War I, the League of Nations put Syria under a French mandate who designated what is today's Lebanon which declared independence in 1943. Since independence the country has been marked by periods of political turmoil interspersed with prosperity built on its position as a regional center for finance and trade.

The country's 1975-90 civil war that resulted in an estimated 120,000 fatalities, was followed by years of social and political instability. Sectarianism is a key element of Lebanese political life. Neighboring Syria has long influenced Lebanon's foreign policy and internal policies, and its military occupied Lebanon from 1976 until 2005.

The Lebanon-based Hezbollah militia and Israel continued attacks and counterattacks against each other after Syria's withdrawal, and fought a brief war in 2006. Lebanon's borders with Syria and Israel remain unresolved.

Jund al-Sham - Lebanon / Syria

Jund al-Sham, also known as the Army of the Levant and the Soldiers of Greater Syria, originally established in 1999 in Afghanistan with contacts with Al-Qaeda with new groups resurfacing in 2004 and 2005. Following the US military intervention in Afghanistan, Jund al-Sham was widely scattered and many of its members are believed to have returned to their homelands where other groups operating under the same title surfaced in 2004 and 2005. It is unclear whether the 2004 incarnation in the Lebanon is in fact closely connected with the Asbat al-Ansar. In 2005, a third Jund al-Sham emerged in Damascus and instantly became a highly publicized target of Syrian security authorities. Although the connection between any or all of the Jund al-Sham entities is unclear, they all continue to clash with security elements and rival factions in their respective areas of operation in order to achieve the unified purpose of replacing what they view as misguided forms of Islam and governmental rule with their vision of a traditional Islamic caliphate extending across the Levant, and are considered under the greater Al-Qaeda umbrella and therefore may be expected to remain active in various forms and guises throughout the region. The group is designated as a terrorist organisation by Russia.

Amal - Lebanon

Amal was formed in 1975 by the Iranian Imam Musa Sadr. Despite the founder's Iranian heritage, Amal was

expressly formed to protect and increase the influence of Lebanon's Shi'ite Muslim population. In addition, the group was interested in establishing a theocratic Islamic state. The group's name, Amal, has a double meaning. While Amal means "hope" in Arabic, it also represents an acronym of "Afwaj al Muqawama al Lubnaniya," or in English, "Lebanese Resistance Detachments. In 1974, Musa Sadr founded the "Movement of the Deprived" to advance the political interests of the Shi'ites in Lebanon. Upon the outbreak of Lebanon's civil war in 1975, Musa Sadr established Amal as the military wing of the Movement of the Deprived. Amal would eventually kill dozens through its terrorist attacks. Amal gained legitimacy with an increasing number of Lebanese Shi'ites after Israel's invasion of Lebanon in 1978 and the accompanying clashes between Israelis and Palestinians in southern Lebanon. With the death of Musa Sadr in 1978, Amal's leadership passed to Nabih Berri, a secular politician. Consequently, Berri was more interested in the nationalist goals of the Lebanese Shi'ites rather than any objective to create a theocratic Islamic state. Despite Berri's secularism, Amal benefited from the 1978-1979 Iranian revolution. From 1979 to 1982, Amal received financial assistance from Iran. In 1982, Iran founded Hezbollah to counter the Israeli forces that had entered Lebanon to destroy the PLO's Lebanese base. With Hezbollah's founding, Amal lost Iran's financial backing. In 1985, Syria initiated financial assistance to Amal. Amal's significance has decreased substantially since its founding. The death of Musa Sadr, the group's founder and the rise of Hezbollah have weakened the group.

Asbat al-Ansar (AAA) - Lebanon

Asbat al-Ansar is a Lebanon-based Sunni extremist group composed primarily of Palestinians with links to Al-Qaeda and other Sunni extremist groups. Asbat al-Ansar was designated as a US Foreign Terrorist Organisation on 27 March 2002. Some of the group's stated goals include thwarting perceived anti-Islamic and pro-Western influences in the country, although the group remains largely confined to Lebanon's refugee camps. Asbat al-Ansar first emerged in the early 1990s. In the mid-1990s, the group assassinated Lebanese religious leaders and bombed nightclubs, theaters, and liquor stores. The group has also plotted against foreign diplomatic targets. In October 2004, Maher al-Sa'di, a member of Asbat al-Ansar, was sentenced, in absentia, to life imprisonment for his 2000 plot to assassinate then-US Ambassador to Lebanon David Satterfield. Asbat al-Ansar has no formal ties to the AQ network, but the group shares AQ's ideology and has publicly proclaimed its support for Al-Qaeda in Iraq. Members of the group have traveled to Iraq since 2005 to fight Coalition Forces. Asbat al-Ansar has been reluctant to involve itself in operations in Lebanon due in part to concerns over losing its safe haven in Ain al-Hilwah. The group's primary base of operations is the Ain al-Hilwah Palestinian refugee camp near Sidon in southern Lebanon. It is likely that the group receives money through international Sunni extremist networks.

Special Focus 5

Hezbollah - Lebanon

Although originating in earlier formations, Hezbollah as we know it today was established in 1982 in response to the Israeli occupation of Lebanon. The name Hezbollah literally means the 'Army of God' in Arabic and is a Shiite-dominated political party in Lebanon. Its greatest enemy is Israel, which Hezbollah has refused to acknowledge as a lawful state. Hezbollah has three main goals (i) the eradication of western colonialism in Lebanon; (ii) the upholding of justice for those who have been oppressed; (iii) the transformation of Lebanon into an Islamic state. However, this final aspiration has been deemed impractical and temporarily aborted. Hezbollah is said to have gained strong support in these endeavours from Iran and Syria. In recent years, Hezbollah has expanded its primary activity i.e. military operations, to encompass political and social development in Lebanon. In the 2005 Lebanese General Election, Hezbollah managed to secure 10.9% of the seats in the Lebanese Parliament. It has also participated extensively in social development programmes in Lebanon, such as operating hospitals and clinics, building schools and providing technical assistance in the agricultural sector.

Hezbollah gained its notoriety from its fundamentalist philosophies and the tactics deployed in the liberation of Lebanon during the Israeli occupation in the 1980s. For some, Hezbollah's attacks are justifiable as an appropriate retaliation for Israel's actions against Lebanese civilians. Nonetheless, this view is not shared by many in the international community, including in some Muslim countries such as Saudi Arabia, Jordan and Egypt. In the eyes of Hezbollah supporters, tactics such as suicide bombings, assassinations and the kidnapping of foreigners are considered defensible and heroic aspects of the resistance movement against Israel and its allies. This support does not merely derive from the Shiite Muslim community, but has also garnered support from some in Lebanon's non-Muslim community.

Hezbollah takes the view that the creation of the state of Israel is unlawful, that the US and UK are primarily responsible, and that they exacerbate the situation by their support and funding of Israel. Thus, Hezbollah justifies its hostility towards Israel and its allies, seeing any aggression towards Israel as a patriotic resistance to oppression. Notable examples of such hostility include the 1983 US Embassy Bombing in Beirut, the hijack of TWA Flight 847 in 1985 and the 1992 Israeli Embassy attack in Buenos Aires.

Hezbollah claims that its main source of income comes from zakat, or paying alms to the poor. Zakat is one of the five pillars of Islam, and every Muslim must give 2.5% of their wealth, if it is in excess of an annual limit, to those who can receive alms (8 categories of people qualify). These funds are said to be supplemented by donations from Muslims around the world, including charities. Donations are usually collected during gatherings organised by expatriates in these countries, with the funds subsequently remitted to associated organisations and ultimately to Hezbollah. It is claimed that Hezbollah also uses charities and front organisations to conceal its fundraising activities.

A further allegation made by researchers is that Hezbollah allegedly receives substantial funding from Iran, with some analysts estimating that the revenue from this source reaches around US\$200m a year. Syria is also alleged to provide logistical support in the form of banking and other trading avenues. Finally, Hezbollah is apparently heavily supported by wealthy Shiites, some of whose contributions are legally dubious, with several donors being investigated and indicted by enforcement authorities for criminal activities, such as counterfeiting, trading conflict diamonds, and distributing illegal narcotics and pirated software. Conflict diamonds are thought to have provided Hezbollah with a method of transferring money, converting cash into these small and easily transportable commodities. The US Treasury Department has also accused Hezbollah of counterfeiting US currency. The legitimacy of Hezbollah funds therefore remains highly questionable.

While the US has had some success in disrupting the funding of Hezbollah, for example through actions taken against Iranian banks like Bank Saderat and Bank Sepah, ex OFAC Director Adam Szubin has stated in Congressional Testimony that: "one cannot hope to apply effective financial pressure against a group like Hezbollah so long as it maintains massive inflows from a state sponsor of terrorism, in this case the Iranian government."

Today Hezbollah can be considered an organisation of international reach. Its theatre of operations includes Europe, North and South America, East Asia, and other parts of the Middle East. It is also a player in Lebanon's mainstream political arena, holding 11 of 30 cabinet seats within the Lebanese government since a national unity government was established in 2008, as well as broadcasting its own radio and satellite television stations.

As recently as 30 January 2013 Hezbollah has returned to centre-stage in the political relations of the Middle East following an Israeli air strike on a convoy believed to be transporting anti-aircraft weapons from Syria to Hezbollah.

Iraq

The region of Iraq was historically known as Mesopotamia (Greek: "between the rivers") and home to the world's first known civilization, the Sumerian culture, followed by the Akkadian, Babylonian, and Assyrian cultures, whose influence extended into neighboring regions as early as 5000

BC and are often considered as the "Cradle of Civilization". Whilst the region was conquered from both West (Alexander the Great) and East (the Parthians), the Mongols it was the Ottomans who took Baghdad from the Persians, until the loss of their empire at the end of the first world war. The British were given the mandate for the region, initially combining two regions, Baghdad, and Basra into a single country in 1921 and in 1926, adding Mosul in the north, forming the territorial boundaries of the modern Iraqi state.

Britain granted independence to Iraq in 1932, under the rule of King Faisal, a Hashemite king. The Hashemite Kings would rule with selected Sunni support until a military coup in 1958 toppled the regime. Whilst the new military looked to the Soviet Union for support, the regime was itself toppled in another coup in 1968 this time by the Arab Socialist Baath Party. This movement eventually gradually came under the control of Saddam Hussein in 1979 who assumed the Presidency, leading to 25 years of calamitous rule, including the Iran Iraq war, use of chemical weapons, major abuses against kurdish and shia in Iraq, the invasion of Kuwait, the bombing of Israel, the ejection from Kuwait, the supporting of terrorism and his weapons of mass destruction programmes being the most notable ending in his downfall following the US led invasion in 2003. In December, 2006 after being found and tried he was hanged and killed, a fate which would come to many of his closest supporters. The power vacuum and the violence that predates the fall of Saddam Hussein, led to bloodletting and many atrocities, including a violent insurgency, that included not only local actors but also regional and international ones. Immediately Al-Qaeda took advantage of the insurgency to entrench itself in the country concurrently with an Arab-Sunni led insurgency and sectarian violence, establishing its affiliate Al-Qaeda in the land of the two rivers or AQ in Iraq, which produced splinter groups including the Abdullah Azzad Shaheed Brigades and other Sunni and Kurdish insurgency groups such as Jaish Ansar al-Sunna and Ansar al-Islam and in response Shia groups such as Khata'ib Hezbollah. In 2005, more than 63% of eligible Iraqis came out across the country with 78% voting in favour a new constitution. The new constitution had overwhelming backing among the Shia and

Kurdish communities, but was overwhelmingly rejected by Arab Sunnis. Under the terms of the constitution, the country conducted fresh nationwide parliamentary elections on December 15 to elect a new government. The overwhelming majority of all three major ethnic groups in Iraq voted along ethnic lines, turning this vote into more of an ethnic census than a competitive election. Iraq continues to be divided largely on ethnic lines, with Iraqi politicians and civilians alike under significant threat by the various factions that continue to promote violence as a political weapon. The ongoing violence in Iraq has been incited by an amalgam of religious extremists that believe an Islamic Caliphate should rule, old sectarian regime members that had ruled under Saddam that want back the power they had, and Iraqi nationalists and Kurdish separatists.

Before the fall of Saddam Hussein in 2003, the Ba'ath Party officially ruled as a Sunni minority. The current Prime Minister of Iraq is Nouri al-Maliki, who heads a government that is mainly supported by the majority Shia populace. Maliki was re-elected in 2010. It has been estimated that the number of deaths caused as a result of the Iraq war and its bloody aftermath, are at least 100,000 with other estimates putting the figure as high as half a million. Terrorists are active in Iraq, being placed 3rd by Maplecroft of at risk countries for the likelihood of a terrorist attack ahead of Afghanistan and South Sudan and before Somalia and Pakistan. According to the Global Terrorism Database of terrorist fatalities and incidents since 1970 Iraq tops the list with 17,754 ahead of Sri Lanka and India and Iraq is also the 7th most attacked Country by terrorists. For more details see Part 1 Section 1 Terrorism Finance above.

Iraq's economy is primarily cash-based and whilst narcotics trafficking and narcotics-based money laundering are not major problems, smuggling is endemic, often involving consumer goods, cigarettes, and petroleum products. Bulk cash smuggling, trafficking in persons, and intellectual property rights violations are also concerns. Ransoms from kidnappings and extortion are often used to finance terrorist and criminal networks. Credible reports of counterfeiting exist. Trade-based money laundering, customs fraud, and other forms of value transfer allow criminal organisations the opportunity to earn, move and store supporting funds and illicit proceeds under the guise of legitimate trade. Hawala networks, both licensed and unlicensed, are widely used for legitimate as well as illicit purposes. Corruption is also a major challenge.

According to Transparency International in 2013, Iraq's is the most corrupt government in the Middle East with a rating of 171 out of 175. The 2011 report "Costs of War" from Brown University's Watson Institute for International Studies concluded that U.S. military presence in Iraq has not been able to prevent this corruption, noting that as early as 2006, "there were clear signs that post-Saddam Iraq was not going to be the linchpin for a new democratic Middle East."

Special Focus 6

Al-Qaeda Organisation in the Land of the Two Rivers / Al-Qaeda in Iraq

Tanzim Qa'idat al-Jihad Fi Bilad al-Rafidayn is the current name of the terrorist group Jama'at al-Tawhid Wa'al-Jihad, formerly led by Abu Musab Zarqawi. The US State Department has understood this new name, which is translated as the Al-Qaeda Organisation in the Land of the

Two Rivers, to imply that Zarqawi saw his group as the centre of Jihadist activities in Iraq. This change was made after Zarqawi formally pledged his alliance to Al-Qaeda in a letter addressed to Osama bin Laden recovered by Coalition forces in 2004.¹²

Despite the change in name, the letter makes it clear that the goals of Zarqawi's group, to overthrow the interim Iraqi government and establish an Islamic state in Iraq by forcing out the US-led coalition, remain constant. AQI is believed to be comprised of foreign terrorists, elements of the Kurdish Islamist group Ansar al-Islam, and indigenous Sunni Iraqis.

The group issues claims of responsibility regularly in Iraq for attacks on American and Iraqi security forces, often claiming several attacks in one day. The AQI uses a variety of tactics that include RPG attacks against armoured vehicles, guerrilla style attacks by armed militants, suicide bombings, and the kidnapping and beheadings of foreigners.

A video released in May 2004 gained notoriety for depicting Zarqawi brutally beheading Nicholas Berg, an American civilian contractor in Iraq. However, the group has increasingly eschewed such tactics since Zarqawi swore allegiance with Al-Qaeda. Instead, AQI, which is believed to derive most of its domestic support from Sunni Arabs, targets (in order of priority) Shiite Arabs, who are seen as pro-American betrayers of the true faith, Coalition forces and their local support, including the Iraqi security forces, and Kurds, who are perceived to act as a "Trojan Horse" for Jewish economic infiltration into Iraq.

In addition to frequent smaller scale attacks in Iraq, the group claimed responsibility for the bombing of three hotels in Amman, Jordan that left 67 people dead and injured more than 150. A stern rebuke issued by Al-

Qaeda number two, Ayman al-Zawahiri, shortly after the attack seems to have stopped the selection of targets outside of Iraq.

Zarqawi's letter to bin Laden revealed many problems that the former believed AQI would face in the coming years. The Sunni insurgent leader pointed out that as American forces are drawn down or removed from the front lines and indigenous Iraqi forces take their place, attacks perpetrated against security forces will increasingly be seen as anti-Iraqi attacks, rather than anti-occupation ones. Zarqawi confessed that his fighters' freedom of movement had become increasingly restricted and that the "future has become frightening".

According to Zarqawi the local Sunni Iraqi resistance was inexperienced and unwilling to sacrifice for the cause, whereas battle-tested foreign Mujahideen were too small in number to affect significant change. Zarqawi went on to complain that the Sunni Iraqi masses have "no firm principles" and that "their religion is mercurial". Additionally, the letter illuminated a strategic plan for victory, despite these odds. Importantly, Zarqawi highlighted the importance of the information warfare campaign, stating that the "pen and the sword complement each other". He targeted the Shia as the main enemy, hoping to incite sectarian strife and thus provoke the Sunni "silent majority" into armed action in the ultimate battle for the future of Islam.

In a speech broadcast over the internet on 23 January 2005, Zarqawi denounced the upcoming Iraqi elections, calling candidates "demi-idols" and voters "infidels." Zarqawi's statement, declaring a "fierce war" against democracy, accused the Americans of rigging the election in favour of Iraq's Shi'ite population. Increased Sunni Arab participation in Iraq's December 2005 parliamentary elections offered hope to some that support for wider insurgency may be abating. However, violence resumed following a lull in attacks during the election, including attacks by AQI. In January 2006, the group was one of six insurgent organisations to unify under the Mujahideen Shura Council. For a time all attacks perpetrated by AQI were claimed in the name of the Council. Zarqawi himself was killed in a US air strike in June 2006, and until 2010 his successor as head of operations in Iraq was Abu Ayub al-Masri. In October of 2006 al-Masri openly expressed his intention to establish a new caliphate in the region by declaring the 'Islamic State of Iraq' and began to use this as the pseudonym under which to claim attacks perpetrated by AQI. In 2010 al-Masri, along with fellow senior leader al-Baghdadi, were killed in a raid and subsequently replaced by Abu Baker al-Baghdadi al-Husseini al-Qurashi and Abu Ibrahim al-Issawi as the organisation's leaders. The months between March and May of 2010 represented a period in which the organisation suffered considerable losses, with Iraqi and US security forces capturing or killing 34 of 42 senior leaders.

In the years following 2010 AQI has continued to use

violent strikes in an attempt to incite large-scale sectarian violence, however this is an end in which it has been largely unsuccessful. Rather Sunni leaders have agreed to participate in the political process alongside Shi'ite Muslims, and two democratic elections have taken place. Nonetheless the organisation has not dwindled into obscurity, in 2011 it was estimated that the group had between 1000 and 2000 members. While the majority of its attacks are conducted in Iraq, AQI has also undertaken operations in neighbouring Jordan.

More recently the organisation has expanded to join the fight in neighbouring Syria, under the umbrella group known as The Islamic State of Iraq and Syria (ISIS) also known as The Islamic State of Iraq and the Levant.

Abdullah Azzam Shaeed Brigades - Iraq

The Abdullah Azzam Brigades was formed as an off-shoot of AQI in 2009 with local networks in countries across the Middle East, mostly in the Levant area including Jordan, and is named after Sheikh Abdullah Azzam, a Palestinian from Jordan who was among the first arabs to volunteer to join the Afghan Jihad. The Lebanese branch is called the Ziad al-Jarrahd Battalion.

Ansar al-Islam (AI)/AQ Kurdish Battallions - Iraq

Ansar al-Islam was designated as a US Foreign Terrorist Organisation on 22 March 2004, Ansar al-Islam's goals include expelling the western interests from Iraq and establishing an independent Iraqi state based on Sharia law. AI was established in 2001 in Iraqi Kurdistan with the merger of two Kurdish extremist factions that traced their roots to the Islamic Movement of Kurdistan. On May 4, 2010 Abu Abdullah al-Shafi'i, Ansar al-Islam's leader was captured by US forces in Baghdad and remains in prison. On 15 December 2011 AI announced a new leader, Sheikh Abu Hashim Muhammad bin Abdul Rahman al Ibrahim. AI is now thought to be known as AQ Kurdish Battallions.

AI has conducted attacks against a wide range of targets including the Iraqi government and security forces, and US and Coalition forces. AI has conducted numerous kidnappings, executions, and assassinations of Iraqi citizens and politicians. The group has either claimed responsibility or is believed to be responsible for attacks in 2011 that killed 24 and wounded 147 people. On February 7, AI posted leaflets in Kirkuk warning of an attack on a Kurdish militia in retaliation for the arrest of Muslim women in the city. Two days later, a series of car bombs exploded in Kirkuk, destroying the militia's headquarters and injuring two nearby police patrols. The attack killed ten and wounded 90. On 13 October, 16 civilians and two police officers were killed and 43 others wounded in a double improvised explosive device attack in Baghdad. The group was also responsible for kidnappings in February and December 2011 and more recently.

Jamaat Ansar al-Sunna - Iraq

Formerly Jaish Ansar al-Sunna, this group whose name means "Assembly of the Helpers of Sunnah" is one of the many Iraqi Sunni insurgent groups that is battling the forces of the Shia led Nouri al-Maliki government. The group adheres to mainstream Wahabbism. The group is based in northern and central Iraq, and includes mostly Iraqi (both Sunni Arab and Sunni Kurdish) fighters. The group was founded in September 2003 as an umbrella organisation for guerrillas, with former members of Ansar al-Islam, with members currently residing in Iran after a 2003 joint operation by Iraqi and US forces forced them to flee Iraq. Ansar al-Sunna is thought to have had links with organisations operating in Iraq including, the formerly Abu Musab al-Zarqawi backed, Jama'at al-Tawhid wal-Jihad (Al-Qaeda in Iraq), though has since, with others engaged in violent conduct against AQ in Iraq. In 2007 representatives of the Ansar al-Sunna were instrumental in forming an alliance of Sunni militant groups to prepare for the withdrawal of American and allied forces. The new alliance is composed of seven groupings explicitly excluding Al-Qaeda and the Baath-party. Ansar al-Sunna has claimed responsibility for suicide bombings and kidnap and beheadings in Iraq, including the devastating attacks on the offices of two main Kurdish political parties, KDP and PUK, in Irbil in 2004, that killed at least 109 people.

Khata'ib Hezbollah (KM) - Iraq

Khata'ib Hezbollah was formed in 2006 and is a radical Shia Islamist group with an anti-Western outlook and extremist ideology that has conducted attacks against Iraqi, US, and Coalition targets in Iraq. KH has threatened the lives of Iraqi politicians and civilians that support the legitimate political process in Iraq. The group is notable for its extensive use of media operations and propaganda by filming and releasing videos of attacks. KH has ideological ties to Lebanese Hezbollah and may have received support from that group and its sponsor, Iran. KH has been responsible for numerous violent terrorist attacks since 2007, including improvised explosive device bombings, rocket propelled grenade attacks, and sniper operations. In 2007, KH gained notoriety with attacks on US and Coalition Forces in Iraq. KH was particularly active in the summer of 2008, recording and distributing video footage of its attacks against US and Coalition soldiers. Using the alias "Hezbollah Brigades in Iraq," KH filmed attacks on US Stryker vehicles, Abrams tanks, and Bradley armored personnel carriers. In 2009, KH continued to release videos of attacks ranging in date from 2006 to 2008 on the Internet. In June 2011, five US soldiers were killed in a rocket attack in Baghdad, Iraq, when KH assailants fired between three and five rockets at the US military base Camp Victory, which surrounds Baghdad's International airport. KH is almost entirely dependent on support from Iran and Lebanese Hezbollah. Khata'ib Hezbollah was designated as a US Foreign Terrorist Organisation on 2 July 2009.

Iran

Around 2000 B.C. the Parsua tribe (from which the Persians derive their name) left central Asia in search of greener pastures for their cattle, eventually settling near what is now the Persian Gulf. By around 545 B.C. they had the largest empire on Earth, stretching 3000 miles across to and

including Asia Minor (now Turkey) and ruled over by Cyrus the Great.

Whilst conquering Greece had already been attempted, Xerxes I, in 480 BC tried again. He amassed a great army of hundreds of thousands of warriors, which was one of the largest armies assembled during ancient times. Xerxes initially won the Battle of Thermopylae against much smaller army from Sparta; however, the Greek fleet defeated his navy at the Battle of Salamis and he was eventually forced to retreat. Many historians believe that a Persian victory would have seriously altered World history, negatively affecting the development of Ancient Greece, and by extension western civilization, and this has led to claims that Salamis was one of the most significant battles of all times. Notwithstanding this defeat, the Persian Empire continued to dominate the area until around 334 B.C. when they were conquered by the Macedonian general Alexander The Great.

In succeeding centuries, Persia was invaded by the Parthians, the Arabs, the Mongols and various Turkish dynasties. After the Arab conquest in the middle of the 7th century, Islam became the dominant religion, and as a result of rule by one of the Turkish dynasties in the 16th Century, the Shiite branch of Islam became the official religion on Persia. The Persians fought against the Ottomans and once more established themselves as a major power. After the first World War in 1921, Reza Khan Pahlavi an army officer, established a military dictatorship and made himself a hereditary Shah, and ruler of a country that had recently discovered oil. He was followed after the second world war by his son Mohammad Reza Pahlavi. The new Shah introduced the White Revolution, a series of economic, social and political reforms with the proclaimed intention of transforming Iran into a global power and modernizing the nation by nationalizing certain industries and granting women suffrage.

In response, conservative clerical forces led by Ayatollah Khomeini in 1963 revolted and opposed the Shah. Whilst Khomeini and the Islamists would be put down at this time they would succeed later in 1979 when the Shah was forced into exile and following the Iranian

Revolution, clerical forces led by Ayatollah Khomeini, established a theocratic system of government with ultimate political authority vested in a learned religious scholar referred to commonly as the Supreme Leader who, today is Khomeini's successor, namely, Ayatollah Khamenei.

US-Iranian relations became strained when a group of Iranian students seized the US Embassy in Tehran in 1979 and held embassy personnel hostages until early 1981. The US cut off diplomatic relations with Iran in 1980. During the period 1980-88, Iran fought a bloody, indecisive war with Iraq.

Iran has been designated by the US as a state sponsor of terrorism for its activities in Lebanon and elsewhere in the world and remains subject to US, UN, and EU economic sanctions and export controls because of its continued involvement in terrorism and its nuclear weapons ambitions.

In 1984, the US designated Iran as a state sponsor of terror, due to its continued support to multiple terrorist organisations, including Hezbollah and the Palestinian Islamic Jihad (PIJ). In 2011, the U.S. Government identified Iran as a state of primary money laundering concern and in 2012, the FATF urged jurisdictions around the world to impose countermeasures to protect their financial sectors from illicit finance emanating from Iran. Iran is known to use its state-owned banks to channel funds to terrorist organisations and finance its nuclear and ballistic missile programmes.

The US has designated at least 20 Iranian banks and subsidiaries under counter-proliferation and terrorism authorities. Iran is subject to US, UN, and EU economic sanctions and export controls because of its continued involvement in terrorism and its nuclear weapons ambitions. Iran is a presumed source, transit, and destination country for men, women, and children subjected to sex trafficking and forced labour.

In a move that may enable reformers to come to the fore and after eight acrimonious years under former President Ahmadinejad, 2013 elections saw the moderate cleric Hassan Rouhani gain power.

Rouhani, a PhD graduate from Glasgow Caledonian University and a former nuclear negotiator, has pledged to find a way out of the current stalemate over Iran's nuclear programme, and to have lifted international sanctions against the country.

Nevertheless hardliners remain in control of key aspects of Iran's political system, not least the continued leadership of the country by the Supreme leader Ayatollah Khomeini.

Despite substantial interdiction efforts and considerable control measures along the border with Afghanistan, Iran remains one of the primary transshipment routes

for Southwest Asian heroin to Europe and as a result suffers one of the highest opiate addiction rates in the world, and has an increasing problem with synthetic drugs. Iran's merchant community makes active use of money and value transfer systems, including hawala and moneylenders. Many hawaladars and traditional bazaaris are linked directly to the regional hawala hub in Dubai. Over 300,000 Iranians reside in Dubai, with more than 8,000 Iranian-owned companies based there. Iran is ranked 133 out of 174 countries listed in Transparency International's 2012 Corruption Perception Index. There is pervasive corruption within the ruling and religious elite, government ministries, and government-controlled business enterprises.

Islamic Revolutionary Guards Corps - Iran

The Islamic Revolutionary Guard Corps (IRGC) was formed by late supreme leader Ayatollah Khomeini in the wake of the 1979 Islamic Revolution that ousted Shah Reza Pahlavi. The country's premier security institution of more than 100,000 strong, the IRGC is charged with defending the Islamic Republic against internal and external threats. The IRGC fields an army, navy, and air force, while managing Iran's ballistic missile arsenal and irregular warfare operations through its elite Quds Force. The Quds Force has supported terrorist activities and armed pro-Iranian militant groups across the Middle-East and beyond, including in Lebanon, most notably Hezbollah, the Palestinian territories, Iraq, Afghanistan, the Gulf states, and elsewhere including most recently providing weapons and other material support to help President Bashar al-Assad suppress the uprising in Syria.

The Guards also control Iran's Basij Resistance Force, an all-volunteer paramilitary wing, which consists of as many as one million conscripts. Whilst the IRGC have political and military authority, they also have a significant financial clout, including control of a number of Bonyads. The Los Angeles Times estimated in 2007 that the group, which was tasked with rebuilding the country after the Iran-Iraq war, now has ties to more than one hundred companies that control roughly US\$12bio in construction and engineering capital. Critical to the success of the IRGC in providing sufficient funding sources are Iranian Bonyads which make up to approximately 30% of Iran's GDP. Bonyads are tax-exempt charitable entities. Comprising well over 120 semi-state tax-exempt monetary foundations, Bonyads have been in existence for a long time. Founded as royal foundations by the Shah the original Bonyads were criticised for providing a "smokescreen of charity" to patronage, economic control, for-profit wheeling and dealing done with the goal of "keep[ing] the Shah in Power."

After the 1979 revolution, the Bonyads were nationalized and the assets of many Iranians whose ideas or social positions ran contrary to the new Islamic government were also confiscated and given to the Bonyads. The largest of today's Bonyads is likely the "Foundation of the Oppressed and Disabled," which is the

principal holder of assets seized from the Shah and is sometimes referred to as the "government within the government." This Bonyad has been run by hardliners and former officials of the IRGC. In 1982, the foundation owned 203 manufacturing and industrial factories, 472 large farms, 101 construction firms, and 238 trade and service companies. In the past two decades it has used these already large assets to expand its activities into all areas of the economy, including manufacturing, commerce, banking, tourism, and telecommunications. This Bonyad is long suspected also of being involved in procuring weapons of mass destruction (WMD) as well as the illegal importation of alcohol.

Mujahadin-e Khalq (MEK) - Iran

The Mujahadin-E Khalq Organisation (MEK) is a Marxist-Islamic Organisation that seeks the overthrow of the Iranian regime through its military wing, the National Liberation Army (NLA), and its political front, the National Council of Resistance of Iran (NCRI). The MEK was founded in 1963 by college-educated Iranian Marxists who opposed the country's pro-western ruler, Shah Reza Pahlavi. The group participated in the 1979 Islamic Revolution that replaced the Shah with a Shiite Islamist regime led by Ayatollah Khomeini. However, the MEK's ideology, a blend of Marxism, feminism, and Islamism, was at odds with the post-revolutionary government, and its leadership was soon executed by the Khomeini regime. In 1981, the group resettled in Paris, where it began supporting Iraq in its eight-year war against Khomeini's Iran. In 1986, after France recognised the Iranian regime, the MEK moved its headquarters to Iraq, which facilitated its terrorist activities in Iran. From 2003 through the end of 2011, roughly 3,400 MEK members were encamped at Ashraf in Iraq. Before Operation Iraqi Freedom began in 2003, the MEK received all of its military assistance and most of its financial support from Saddam Hussein, and since the MEK increasingly has to rely on front organisations to solicit contributions from expatriate Iranian communities.

Jundallah - Iran/Baluchestan

Since its 2003 inception, Jundallah, a violent extremist organisation that operates primarily in the province of Balochistan of Iran, as well as the greater Baluchestan area of Afghanistan has engaged in numerous attacks and killings of Iranian civilians and government officials. Jundallah wants to secure recognition of Baluchi rights from Iran and to spread awareness of the Baluchi situation through violent and non-violent means. A 2009 suicide bomb attack in a marketplace in Pishin in the Sistan and Baluchestan Province killed more than 40 people, was reportedly the deadliest terrorist attack in Iran since the 1980s. In 2010 a suicide bomb attack inside the Imam Hussein Mosque in Chabahar killed an estimated 35 to 40 civilians and wounded 60 to 100. In July 2010, Jundallah attacked the Grand Mosque in Zahedan, killing approximately 30 and injuring an estimated 300.

Gulf States

The Gulf States are those Arab states bordering the Persian Gulf, being Kuwait, Bahrain, Oman, Qatar, Saudi Arabia and United Arab Emirates, all part of the Gulf Cooperation Council. All of these Arab states have significant revenues from oil and gas and, with the exception of Saudi Arabia,

have small local populations. Other states also border the Gulf including Iran and Iraq though these are less described as Gulf States and more regional powers within the wider middle east. The Gulf States, and their ruling families are predominantly Sunni Islamic, with Bahrain, the one outlier with the majority being Shiite versus the minority Sunni, though with a Sunni ruling family. Whilst other Bordering nations Iraq and Iran are not considered pure Gulf States, both are Shia Islamic dominated, though under Saddam Hussein the Sunni minority ruled. Conversely in Syria, the ruling class under President Bashar al-Assad are the Alawites a sect which is an offshoot religion of Shiite Islam, in a majority-Sunni country. Whilst Iran supports much of the Shia in the region, the Sunnis are supported by the Gulf States and on this axis much can be explained. For example, the rebels trying to topple Bashir al-Assad are receiving military and political support from majority-Sunni Saudi Arabia, UAE, Kuwait, Bahrain and Qatar.

This rivalry between Shia and Sunni, in particular between the main regional powers Iran and Saudi Arabia has even spread to the naming of the Gulf region itself. For Centuries the name of the gulf, has been known as the Persian Gulf after the land of Persia (Iran), but is since the 1960s, being challenged by the naming of the area as the Arabian Gulf. Whatever the name it is a very important waterway, especially one that is necessary to ensure the continued flow from the region of Oil.

United Arab Emirates

The United Arab Emirates (UAE) is situated in the Southeast of the Arabian Peninsula, bordering Oman and Saudi Arabia. In December 1971, the UAE became a federation of six emirates, Abu Dhabi, Dubai, Sharjah, Ajman, Umm al-Quwain, and Fujairah, while the emirate of Ras Al Khaimah joined the federation in 1972. The capital city is Abu Dhabi, located in the largest and wealthiest of the seven emirates.

Since its Federation in 1971, the UAE has developed rapidly and is now noted for its modern infrastructure, international events and status as a trade and transport

hub. The President of the UAE is His Highness (HH) Sheikh Khalifa bin Zayed Al-Nahyan, who is also Ruler of Abu Dhabi Emirate. The Ruler of Dubai Emirate, HH Sheikh Mohammed bin Rashid Al-Maktoum, is the Vice-President, Prime Minister and Defence Minister. The UAE is the Middle East's second largest economy after Saudi Arabia and one of the wealthiest countries in the region on a per capita basis.

A significant portion of the money laundering activity in the UAE is likely related to proceeds from illegal narcotics produced in South West Asia. Narcotics traffickers from Afghanistan, where most of the world's opium is produced, are increasingly reported to be attracted to the UAE's financial and trade centers. Domestic public corruption contributes little to money laundering or terrorist financing. Regional hawalas and associated trading companies in various expatriate communities, most notably the Somalis, have established clearinghouses, the vast majority of which are not registered with the UAE government. Likewise, the UAE's proximity to Somalia has generated reports suggesting some influx and/or transit of funds derived from piracy. There are some indications that trade based money laundering occurs in the UAE and that such activity might support terrorist groups in Afghanistan, Pakistan and Somalia. Other money laundering vulnerabilities in the UAE include exploitation of cash couriers, the real estate sector, and the misuse of the international gold and diamond trade. The Emirates also have an extensive offshore financial center.

Saudi Arabia

The Region of Arabia had been ruled by a patchwork of tribal rulers, for centuries, is the birthplace of Islam and home to Islam's two holiest shrines in Mecca and Medina and was for many centuries under the overall control of the Ottoman Empire. The modern Saudi state was founded in 1932 by Ibn Saud after a 30-year campaign to unify most of the Arabian Peninsula. The conquests which eventually led to the creation of the Kingdom began in 1902 when Ibn Saud captured Riyadh, the ancestral home of his family, the House of Saud, or Al Saud and with British support during World War 1 was able to consolidate Arabia into what is today Saudi Arabia. Ibn Saud received support and formed a long alliance with the followers of 18th Century Imam, Muhammad ibn Abd al-Wahhab, who founded Wahhabism, considered an ultra-conservative branch or sect of Sunni Islam with an aspiration to return to the earliest fundamental Islamic sources of the Quran, without speculative philosophy so as to not transgress beyond the limits of the early Muslims known as the Salaf. The Al Saud regime has been an absolute monarchy since its inception and current King Abdullah is a descendant as is required under the constitution. The king's official title is the Custodian of the Two Holy Mosques, which recognises the importance of religion in Saudi Arabia and to Muslims worldwide. The form of Islam practiced

in Saudi Arabia is influenced by Wahhabism and a result of the early and long lasting alliance between the House of Saud and the followers of Wahhabism. The Wahhabism movement gained unchallenged precedence in the Arabian peninsula through this alliance and with enormous financial support. The Saudi government established the Commission for the Promotion of Virtue and Prevention of Vice, a state religious police unit, to enforce religiously Wahhabi rules of behaviour. Since the 1970s it is estimated that the Saudi government had spent at least US\$87bio propagating Wahhabism abroad, the bulk of this funding going towards the construction and operating expenses of mosques, madrasas and other religious institutions and teachings that preach Wahhabism.

Saudi Arabia is bordered by Jordan and Iraq to the north, Kuwait to the northeast, Qatar, Bahrain and the United Arab Emirates to the east, Oman to the southeast, Yemen in the south, the Red Sea to the west and Persian Gulf to the east. Its population is estimated to consist of 16 million citizens and an additional 9 million registered foreign expatriates and 2 million illegal immigrants. Saudi Arabia has the world's second largest oil reserves and the world's sixth largest natural gas reserves, which account for more than 95% of exports and 70% of government revenue. This has facilitated the transformation of the underdeveloped desert kingdom into one of the world's wealthiest nations, and as one of the 20 most powerful countries in the world. It is considered a regional power, dominating in the Arabian peninsula and competing with Iran and Egypt in the wider Arab Community for leadership status. Saudi Arabia is a growing financial center in the Gulf Region.

With a large expatriate labour community and a predominantly cash-based society, it is susceptible to money laundering and terrorist financing originating from Saudi criminal enterprises, private individuals, and Saudi-based charities. Saudi bulk cash smuggling from individual donor and charities has reportedly been a major source of financing to extremist and terrorist groups over the past 25 years. As one way of addressing the potential diversion of charitable giving, the Saudi government has attempted to consolidate charitable campaigns under Ministry of Interior supervision. With the advent of tighter bank regulations, funds are reportedly collected and illicitly transferred in cash, often via pilgrims performing Hajj or Umrah. Saudi Arabia is a destination country for men and women subjected to forced labour and, to a lesser extent, forced prostitution and men and women from many South And South East Asia Countries voluntarily travel to Saudi Arabia as domestic servants or other low-skilled labourers, but some subsequently face conditions indicative of involuntary servitude. Underground remittance systems such as hawala are also present in Saudi Arabia and have been used to finance terrorism.

Despite serious and effective efforts to counter the funding of terrorism originating from within its borders,

and from branches and offices of entities funded from or controlled Saudi Arabia, for example see Terrorism Financiers in Part 2, Section 7 Cases/Criminals below. Saudi Arabia continues to serve as an important source of funds flowing to Sunni-based extremist groups, through individual sponsored donations from sympathizers and supporters. The major domestic terrorist threat comes from Al-Qaeda in the Arabian Peninsula, with incidents such as the Khobar Towers bombing in 1996, the Riyadh Compound bombings in 2003 and the Khobar Massacre in 2004. Attacks have also been carried out by AQAP in neighboring Yemen also including the bombing of the USS Cole in 2000, which foreshadowed the 2001 attacks on America, carried out by largely Saudi citizens and led by Saudi Citizen Osama bin Laden's Al-Qaeda.

Yemen

North Yemen became independent after defeat of the Ottoman Empire in 1918 after the first World War. In South Yemen, the British only withdrew in 1967. The two countries were formally unified as the Republic of Yemen in 1990. A brief civil war in 1994 and fighting in 2004 between the government and rebels seeking a return to traditional Islam ended in early 2010 with a ceasefire that continues to hold. Public rallies starting in January 2011 in the capital Sana'a against then President Salih inspired by similar demonstrations in Tunisia and Egypt, as part of the so called Arab Spring. These led, by November 2011, to Salih stepping down and transferring his powers to Vice President Abd Rabuh Mansur Hadi, who stood for and won subsequent elections in 2012. Government corruption, a largely cash-based economy and lax government enforcement of existing laws and regulations render Yemen vulnerable to money laundering and other financial abuses, including possible terrorist financing. Yemen has a large underground economy due, in part, to the profitability of the smuggling of trade goods and contraband. Criminal proceeds in Yemen tend to emanate from foreign criminal activity, including smuggling by criminal networks, and, possibly, terrorist groups, including Al-Qaeda in the Arabian Peninsula. There is also evidence that khat is smuggled from Yemen as well as from East Africa into Western Europe and the US with profits laundered and repatriated via hawala networks.

Transparency International lists Yemen as 167 out of 175 on its 2013 Corruption Perception Index. Yemen is included in the October 2012 Financial Action Task Force (FATF) Public Statement because it has not made sufficient progress in implementing its action plan and continues to have certain strategic anti-money laundering/counter-terrorist financing deficiencies, including the inadequate criminalization of money laundering and terrorist financing, the inability to freeze terrorist assets, and the lack of capacity of supervisory entities and the financial intelligence unit.

Special Focus 7

Al-Qaeda in the Arabian Peninsula - Saudi/Yemen

Al-Qaeda in the Arabian Peninsula (AQAP) is a militant Islamist organisation, primarily active in Yemen and Saudi Arabia, and acts as an affiliate of Al-Qaeda. Like Al-Qaeda, it opposes the Al Saud monarchy. AQAP was formed in January 2009 from a merger of al-Qaeda's Yemeni and Saudi branches.

The Saudi group had been effectively suppressed by the Saudi government, forcing its members to seek sanctuary in Yemen. It is believed to have several hundred members. Osama bin Laden was a Saudi citizen whose father was born in Yemen. It is considered the most active of Al-Qaeda's branches, or "franchises," that emerged due to weakening central leadership.

According to US counter-terrorism officials, Anwar al-Awlaki¹² was the main force behind AQAP's decision to transform itself from a regional threat into Al-Qaeda's most active affiliate outside Pakistan and Afghanistan. The percentage of terrorist plots in the West that originated from Pakistan declined considerably from most of them (at the outset), to 75% in 2007, and to 50% in 2010, as Al-Qaeda shifted to Somalia and Yemen.

US Secretary of State Hillary Clinton formally designated AQAP a terrorist organisation on December 14, 2009. On August 25, 2010, The Washington Post said the CIA believed Yemen's branch of Al-Qaeda had surpassed its parent organisation, Osama bin Laden's core group, as a threat to the US homeland.¹³

AQAP was responsible for the USS Cole bombing in October 2000 in the southern port of Aden, killing 17 US sailors. The Aden-Yemeni Islamic Army was also believed to have been involved in this attack. In 2002, an AQAP attack damaged a French supertanker in the Gulf of Aden. The Global Terrorism Database attributes the 2004 Khobar massacre also to the group. An attack in 2008 on the US Embassy in Yemen killed 19 and was claimed by an AQ affiliate, the Islamic Jihad of Yemen. Abdulhakim Mujahid Muhammad, formerly known as Carlos Leon Bledsoe, a Muslim convert who had spent time in Yemen, opened fire in 2009 with an assault rifle in a drive-by shooting on soldiers in front of a US military recruiting office in Little Rock, Arkansas, US in a jihad attack. He killed Private William Long, and wounded Private Quinton Ezeagwula. He said that he was affiliated with and had been sent by AQAP.

In August 2009, an AQAP suicide bomber tried to kill Prince Mohammed bin Nayef, who heads Saudi Arabia's anti-terrorism campaign and is a member of the Saudi royal family. In 2009, AQAP also carried out a suicide attack in Yemen that killed four South Korean tourists. AQAP said it was responsible for attempted bombing on North West Airlines Flight 253 as it approached Detroit on 25 December 2009. In that incident, Umar Farouk Abdulmutallab reportedly tried to set off plastic explosives sewn to his underwear, but failed to detonate them properly.

On February 8, 2010, deputy leader Said Ali al-Shihri called for a regional holy war and blockade of the Red Sea to prevent shipments to Israel. In an audiotape he called upon Somalia's al-Shabaab militant group for assistance in the blockade. The 2010 cargo plane bomb plot was discovered on October 29, 2010, when two explosive-laden packages bound for the US via cargo planes were found, based on intelligence received from government intelligence agencies, in the UK and the United Arab Emirates.

In November 2010 the group announced a strategy, called "Operation Hemorrhage", that it said was designed to capitalize on the "security phobia that is sweeping America." The programme would call for a large number of inexpensive, small-scale attacks against US interests with the intent of weakening the US economy.

On 21 May 2012, a soldier wearing a belt of explosives carried out a suicide attack on military personnel preparing for a parade rehearsal for Yemen's Unity Day. With over 120 people dead and 200 more injured, the attack was the deadliest in Yemeni history. AQAP claimed responsibility for the attack.

During the June 2012 Al-Qaeda retreat from key southern Yemeni stronghold, the organisation planted land mines, which killed 73 civilians. According to the governor's office in Abyan province, 3,000 mines were removed from around Zinbar and Jaar. Also in 2012 a funeral service was attacked in Yemen killing 45.

Ansar al-Sharia - Yemen

In the wake of the 2011 Yemeni revolution, an Islamist insurgent organisation called Ansar al-Sharia (supporters of Islamic Law), emerged in Yemen and began to seize control of areas in the Abyan Governorate and surrounding areas and declaring them an Islamic emirate. There was heavy fighting with the Yemeni security forces over the control of these territories, with Ansar al-Sharia driven out of most of their territory over 2012. In October 2012, the UN and the US designated Ansar al-Sharia (Yemen) as an alias for AQAP. The State Department described the establishment of Ansar al-Sharia (Yemen) as an attempt to attract followers in areas of Yemen where AQAP had been able to establish territorial control and implement its interpretation of Sharia.

Egypt

Egypt is a country spanning the northeast corner of Africa and southwest corner of Asia across the Sinai Peninsula. Most of its territory lies within North Africa and is bordered by the Mediterranean Sea to the north, the Gaza Strip and Israel to the northeast, the Gulf of Aqaba to the east,

the Red Sea to the east and south, Sudan to the south and Libya to the west. Egypt is the 15th most populated country in the world, with the great majority of its over 84 million people living near the banks of the Nile River. The English name Egypt is derived from the ancient Greek Agyptos via Middle French Egypte and Latin Aegyptus.

Egypt has one of the longest histories of any modern state, having been continuously inhabited since the 10th millennium BC. A unified kingdom arose circa 3200 B.C., and a series of dynasties ruled in Egypt for the next three millennia. The last native dynasty fell to the Persians in 341 B.C., who in turn were replaced by the Greeks, Romans, and Byzantines. It was the Arabs who introduced Islam and the Arabic language in the 7th century and who ruled for the next six centuries. A local military caste, the Mamluks took control about 1250 and continued to govern after the conquest of Egypt by the Ottoman Turks in 1517. Completion of the Suez Canal in 1869 elevated Egypt as an important world transportation hub. Ostensibly to protect its investments, Britain seized control of Egypt's government in 1882, but nominal allegiance to the Ottoman Empire continued until 1914. Partially independent from the UK in 1922, Egypt acquired full sovereignty from Britain in 1952. Egypt united with Syria in 1958 under nationalist leader Gamal Nasser but this lasted only until 1961.

A rapidly growing population (the largest in the Arab world), limited arable land, and dependence on the Nile all continue to overtax resources and stress society. The government has struggled to meet the demands of Egypt's population through economic reform and massive investment in communications and physical infrastructure. Inspired by the 2010 Tunisian revolution, Egyptian opposition groups led demonstrations and labour strikes countrywide, culminating in President Hosni Mubarak's ouster. Egypt's military assumed national leadership until a new parliament was in place in early 2012. That same year, Mohammed Mursi representing the Muslim Brotherhood won the Presidential election and a new constitution was affirmed. In July 2013, the military ousted Mursi and he was replaced by interim President Adly Mansour.

Muslim Brotherhood - Egypt

A widespread Islamist organisation founded in 1928 in Egypt, the Brotherhood seeks to Islamise societies from the ground up and compel governments in Muslim countries to adhere to sharia, or Islamic law. At various times in its history, the group has used or supported violence and has been repeatedly banned in Egypt for attempting to overthrow the government. Since the 1970s, however, the Egyptian Brotherhood disavowed violence and sought to participate in Egyptian politics, finally coming to power following the recent Egyptian revolution that flowed from the Arab Spring, but also being ousted by the Egyptian Army supported by much of the population following a partisan and unpopular Presidency. The US and European governments do not include the group on its list of terrorist organisations, although Russia does. There are new calls to include the Brotherhood due to its response to its ousting, though the politics and actions of the Army and their response is still being debated. In the past, whilst the Brotherhood maintained its non-violent approach, and built a network of branches in over 70 countries, some terrorist groups—including Hamas, Jamaat al-Islamiyya, and Al-Qaeda—have historic and ideological affiliations with the Brotherhood. In addition, some of the world's most dangerous terrorists were once Egyptian Muslim Brotherhood members, including Osama bin Laden's deputy and now head of AQ al-Zawahiri.

Egyptian Islamic Jihad (EIJ) - Egypt

The Egyptian Islamic Jihad is a terrorist organisation that has been active since the late 1970s, during which time it has been known by a multitude of names including the Islamic Group, Al-Jihad al-Islami, the Jihad Group, and the Vanguards of Conquest. The initial goal of the organisation was to establish in Egypt an Islamic state, however the group's objectives expanded to include resisting, and actively targeting any Western influences in the Middle East. This latter endeavour led the EIJ to attack Israeli and American targets, both within Egypt and abroad. Following the incarceration of many EIJ members by Egyptian security forces in the 1980s the group split into two factions, one led by Abdul al-Zumar, the other led by the rising figure of Al-Zawahiri. Al-Zawahiri entered the public consciousness during his period of imprisonment, emerging as a passionate speaker condemning the treatment of prisoners and extolling the virtues of a "true" Islamic state.

While Zumar's faction dwindled into obscurity, the al-Zawahiri faction prospered. Significantly, since 1998 the EIJ has merged with Al-Qaeda and according to many researchers played a pivotal role in the selection of the World Trade Centre and the Pentagon as targets for the 2001 attacks. The link between the two organisations is not however a new phenomenon. EIJ moved their headquarters to Afghanistan following Al-Zawahiri's release from prison in 1984. From here the EIJ recruited many Afghan militants who would be trained in Mujahideen camps, before returning to undertake terrorist operations in Egypt. It is also worth noting that Al-Zawahiri's

EIJ militants, many of whom were young doctors and engineers, provided Al-Qaeda with a great deal of their expert knowledge and carved a name for themselves amongst the Afghan Arabs as the “thinkers and the brains”.

The transition into the Al-Qaeda led war against ‘Jews and Crusaders’ has not however been at all times a smooth one for al-Zawahiri’s EIJ. Some researchers have suggested that al-Zawahiri’s allegiance with Al-Qaeda caused another split within the EIJ between those supporting the move, and those who felt al-Zawahiri had become distracted from the original goal of overthrowing the Egyptian government.

In terms of perpetrated attacks, the EIJ is believed to be responsible for assassinating Egyptian President Anwar Sadat in 1981, as well as attempting to assassinate Interior Minister Hassan al-Alfi in 1993 and Prime Minister Atef Sedky in the same year.

Since his assimilation into Al-Qaeda in 1998 Al-Zawahiri went on to become in 2009 the organisation’s operational and strategic commander. After bin Laden’s death on 2 May 2011 Al-Zawahiri became Al-Qaeda’s official leader.

Gama'a al-Islamiya (IG) - Egypt

Gama'a al-Islamiyya, Egypt's largest militant group, has been active since the late 1970s, originally formed by the coming together of militant student cells following the renunciation of violence by the Muslim Brotherhood.

As is the case with many terrorist groups, Gama'a al-Islamiyya recruited many of its leaders from amongst the ranks of dissatisfied and radical students, and from the radical Islamist group Takfir wal-Hijra which was crushed by the Egyptian military in the 1960s, while the bulk of the membership originate from economically deprived regions, predominantly in the south of Egypt.

The emergence of radical Islamic terrorist groups in Egypt was widely linked to the renaissance of political Islam that has swept through much of the Arab world since late-1960s. Gama'a al-Islamiyya's individual brand of Islam is dictated by the spiritual leadership of Shaykh Umar Abd al-Rahman, a figure who diverged from the Muslim Brotherhood. Al-Rahman, despite spending many years behind bars, has also supplied a great deal of the group's strategic decision making.

Originally the self-proclaimed objective of Gama'a al-Islamiyya was to overthrow the Egyptian government, replacing it with an Islamic state. However its members have also been involved in religious crusades beyond Egypt, many taking part in the Afghan Jihad during the Soviet occupation of Afghanistan and the civil war that followed their withdrawal. Nonetheless the external wing, composed mainly of exiled members scattered across several countries, maintained its primary goal

to overthrow the Egyptian government of President Mubarak.

Since its formation the Gama'a al-Islamiyya has experienced fissures within its organisation, the first of which took place in 1997 following an attack on Western tourists at Luxor. The attack, planned to demonstrate the Egyptian government's powerlessness to protect foreigners, proved to be a political miscarriage and resulted in a backlash of public outrage towards the perpetrators rather than the government. Consequently a cease-fire was called by the group's then leadership, from which two factions emerged.

The first faction, led by Mustafa Hamza, supported the cease-fire, while the second, led by Refai Ahmed Taha, called for an immediate return to armed operations. Later Taha caused further fractures to emerge within Gama'a al-Islamiyya when he signed Osama bin Laden's declaration of war against ‘Jews and Crusaders’. The decision to join Al-Qaeda was not accepted by a large portion of Gama'a al-Islamiyya and has resulted in what might be described as the formation of radical and non-radical wings.

Following this split Taha's radical faction based in Afghanistan continued to have close associations with Al-Qaeda and the Egyptian Islamic Jihad (EIJ). Following the 9/11 attacks Taha's faction was targeted by US-led forces in Afghanistan and what remained of the faction is believed to have dispersed into Pakistan and various outlying regions, but may have regrouped.

In March 2002, members of the group's historic leadership remaining in Egypt declared the use of violence misguided and renounced acts of terrorism in the future. While this declaration was not accepted by leadership figures of the organisation's radical wing in foreign exile (some of whom have since announced their union with Al-Qaeda), such a move no doubt contributed to the Egyptian government's release of some 900 members in 2003, as well as up to 700 more in 2004.

At the height of its operational activity Gama'a al-Islamiyya conducted armed attacks against Egyptian security and other government officials, Coptic Christians, and Egyptian opponents of Islamic extremism.

The most notable attacks in Gama'a al-Islamiyya's history are those which targeted foreign tourists at Luxor in 1997, and the 1995 attempted assassination of the Egyptian President Hosni Mubarak in Ethiopia. Today the group is believed to have support in Cairo, Alexandria, and other urban centres within Egypt, as well as in foreign territories such as Afghanistan, Yemen, the UK and elsewhere in Europe.

In 2011 the group also established a political party known as the Building and Development Party, contesting the 2011–2012 elections as part of the Islamic Alliance and winning a total of 13 seats.

Turkey

Turkey is located at the crossroads of Europe and Asia and has been of strategic importance since even before the time of Alexander the Great who Hellenised the area which continued with the Roman rule and the transition into the Byzantine Empire, followed by the Turkification

of the region leading to the creation of the Ottoman Empire encompassing much of Southeastern Europe, Western Asia and North Africa. After the Ottoman Empire collapsed following its defeat in World War I, parts of it were occupied by the victorious Allies. The Turkish War of Independence, initiated by Mustafa Kemal Atatürk and his colleagues, resulted in the establishment of the modern Republic of Turkey in 1923, with Atatürk as its first President. Turkey is a democratic, secular, unitary, constitutional republic with a diverse cultural heritage. The country's official language is Turkish, a Turkic language, which is spoken by approximately 85% of the population. Turks constitute 70% to 75% of the population. The vast majority of the population is Muslim. The largest minority making up 18% are the Kurds, many of whom want to see a separate Kurdistan and support the PKK and other groups seeking secession and autonomy. Turkey's location between Asia and Europe, make it one of the most significant transit locations for drugs and human trafficking.

Turkey Designated Terrorist Organisations

In addition to the PKK, Turkey has designated¹⁴ the following active groups as terrorist organisations: Communist Workers Party of Turkey (TKP); Revolutionary People's Liberation Party-Front; Maoist Communist Party; Communist Party of Turkey/Marxist-Leninist; Marxist Leninist Communist Party; Revolutionary Communist Party of Turkey; Revolutionary Party of Kurdistan; Democratic Party of Kurdistan/North); Kurdish-Hezbollah also known as Kaplanclar; Great Eastern Islamic Raiders' Front and Hizb ut Tahrir. The Kurdistan Freedom Falcons (TAK) is not on the list despite being designated as a terrorist organisation by the US, EU and the UK because Turkey views the group as part of the PKK.

Kurdistan Workers Party (KADEK/KONGRA-GEL) - Turkey/Iraq

The Kurdistan Workers' Party (PKK) was founded in 1974 by Turkish left-leaning students of Kurdish descent.¹⁵ Ascribing to Maoist ideology the organisation sought to act as the vanguard of a revolutionary movement to secure an independent Kurdish state.

On its foundation the group asserted that a Kurdish state could only be created following the overthrow of the Turkish government, which it saw as an oppressive colonial power. The PKK held dual objectives, intending to both unite [the divided revolutionary left in Turkey] and secure an independent Kurdish state. In its early years the student led PKK established training camps in an area of Syrian-controlled Lebanon known as the Bekaa valley, and later in 1984 set up similar training camps in France, from where it launched a number of operations in European countries. Full-scale PKK insurgency within Turkey began in the early 1990s and the group successfully seized control of large swathes of countryside in the south-east. This campaign endured until 1999 when a cease-fire was called, an agreement that was to be officially retracted in 2004. In terms of organisational strength, the PKK was estimated in 1994 to have 10,000 to 15,000 members. The group's most notable income sources are believed to be derived from drug smuggling and extortion. Some revenue is also channelled through charities, while Iran, Iraq and Syria have also provided financial aid. High risk targets of PKK attacks have been Turkish government facilities and personnel, as well as any groups, including Kurds, thought to be collaborating with the regime. The scale of violence perpetrated by the PKK has led some to believe that more than 30,000 civilians perished as a direct result of their operations. Since 2002 the group has undergone numerous cosmetic name changes and has on several occasions proclaimed a commitment to non-violence while simultaneously continuing violent operations against the Turkish authorities. As a result fighting between Turkish and PKK forces has continued throughout the early 2000s, with Turkish forces frequently striking the Kurdistan region of Iraq, from which the PKK has launched many of its operations.

Today the PKK no longer campaigns for complete separation from the Turkish state, but rather champions a move towards a more democratic and confederalised Turkey. However in September 2012 fighting between PKK and Turkish forces reportedly escalated to new highs, demonstrating that the group remains a highly potent force with significant military capabilities. Recent peace negotiations between the PKK and the Turkish government were announced in 2013 with the PKK agreeing to a ceasefire and agreeing to move PKK fighters out of Turkey into mountain strongholds in Northern Iraq. It is thought the PKK may be willing to settle for greater autonomy, including constitutional and linguistic rights and to drop demands for an independent Kurdish state. A splinter group, the Kurdistan Freedom Falcons designated by the US in 2008 continues its violent struggle for Kurdish independence.

The PKK has used other names in order to suggest it has changed namely, the Kurdistan Freedom and Democracy Congress (KADEK) and the Kurdistan People's Congress (KONGRA-GEL)

Kurdistan Freedom Falcons

The Kurdistan Freedom Falcons (TAK), also known as the Kurdistan Freedom Hawks or the Kurdish Vengeance Brigade, is a militant group that has committed attacks throughout Turkey, operating in southern Turkey and northern Iraq with a goal of securing Kurdish secession from Turkey. It is unclear whether or not TAK is connected to any other Kurdish nationalist organisations, though it is believed they split off from the Kurdistan Workers Party (PKK) when they became dissatisfied with the group's tactics. Some Turkish security analysts have alleged that Bahoz Erdal may be the leader of the TAK. Most TAK attacks are directed against tourist areas in Istanbul, Ankara, and southern coastal resort areas. In the first three months of 2006, they claimed responsibility for eight bombings that killed two and injured 47 civilians. TAK has been designated as a terrorist organisation by the US, UK and by the EU.

Revolutionary People's Liberation Party (DHAKP)-Front - Turkey

The DHKP/C is a marxist, anti-western terrorist group that fought against previous Turkish regimes, considering them fascist and imperialist forces of the West, particularly the US and NATO and in particular the group has been intensely outspoken against US military operations in Afghanistan and Iraq. The group was designated as a US terrorist organisation in 2005.

Turkish Mafia - Turkey

Highly secretive and ruthless, the Turkish Mafia in some respects, mirror the Sicilian Mafia of years past, with its highly intricate code of honor based upon a patriarchal system of respect tracing its origins to the days prior to the Ottoman arrival. Encoded into an order, it became known as the Canun of Lek Dukagjeni. This code was religiously followed in the north of the country, where a clan system predominated life. Every aspect of social relations is embodied in the Canun. Based upon respect, family and loyalty, the code has been used by the criminal groups as a means to ensure allegiance. The extended family is given high priority and an attack upon one of its members constitutes a hukmarr_je, or blood feud, an attack upon the entire family or organisation. The ethnic requirement, though, is the highest priority. Similar to La Cosa Nostra, members entry obligates possible recruits to swear an oath of allegiance and secrecy, an omerta, or besa. The Turkish Mafia activities include drugs and refugee smuggling, arms trafficking, contract killing, kidnapping, false visa forgery, and burglary. Whilst Turkish criminal gangs had long existed they were a scattered and disorganised band of gangs, largely working for others. This changed though through a number of important developments which transformed them from local criminal gangs into international major operators to rival those in Russia, Italy and elsewhere. Firstly the campaign against the Italian Mafia by for example US Law Enforcement provided an opportunity for others, including the Turks to take up part of the drug trade previously controlled by the Ital-

ians. Secondly, the civil war in Yugoslavia which helped divert approximately 60% of Western Europe's heroin trade. From Central Asia and through the Middle East, the drug trade had long used Yugoslavia as a conduit for the rest of Europe for years. Realizing that they now required an alternate route, an organised Turkish Mafia quickly offered their services and together with the Albanian Mafia linked up to provide overland routes for drugs to travel from Turkey to Greece and then to Macedonia. From there on the coast in small craft, capable of avoiding detection travel either north towards the Dalmatian coast or across to Italy. The drugs that land in Italy do so with the assistance and blessing of the Sacra Corona Unita of Puglia, Italy taking a percentage of the profits. This type of trade and activity has increased and estimates suggest that the Turkish Mafia now control 70% of all illegal heroin trade bound for Austria, Germany and Switzerland. A great source of recruitment and local knowledge and support comes from the émigré communities located throughout Western Europe. Whether in UK, Italy, Austria, Germany, or Switzerland, either trafficked by the gangs already or ethnics legally resident from Turkey, have been sought out by organised crime groups for criminal activity. Many find it hard to assimilate and to find decent employment and are taken on as cheap labour in Turkish restaurants, cafes, and the like. For some the lure of working with the Mafia is hard to resist. While authorities are not certain as to who may control large sections of organised Turkish gangs, some information is known about the groups. One 'godfather' of the Turkish mafia is reputed to be a drug trafficker called Dau Kadriovski. Based in Turkey, Kadriovski reportedly has extensive links throughout Europe. Authorities also believe that Kadriovski may have links with the Ulkuculer or Grey Wolves. Despite efforts by law enforcement to curb his activities, Kadriovski continues to evade police. The most well known Turkish organised criminal gang however is the Ulkuculer or Grey Wolves.

Ulkuculer/Grey Wolves - Turkey

The Ulkuculer's formal name in Turkish is Ulkucu Hareket (The Idealist Movement). Members of the Ulkuculer are of Kurdish stock are designated as Cyngyraky Yylan, a variation of the Turkish word for rattlesnake. The Ulkuculer participate in a diverse range of criminal enterprises from human trafficking and prostitution to narcotics and gambling. They are close to and work with the Albanian Mafia, particularly the Bano Aldo Bare. Whilst secretive, the Ulkuculer is reportedly led by Abuzer Ugurlu who first emerged as a smuggler of arms, before moving on to more lucrative drug smuggling. The organisation was suspected by some of involvement in the murder of Pope John Paul II by the Turkish criminal Mehmet Ali Agca, the gang being already paid US\$1.7mio to kill the pope. Whilst the motives for the attempted assassination remain unclear, the leading claims had Russian and Bulgarian brokers as most likely involved, and not the Turkish Mafia though on-one has ultimately been held to account beyond Agca.

Asia

Asia, covering over 30% of the world's land area is also the most populous with 4.3 billion people (60% of the world's population). With diverse ethnic groups, cultures and environments, Asia is one of the most heterogeneous. Today its 46 countries contain very diverse economic and

political systems and historical ties many influenced by the European imperial era.

The name Asia dates back to classical antiquity with several theories but its provenance is ultimately unknown. Its perceived boundaries have changed over time and even today many different bodies have differing definitions. As well as having several geographical definitions for Asia as a whole its sub-regions can also cause confusion. For example all of Russia is deemed to be within Eastern Europe even though most of it is in Asia. The other sub-regions (as defined by the UN) include Central Asia, Western Asia, Southern, Asia Eastern Asia and South Eastern Asia. These classifications are very much historical/political constructs rather than obvious topographical boundaries such as the seas and oceans which bound Africa. To add to the confusion most European languages use the word 'Asian' to mean ethnic origin and which are often based on their own historical experiences. American English speakers take the word to mean someone from East Asia whilst British English speakers would regard an 'Asian' as someone from South Asia. For many centuries India and China were both at different times the largest economies in the world and European colonialism were mainly motivated by the desire to access these economies. The discovery of America came as a result of Western European countries wanting to get to India and the 'East' by a different route. Most of Asia up until the Second World War was in fact ruled by colonial powers and although China and Japan never were colonised they were in different ways profoundly affected by western imperialism.

Today Asia is the fastest growing economic area of the world with China as the second largest economy in the world. Indonesia is the 15th largest with South Korea 12th largest, Japan 4th largest and India 3rd largest. There are however wide disparities of wealth and income within and between some of the countries of Asia. What is clear is that in an era of globalisation the economic fortunes of the developed world are inextricably tied up with those of Asia and in particular China.

Southern Asia

South or Southern Asia is principally what is sometimes referred to as the Indian Sub-Continent i.e. Afghanistan, India, Pakistan, Bangladesh, Nepal, Bhutan Sri Lanka and the Maldives. The wider UN extended classification is used that includes Burma Iran and the China-Tibet Autonomous Region. The region has a population of approximately 1.8 billion which constitutes about 20% of the world's population. It is the most populous and most densely populated region in the world.

There is current and on-going violent conflict in Afghanistan, Pakistan, and the Indian Provinces of Jammu and Kashmir. In 2006 it was said that 232 of India's 640 districts suffered some degree of terrorism from insurgent and terrorist movements. In 2008 MK Narayanan the then Indian National Security Adviser said that but there were over 800 terrorist cells in India. The Government of India's Ministry of Home Affairs has listed 36 terrorist organisations. Pakistan also is regularly a victim of its own internal terrorist groups. Sri Lanka has emerged from a civil war and insurrection from Tamils and has been accused of acts of State Terrorism that include the massacre of civilians by several governmental and military organisations.

Sri Lanka has the highest GDP Per capita in South Asia with Afghanistan at the lowest. India is the economic giant of the region accounting for over 80% of the regional economy and is the world's 10th largest in nominal terms. Pakistan has the 5th largest GDP in the region

India is a member of the BRIC economies which are said to be at a similar stage of recent advanced economic development. However when taking income and wealth distribution into account many economists point out that South Asia is the poorest region in the world behind Sub Saharan Africa. According to the UN Multidimensional Poverty Index more than 25% of the world's poor, as defined by the index, live in Africa whilst 50% live in South Asia. The study showed that there were more poor people in eight Indian States than in the 26 poorest countries. World Bank poverty data in 2005 suggested that 40% of South Asia's population lived on less than the then International Poverty Line figure of US\$1.25 a day with the comparable figure in Sub-Saharan Africa of 50%.

Afghanistan

Ahmad Shah Durrani unified the Pashtun tribes and founded Afghanistan in 1747. The country served as a buffer between the British and Russian Empires until it won independence from nominal British control in 1919. A brief experiment in democracy ended in a 1973 coup and a 1978 communist counter-coup.

The Soviet Union invaded in 1979 to support a weak Afghan communist regime and withdrew 10 years later following strong opposition from an internationally supported anti-communist Mujahideen rebel force. A series of subsequent civil wars saw Kabul finally fall in 1996 to the Taliban, who had emerged in 1994 to end the country's civil war and anarchy. Following the 11 September 2001 terrorist attacks, US, Allied, and anti-Taliban Northern Alliance military action toppled the Taliban for sheltering Osama bin Laden and Al-Qaeda. Elections in December 2004 brought Hamid Karzai to the Presidency and he has since been re-elected in 2009. Despite gains toward building a stable central government, a resurgent Taliban and continuing provincial instability, particularly in the south and the east - remain serious challenges for the Afghan Government.

There is widespread corruption in Afghanistan and political instability impedes counterdrug efforts. Corruption remains a serious problem in Afghanistan with according to Transparency International, Afghanistan ranking equal 176 out of 176 countries in its 2012 Corruptions Perceptions Index, alongside North Korea and Somalia.

The presidential election for Afghanistan will take place in 2014, with current President Karzai not permitted to run for a third term. Corruption and ballot rigging last time in 2009 is also feared this time around. Candidates and frontrunners for the top positions include former main opposition leader Dr Abdullah Abdullah, who came second last time and a former foreign minister, Zalmay Rassoul, a close associate of Hamid Karzai and Ashraf Ghani, a former World Bank economist and former Finance Minister.

Crime in Afghanistan is present in various forms, and includes: corruption, contract killings or assassinations, kidnapping, drug trafficking, money laundering, and black marketeering. Since the downfall of the Taliban, crime rate has significantly increased in the capital city Kabul. Unemployment among a large portion of the population and rudimentary basic services are major factors behind crime and lawlessness. Armed robberies, burglaries, assault and kidnapping are regularly reported, particularly in the capital of Kabul. According to a 2013 Transparency International report, Afghanistan comes equal last in its Corruption Perception Index.

Despite government attention to eradicate poppy cultivation and after ten years of occupation by US led coalition forces not only is Afghanistan the largest

producer of opium in the world but according to the 2013 Afghanistan Opium Survey released in November 2013 Afghan Ministry of Counter Narcotics and the UNODC, opium poppy cultivation in Afghanistan rose 36% in 2013 to a record high.

Opium production amounted to 5,500 tons, up by almost a half since 2012. The area under cultivation rose to 209,000 hectares from the previous year's total of 154,000 ha, higher than the peak of 193,000 hectares reached in 2007. Almost 90% of opium poppy cultivation in 2013 remained confined to nine provinces in the southern and western regions, which include the most insurgency-ridden provinces in the country. Helmand, Afghanistan's principal poppy-producer since 2004 and responsible for nearly half of all cultivation, expanded the area under cultivation by 34%, followed by Kandahar, which saw a 16% rise.

Although lower than in 2012, opium prices continued to lure farmers at around US\$145 per kg, much higher than the prices fetched during the high yield years of 2006-2008. Worth around US\$950mio, or 4% of national GDP in 2013, the farm-gate value of opium production increased by almost a third. Together with profits made by drug traffickers, the total value of the opium economy within Afghanistan was significantly higher, implying that the illicit economy will continue to grow whereas a slowdown of the legal economy is predicted in 2014.

The UNODC called for an integrated, comprehensive response to the drug problem, with counter-narcotics efforts forming an integral part of the security, development and institution-building agenda. These record figures come ahead of the 2014 withdrawal of international forces from the country.

The Taliban and other antigovernment groups participate in and profit from the opiate trade, which is a key source of revenue for the Taliban inside Afghanistan. The growth in Afghanistan's banking sector has slowed considerably in recent years; and traditional payment systems, particularly hawala networks, remain significant in their reach and scale. The corrupt government and weaknesses in the banking sector incentivize the use of informal mechanisms and exacerbate the difficulty of developing a transparent formal financial sector in Afghanistan. The unlicensed and unregulated hawaladars in major drug areas such as Helmand likely account for a substantial portion of the illicit proceeds being moved in the financial system. Afghan business consortiums that control both hawaladars and banks allow criminal elements within these consortiums to manipulate domestic and international financial networks to send, receive, and launder illicitly-derived monies or funds intended for criminal, insurgent, or terrorist activities. Afghanistan is a source transit, and destination country for men, women, and children subjected to forced labour and sex trafficking, although domestic trafficking is more prevalent than transnational trafficking.

Special Focus 8 Al-Qaeda - Afghanistan/Pakistan

Al-Qaeda (AQ) is a broad-based militant Islamist organisation founded by Osama bin Laden in the late 1980s. The organisation began as a logistical network to support Muslims fighting against the Soviet Union during the Afghan War; members were recruited throughout the Islamic

world in a trans-national religious war-effort commonly known as the Afghan jihad. The philosophy underpinning the group is one of "defensive jihad", a concept under which Muslims are encouraged to take it upon themselves to fight perceived attacks on the Muslim faith across the world. As an extension of this view, the group aims to overthrow 'un-Islamic regimes' that they believe oppress their Muslim citizens and replace them with genuine Islamic governments. It is also their intention to expel US soldiers and Western influences from the holy territories of the Gulf and Iraq, as well as capture Jerusalem as a Muslim city. Further reported beliefs include the conviction that a Christian-Jewish alliance is conspiring to destroy Islam and that the killing of bystanders and civilians is religiously justified in jihad.

When the Soviets withdrew from Afghanistan in 1989, the organisation dispersed but continued to oppose what its leaders considered corrupt Islamic regimes and foreign (i.e., US) presence in Islamic lands. Based in Sudan for a period in the early 1990s, the group eventually re-established its headquarters in Afghanistan (c. 1996) under the patronage of the Taliban militia.

AQ merged with a number of other militant Islamist organisations, including Egypt's Islamic Jihad (EIJ) and the Islamic Group (IG), and on several occasions its leaders declared jihad (holy war) against the US. The organisation established camps for Muslim militants from throughout the world, training tens of thousands in paramilitary skills, and its agents engaged in numerous terrorist attacks, including the destruction of the US Embassies in East Africa and by AQAP a suicide bomb attack against the US Warship Cole in Aden, Yemen. AQ also aligns itself with and actively supports numerous terrorist groups throughout the world that are recognised as furthering their own goals. These include groups fighting Muslim governments with allegedly apostate rulers (Egypt under former President Mubarak, Algeria, post-2002 Afghanistan and Saudi Arabia),

groups fighting regimes perceived to oppress their Muslim citizens (Kosovo, India, Russia and Indonesia), and groups fighting to establish their own Islamic state (Palestine, Chechnya, Dagestan and Mindanao). AQ supports these groups in two ways; both by training group members in its camps and by sending its own members to help these groups in their local struggles. Training for its own members and for members of allied groups has focused on insurgent warfare in addition to the classic "terrorist" techniques that are usually associated with the group. Some experts even believe that the ratio of insurgent fighters to terrorists in Al-Qaeda camps may have been 15 to 1. American military officials have described the majority of those training in Al-Qaeda camps as "irregular ground combatants." Fighters such as these engaged US troops at Shai-e-Kowt and Tora Bora in Afghanistan.

In 2001, 19 militants associated with Al-Qaeda staged the September 11 attacks against the US. Within weeks the American government responded by attacking Taliban and Al-Qaeda forces in Afghanistan. Thousands of militants were killed or captured, among them several key members (including the militant who allegedly planned and organised the September 11 attacks), and the remainder and their leaders were driven into hiding.

The invasion of Afghanistan in 2001 challenged that country's viability as an Al-Qaeda sanctuary, compromising communication, operational, and financial linkages between the Al-Qaeda leadership and its vast network of militants. Rather than significantly weakening Al-Qaeda, however, these realities prompted a structural evolution and the growth of "franchising." Increasingly, attacks were orchestrated not only from above by the centralized leadership (after the US invasion of Afghanistan, based in the Afghan-Pakistani border regions) but also by the localized, relatively autonomous cells it encouraged. Such independent grassroots groups coalesced locally around a common agenda but subscribing to the Al-Qaeda name and broader ideology thus meant a diffuse form of militancy, and one far more difficult to confront. Sleeper cells embedded in several countries with indoctrinated members leading ordinary lives and activated at the behest of the terrorist commanders add further complexity to the problem of identification.

With this organisational shift, Al-Qaeda was linked whether directly or indirectly to more attacks in the six years following September 11 than it had been in the six years prior, including attacks in Jordan, Kenya, Saudi Arabia, Indonesia, Turkey, the UK, Israel, Algeria, and elsewhere. At the same time, Al-Qaeda increasingly utilised the Internet as an expansive platform for communication and recruitment and as a mouthpiece for video messages, broadcasts, and propaganda. Meanwhile, some observers expressed concern that US strategy centred primarily on attempts to overwhelm Al-Qaeda militarily was ineffectual, and at the end of the first decade of the 21st century, Al-Qaeda was thought to have reached its greatest strength since the attacks

of September 2001. On 2 May 2011, bin Laden was killed by US military forces after US intelligence located him residing in a secure compound in the cantonment town of Abbottabad, Pakistan, approx 110kms from the capital of Pakistan, Islamabad. The operation was carried out by a small team that reached the compound in Abbottabad by helicopter. After bin Laden's death was confirmed, it was announced by US President Barack Obama, who hailed the operation as a major success in the fight against Al-Qaeda. On 16 June 2011, Al-Qaeda released a statement announcing that Ayman al-Zawahiri, bin Laden's long-serving deputy, had been appointed to replace bin Laden as the organisation's leader.

In terms of financial structure AQ is not only a combatant organisation, it's also and most of all a confederation of militant organisations around the world and money is used to support and enhance this confederation. Money is therefore needed to fund, stabilise and leverage their support and to develop their reach. Over the years AQ has financially supported numerous entities, from Libya to the Philippines, from Indonesia to Somalia. Figures here range in millions of dollars. Money is also needed to pay for protection and asylum. Since 1991, AQ had to resettle in various countries after the opposition movement was banned from Saudi Arabia. It has been the same story in Sudan, Afghanistan, and now most likely in the tribal areas of Pakistan. Such expenditures will include Communication, Networks, Training facilities, Protection etc were estimated to utilise 90% of AQ operational funds. The remaining 10% being used to fund the planning and execution of terrorist attacks. Within a 10-year period, the financial support at the disposal of AQ or its sister organisations, received through direct donations or Zakat funds to charities or through various fraudulent schemes ranged from between US\$300mio and US\$500mio in total, a sum that is then commingled and often diverted or siphoned to groups that support terrorism. AQ's expenditures have decreased significantly since the 9/11 attacks, although it is impossible to determine to what extent. The organisation has also become decentralized and it is unlikely that a formal finance structure exists.

AQ no longer pays money to the Taliban (for safe haven or otherwise) and no longer operates extensive training camps in Afghanistan or elsewhere. It does still however provide operatives and their families with modest support and occasionally provides funds to other terrorist organisations, especially those in Southeast Asia. Intelligence analysts estimate that Al-Qaeda's operating budget may be only a few million dollars per year, although such estimates are only tentative.

Charities and the Islamic phenomenon of Zakat are the most important source of financial support for the AQ network, essentially because it is the most usual and unregulated way to raise donations, particularly in the Middle East though this has changed and been the subject of increased regulation and oversight. In several cases, money originating from Islamic banks and chari-

ties in the Gulf was moved through Western correspondents, whether banks or charities, before reaching their recipients. In that respect, much of the financial revenue of AQ was raised through legal means. Charitable giving, known as Zakat, is one of the five pillars of Islamic faith and represents a much broader notion of charity than that to which we in the West are accustomed. In many ways comparable to the Christian tithe, the Zakat also functions as a form of income tax, educational assistance, foreign aid, and expression of political support. The Western notion of the separation of civic and religious duty generally does not exist in Islamic cultures with religion also guiding temporal aspects of life. For instance the Saudi government has declared that the Koran and the Sunna tradition of Muhammad are to function as the country's constitution, and the clergy within Saudi Arabia wield enormous influence over the cultural and social life of the country. AQ's reliance on charities to raise, mask, transfer and distribute the funds it needs, has been put under close scrutiny by counter-intelligence and enforcement agencies around the world. These included more than 50 international and local charities, many of these charities were based or funded from the Gulf Region and/or from Afghanistan and/or Pakistan. These included the International Islamic Relief Organisation (IIRO) (Philippine and Indonesian branches), the Benevolence International Foundation, the Al Haramain Islamic Foundation (Bosnian and Serbian Offices), Blessed Relief (Muwafaq) Foundation, the Al-Akhtar Trust, the Afghan Support Committee, the Al-Rashid Trust, the Revival of Islamic Heritage, the Global Relief Foundation, Taibah Int, Al-Furqan, Sanabah Charitable Committee and the Rabita Trust (see Part 2, Section 7, Criminal Cases for more details).

Donors

Following the invasion of Afghanistan by Soviet forces and the establishment of the Arab Mujahideen in Afghanistan in 1980, wealthy AQ gulf businessmen, bankers and institutions forged the financial backbone of AQ by transferring or facilitating the transfer of funds to charities or fronts tied to the Mujahideen struggle. A number of these donors have been identified in post 9/11 US litigation as being sponsors of AQ, however all vehemently deny such accusations and it has to be said no findings against such persons by a US or other court have been made. Nevertheless it is believed that AQ can still draw on hardcore donors who knowingly fund it and sympathizers who divert charitable donations to it. The exact extent to which the donors know where their money is going remains unclear. Still, there are suspicions that some Gulf donors did know that the fundraisers really were connected to AQ. Donors, whilst still at the core of AQ's revenue stream, remain under extreme pressure. There is little debate that the killing and capture of numerous important AQ members has decreased the amount of money Al-Qaeda is able to raise and has made it more expensive and difficult to raise money. The May 2003 terrorist attacks in Riyadh, moreover, seem to have reduced AQ's available funds even more –some say drastically - for a number of rea-

sons; i) it appears that enhanced scrutiny of donors by government bodies, especially that of Saudi Arabia, has made the act of donation a great deal more arduous for would-be supporters. ii) Saudi law enforcement efforts have captured or killed AQ facilitators in the country and iii) the Saudi population following these attacks are less inclined to fund AQ generally.

Bin Laden's Fortune

According to the 9/11 Commission Report and contrary to popular myth, bin Laden did not support AQ through a personal fortune or a network of businesses. For many years, the reverse was thought true, that bin Laden did indeed have access to and bankrolled AQ through a vast personal inheritance or through the proceeds of the sale of his Sudanese businesses. bin Laden was alleged to have inherited approximately US\$300mio when his father died, funds used while in Sudan and Afghanistan. Following US and Saudi Intelligence Sharing and interviews with the bin Laden family members the myth of bin Laden's fortune was discredited. From about 1970 until 1993 or 1994, bin Laden received about US\$1mio p.a - adding up to a significant sum, to be sure, but not a US\$300mio fortune. In 1994 the Saudi government forced the bin Laden family to find a buyer for bin Laden's share of the family company and to place the proceeds into a frozen account. The Saudi freeze had the effect of divesting bin Laden of what would otherwise have been a US\$300mio fortune.

State Sponsorship

States sponsors may contribute to terrorist groups such as Hamas and Hezbollah but there is no credible evidence of state sponsorship of AQ.

Companies and Businesses

While there is little hard evidence, considerable anecdotal information exists suggesting that Al-Qaeda and its sympathizers ran businesses to support the terrorist network. Shortly after September 11, US investigators looked at several businesses in Yemen that were implicated in funding AQ. They named the Al Hamati Sweet Bakeries and two honey businesses, Al Nur Honey Press Shops and Al Shifa Honey Press for Industry and Commerce. The Treasury Department charged that these companies knowingly funnelled money to bin Laden as well as assisting in the transportation of arms for Al-Qaeda. Both these operations were still in business long after 9/11. It is suggested that when OBL relocated to Sudan in 1991, he used his close relations with the then extensive power of Islamic leader Hasan al-Turabi to set up several business ventures, and built relationships with Sudanese leaders of the National Islamic Front (NIF).

In concert with NIF members, bin Laden is alleged to have invested in several large companies and banks, and undertook civil infrastructure development projects. The network of businesses controlled by bin Laden allegedly included a bank, an import-export firm, several agricultural companies, and a construction company to build roads and airport facilities in Sudan. These businesses enabled him to offer asylum and employment to AQ

members, as well as providing bank accounts for several operatives. This revenue stream also allowed bin Laden to finance terrorist operations and facilities, investing predominantly in training camps and weapons.

During the early 1990s, Al-Qaeda ran a series of international businesses out of its safe haven in Sudan. Nevertheless, according to the 9/11 Commission Report bin Laden's assets in Sudan were not a source of revenue for AQ. bin Laden was reputed to own 35 companies in Sudan when he lived there from 1992 to 1996, but some may never have actually been owned by him and others were small or not economically viable. His investments were most likely designed to gain influence with the Sudanese government rather than serve as feasible income sources. When bin Laden was pressured to leave Sudan in 1996, the Sudanese government apparently expropriated his assets and seized his accounts, so that he left Sudan with practically nothing. Consequently when he moved to Afghanistan in 1996, his financial situation was dire; it took months for him to get back on his feet. While relying on the good graces of the Taliban, bin Laden reinvigorated his fund-raising efforts and drew on the ties to wealthy Saudi nationals that he had developed during his days fighting the Soviets in Afghanistan. Financial support was also gained from elsewhere in the world. In a report submitted to the UN Al-Qaeda and Taliban Sanctions Committee the Government of the Philippines indicated that Mohammed Jamal Khalifa, bin Laden's brother-in-law, had established within its borders, numerous businesses, corporations and charitable institutions there which had served as a network to fund the Abu Sayyaf Group as well as other extremist organisations. These reportedly included the Khalifa Trading Industries, ET Dizon Travel Pyramid Trading, Manpower Services and Daw al-Iman al-Shafee Inc. AQ operative, Wali Khan Amin Shah, established several shell companies in Malaysia, as did Hambali, who used a shell "import export" company called Konsojaya Trading Company as a front to conceal terrorism funding transactions.

Drug Trafficking

According to the 9/11 Commission Report, after reviewing the relevant intelligence on AQ's involvement in drug trafficking and interviewing the leading authorities on the subject, there has been no substantial evidence that AQ played a major role in the drug trade or relied on it as an important source of revenue either before or after 9/11. While the drug trade was an important source of income for the Taliban before 9/11, it did not serve the same purpose for AQ. Unlike AQ the Taliban were known to take a large cut from this US\$6bio drug trade. However, following the crackdown on charities, some experts believe that AQ may have come to rely more heavily on drug money.

Conflict Diamonds

Allegations that AQ has used the trade in conflict diamonds to fund itself remain similarly unsubstantiated. 9/11 Commission staff have evaluated the sources

of information for these various public reports alleging illicit trade in diamonds.. These include the reports of journalists, the UN, and certain non-governmental organisations investigating this issue. The FBI conducted an intensive international investigation into the conflict diamond claims, including interviews of key witnesses with direct knowledge of the relevant facts, and found no evidence of any substantial AQ involvement. The CIA came to the same judgment.

Kidnapping

In one of its training manuals, AQ refers to the "carrying out [of] threats (extortion) against other regimes if they do not give willingly". In this case "one or two assassinations should be carried out so that the regime would realize that we are serious about our threats". The same applies to international companies such as "pharmaceutical companies, airline companies, insurance companies and petroleum companies, big industrial companies and meat companies, fruit companies". Certainly in Iraq, since the beginning of the Iraq war, according to US government figures hundreds of foreigners from more than 10 different countries have been taken hostage. These numbers are small in comparison to the kidnappings of Iraqis, which at one time took place at the rate of 10-30 per day, mainly for purposes of ransom. Many of these kidnappings were carried out by common criminals and some by AQ. The average ransom paid by Iraqi families was thought to be approximately US\$30,000, with the amount rising to US\$100,000 for foreigners but increasing substantially higher for Western hostages. The Italian press reported that its government paid millions of dollars in ransom to free two aid workers and, later, journalist Giuliana Sgrena. Some criminals were believed to have sold their foreign captives to AQ or other extremist groups, which are believed to pay high bounties for Westerners, especially Americans. On 8 March 2006 the website of Al-Arabiya satellite news channel published an interview with Abu Hafs, described as an aide of Abu Musab al-Zarqawi, a Jordanian militant infamous for publicised beheadings of American citizens, explaining his group's treatment of hostages: "We are in a war zone, and we have four ways to deal with hostages: killing the hostages and beheading them when we can't find a religious reason to preserve their lives, which is decided by religious courts that we founded. Sometimes we resort to the second option, which is trading hostages for our own prisoners; there's a third option that we don't like but is followed out of necessity, which is demanding a ransom; the fourth is release of AQ prisoners if the court finds them innocent."

Fraud Schemes including Smuggling and Credit Card Fraud

It is believed that fraud schemes have been used by AQ cells particularly in Europe. An AQ cell in Spain allegedly used stolen credit card numbers and provided forged credit cards for the use of AQ cells in other countries. Similar activity was also reported in Belgium. That being said it should be noted that in the 9/11 case

the hijackers were less than knowledgeable in the use of the US financial system. For example, the teller who opened an account for Atta and al-Shehhi, two of the plot leaders, spent an hour with them, explaining the procedures for ATM transactions and wire transfers, and one branch refused to cash a cheque for al Shehhi on one occasion because he presented IDs with different addresses. This incident led the bank to issue a routine internal security alert to watch the account for possible fraud, but provided no basis for concern about serious criminality let alone terrorism .

Maritime Piracy

According to the International Maritime Bureau, both the frequency and the violence of piracy acts have increased in recent years. The traditional operating areas of maritime pirates are the Arabian Sea, the South Chinese Sea, the waters off the coast of West Africa and the Straits of Malacca. Links between these pirates and terrorists, whilst circumstantial, have been made by NATO.

Precious Commodities

Beyond the raising of finances, it is also crucial for AQ to safely and covertly deposit its assets. The crackdown on AQ financing may have led AQ, even before 9/11, to transfer a portion of its exposed assets into untraceable precious commodities. This process reportedly began as early as 1998 when freezing actions were first initiated in the US and EU against the Taliban. This reportedly included transfers into commodities such as gold, diamonds, tanzanite and other precious minerals. These precious commodities, while of high value, are also small in size and therefore easy to store and transport; qualities well suited to AQ purposes. Moreover, for the most part they retain their value consistently over long periods of time and can also be released into the market in small quantities to avoid arousing suspicion.

Financial Institutions

AQ itself probably did not use the formal financial system to store or transfer funds internally after it moved to Afghanistan appears to contradict the reference to conversion of funds into precious commodities in the preceding paragraph. Furthermore the Afghan banking system was rudimentary at best, and the increased scrutiny after the East Africa bombings and the UN resolutions against bin Laden and the Taliban made the use of such institutions problematic.

Bulk Cash Smuggling / Couriers

According to US Treasury, former Under Secretary Stuart Levey: "As the formal and informal financial sectors become increasingly inhospitable to financiers of terrorism, we have witnessed an increasing reliance by AQ and terrorist groups on cash couriers. The movement of money via cash couriers is now one of the principle methods that terrorists use to move funds." AQ use couriers because they provide a relatively secure way to move funds. Couriers are typically recruited from within AQ and can maintain a low profile, perhaps because

of their background, language skills, ethnicity, or documentation, and so, ideally, no outsiders are involved or have knowledge of the transactions. Indeed even the couriers usually do not know the exact purpose of the funds. A single courier or several couriers might be used, depending on the route and the amount of money involved. Money is collected from a hawaladar, financial facilitator, or donor, and taken to its destination. For example, AQ reportedly used a Pakistani-based money changer to move US\$1mio from the UAE to Pakistan, at which point the money was couriered across the border into Afghanistan.

The 9/11 transaction also provides a good example of Al-Qaeda's use of couriers. Khalid Sheikh Mohammad described as the "principal architect of 9/11 attacks" in the final Report of the National Commission on Terrorist Attacks Upon the US delivered a large amount of cash, perhaps US\$120,000, to the plot facilitator Abdul Aziz Ali in Dubai; Ali then used the cash to wire funds to the hijackers in the US. Since 9/11 core AQ operatives have relied on cash transactions involving trusted hawaladars and couriers. The hawala network that existed prior to 9/11 seems to have been largely destroyed. Several of the main hawaladars who were moving money for AQ before 9/11 have been detained, and the identities of others have been revealed in seized records. AQ may have developed relationships with other hawaladars, and it most likely uses them to move some of its money. However major cash transfers apparently are done by trusted couriers or, for added security, by the main operatives themselves. Some couriers may be carrying information (although not specific operational details) as well as cash. The use of couriers has slowed down AQs movement of money considerably, with the physical transportation of cash over long distances necessarily taking much longer than electronic transactions such as wire transfers. In addition, there is evidence that significant delays in moving money, especially to AQ operatives in far-flung parts of the world, have been caused by the limited supply of trusted couriers.

Today AQ is known to have cells operating worldwide, and has executed noteworthy attacks in Africa, Asia, Europe, and North and South America. AQ, in any form, remains a dangerous threat to peace and stability throughout the world.

Al-Qaeda largely operates through its 3 main affiliates; Al-Qaeda in the Arabian Peninsula (AQAP); Al-Qaeda Organisation in the Islamic Maghreb and Al-Qaeda Organisation in the Land of the Two Rivers but can also count as allies the following terrorist groups amongst others: Abu Hafs al-Masri Brigade; Abu Sayyaf Group; al-Gama'a al-Islamiyya; Ansar al-Islam; Armed Islamic Group; Eastern Turkestan Islamic Movement; Egyptian Islamic Jihad; Harakat ul-Mujahideen; Islamic Jihad Union (Uzbekistan); Islamic Movement of Uzbekistan; Jaish-e-Mohammad; Jemaah Islamiya; Lashkar-e-Taiba; Libyan Islamic Fighting Group; and the Taliban. It also operates by inspiring others who are not part of

any criminal organisation to become radicalised and to take independent action.

The Afzidi Network - Afghanistan/Pakistan

The Afzidi Network, based in the region transecting the northern Pakistan-Afghanistan border, is centred on clan affiliations inherent in the region's culture and social make-up. The region is home to a culturally and ethnically distinct group known as Pashtuns, to whom clan affiliations, a strict code of honour and martial traditions are a longstanding way of life. It is the centrality of clan loyalties to the region's culture that is credited in large part for the success of its affiliates in dominating the territory's drug trade, providing as it does an automatic level of cohesion absent in many other areas of the world. Nor is it wholly surprising that the region should boast an organisation capable of resisting the law enforcement of both indigenous and foreign governments; for centuries Pashtun tribes have successfully thwarted all incursions by foreign powers. For instance during British imperial reign in India, the North West Frontier Province was never fully conquered and became known amongst soldiers simply as "the Grim", so ferocious were its inhabitants.

In more recent times occupations by Russian forces and a US led coalition have both failed to quell insurgency in the region. Even today the Pakistani central government cannot operate in the North West Frontier Province without the permission of local clan leaders. Presently the Afzidi clan network specialises in the smuggling of heroin and other opium based narcotics. The profitable revenue garnered in this way has allowed the clan's leader, Haji Ayub Afzidi, to amass considerable personal wealth and construct a \$2 million luxury home in Pakistan's Landi Kotal area. For Afzidi the man, working life began rather inauspiciously as a truck driver. His first foray into criminal activity came with his successes smuggling gold.

During the 1980s Afzidi formed connections with the Pakistan military, using the channels of his smuggling network to aid in the supply of arms to Mujahideen rebels opposing Soviet rule in Afghanistan. These selfsame channels also allowed Afzidi to move opium out of Afghanistan and into Pakistan, where it was refined and manufactured into heroin. From Pakistan it would then be exported to other areas of the world.

While Afzidi has not proven immune to prosecution, his relationship with law enforcement is a complex one. In 1995 Afzidi was extradited to America, where in 1996 he was convicted of narcotics smuggling charges. Afzidi served 3 of the 5 year sentence, before being sent back to Pakistan, where he immediately faced another trial for exporting 6.5 tons of hashish seized by law enforcement personnel in Antwerp, Belgium. Afzidi received a sentence of 7 years imprisonment, however after just a few weeks he was released without explanation.

Special Focus 9

Taliban - Afghanistan

The Taliban, sometimes spelt Taleban, is an Islamist militant terrorist and political group that ruled large parts of Afghanistan and its capital, Kabul, as the Islamic Emirate of Afghanistan from 1996 until 2001. It gained diplomatic recognition from only three states:

Pakistan, Saudi Arabia, and the United Arab Emirates. The predominantly Pashtun Taliban emerged in the latter part of 1994 as a 'messianic' movement made up of talib (students) from Madrassas, who were living as refugees in Pakistan. The group first came to prominence in 1994, when they were appointed by the Pakistani administration to protect a convoy attempting to open up a trade route between Pakistan and Central Asia.

The origin of the Taliban movement in Southern Afghanistan can be traced back to another incident in the same year, when a group of talib from the Darul Uloom Haqqania madrassa in Akora Khattak in Pakistan's North Western Frontier Province (NWFP), led by their teacher, Mullah Mohammed Omar, successfully battled a local Mujahideen 'commander' who had reportedly assaulted three women in Kandahar. Gradually, the Taliban, amply supported by Pakistan, evolved into a military force and went on to capture a large part of Afghanistan, after overthrowing the regime of Burhanuddin Rabbani. Their military campaign had rapid successes and in the first three months, they captured 12 out of the 36 regions of Afghanistan. These campaigns involved little hard fighting, as commanders simply switched sides after lucrative arrangements with the Taliban had been hammered out. These successes were primarily in the Pashto belt where the group could rely on considerable support from its ethnic community. Having established control over a majority of the poppy fields located in Southern Afghanistan, they began to expand westward towards Herat and northward towards Kabul. In the captured areas, the Taliban imposed strict "Islamic" laws and also disarmed the populace. In 1996, they stormed and captured Kabul, the capital of Afghanistan and immediately imposed their version of Sharia law (Islamic law). Perhaps most striking amongst the violence perpetrated by the Taliban was the torturing and public hanging of former President Najibullah, who had taken shelter in the UN premises. By September 1996, the Rabbani regime had also left Kabul without any resistance and the Taliban militia had assumed power in Afghanistan. The Taliban by that time were controlling 27 provinces of Afghanistan, and

the remaining three in the north were under the control of Uzbek-warlord Abdur Rashid Dostum. As a result of their many military successes, the Taliban's ranks had swelled over from a mere 2,500 to over 30,000 cadres.

The Taliban is widely acknowledged to be a creation of Pakistan and its external intelligence agency, the Inter Services Intelligence (ISI). This factor goes a long way in explaining the swift military successes of the Taliban against the non-Pashtun Afghan forces in campaigns in which both Pakistani Army officers and men (serving as well as retired) were involved. The Taliban's military campaign in Afghanistan commenced after an announcement by Pakistan that it would open a trade route through Afghanistan to Central Asia (former Soviet Central Asian Republics: Tajikistan, Uzbekistan, Turkmenistan). Pakistan ascertained that the Tajik-dominated government in Kabul posed a threat to their ambitions for a trade route through the area by keeping the Pashtuns, uncontrolled by any state, in a condition of agitation. However, the stakes for both Pakistan and Saudi Arabia were much more than trade routes; potentially lucrative oil and gas pipelines were also involved.

While in power, the Taliban enforced one of the strictest interpretations of Sharia law ever seen in the Muslim world. It was however a doctrine that received both support and criticism from the Islamic community; Al-Qaeda for instance reinforced the regime with militants from across the Middle-East and Central Asia, while some Muslim scholars condemned the Taliban for their opposition to the education of women. Indeed the Taliban's ill-treatment of women became notorious amongst the international community. Nonetheless the Taliban maintained allies in the Arab community, Pakistani's military and a community of Islamic militants across Arab and Central Asian countries. The high level of support for the Taliban regime from the more fundamental elements of the Islamic community is well illustrated by the fact that in 2001 as they continued to battle Afghanistan's remaining anti-Taliban forces, amongst a 45,000 strong Taliban force, only an estimated 14,000 were Afghans; the rest were drawn from other nationalities, prominently from Arab countries and Pakistan.

After the September 11 attacks, the US made the following demands of the Taliban, and refused to discuss them: Deliver to the US all of the leaders of Al-Qaeda. Release all foreign nationals who have been "unjustly imprisoned". Protect foreign journalists, diplomats, and aid workers. Close immediately every terrorist training camp, hand over every terrorist and their supporters to appropriate authorities, and allow the US full access to terrorist training camps for inspection. The US petitioned the international community to back a military campaign to overthrow the Taliban. The U.N. issued two resolutions on terrorism after the Sept. 11 attacks. The resolutions called on all states to "[increase] cooperation and full implementation of the relevant international conventions relating to terrorism" and specified consensus recommendations for all countries. The

Security Council did not however authorize military intervention in Afghanistan of any kind, and nowhere in the UN resolutions did it say military operations in Afghanistan were justified or conformed to international law. Despite this, NATO approved a campaign against Afghanistan as self-defence against armed attack. On September 21, the Taliban responded to the ultimatum, promising that if the US could bring evidence that bin Laden was guilty, they would hand him over, stating that they had no evidence linking him to the September 11 attacks. On September 22, the United Arab Emirates, and later Saudi Arabia, withdrew recognition of the Taliban as Afghanistan's legal government, leaving neighbouring Pakistan as the only remaining country with diplomatic ties. On October 4, the Taliban agreed to turn bin Laden over to Pakistan for trial in an international tribunal that operated according to Islamic Sharia law, but Pakistan blocked the offer as it was not possible to guarantee his safety. On October 7, the Taliban ambassador to Pakistan offered to detain bin Laden and try him under Islamic law if the US made a formal request and presented the Taliban with evidence. A Bush administration official, speaking on condition of anonymity, rejected the Taliban offer, and stated that the US would not negotiate their demands.

As a response to the attacks of September 11 2001 the Taliban regime was overthrown by the US led military campaign known as Operation Enduring Freedom. The US was supported by the International Security Assistance Force (ISAF), a fighting force made up of soldiers from the member states of the North Atlantic Treaty Organisation. The Taliban mostly fled to neighbouring Pakistan where it regrouped as an insurgency movement to fight the Islamic Republic of Afghanistan (established in late 2001) and the NATO-led International Security Assistance Force (ISAF).

Today the Taliban operate in Afghanistan and northwest Pakistan. US officials say one of their headquarters is in or near Quetta, Pakistan. The Taliban engage in attacks against the civilian population; according to a report by the UN, the Taliban were responsible for 2,477 civilian casualties (76% of all casualties) in the first six months of 2010.

Noorzai Organisation - Afghanistan/Pakistan

Since around 1990 Hajji Bashir Noorzai, an Afghan drug lord who controlled opium fields in Afghanistan, led an international-heroin trafficking organisation, producing the class A drug in Afghanistan and Pakistan, from where it was smuggled to other countries, including the US. Opium was first transported from fields in Afghanistan to Noorzai's laboratories in Pakistan, where it was made into heroine. This involvement in the illicit drugs trade, estimated by the Centre for Strategic and International Studies in Washington to be worth \$28 million annually, allowed him to mobilize forces against the Russian occupation of Afghanistan in the 1980s, and following their withdrawal to govern western Kandahar with a de facto administration. Politically

Noorzai was aligned with the Taliban in Afghanistan during their rule, providing through his organisation weapons, manpower and demolition services to the party. The strength of the allegiance between the Taliban and Noorzai is clearly demonstrated by the Afghan governments seizure of a truck-load of morphine in 1997; a cargo that was speedily returned to Noorzai with the personal apologies of Mullah Mohammad Omar, leader of the Taliban. It is also believed by the Centre for Strategic and International Studies that Noorzai acted as the primary heroin supplier for bin Laden. The allegiance between Noorzai and the Taliban was not however seemingly permanent, with Noorzai meeting US military personnel in 2001. In 2002 Noorzai demonstrated his break with the Taliban when he handed over 15 truckloads of their weaponry to the US. These weapons were alleged to have been hidden in his tribe's territory by the Taliban in order to resist the US led invasion. In 2005, despite his previous cooperation with the US, Noorzai was arrested by agents of the Drug Enforcement Administration in New York¹⁶ and stood trial for his role in establishing and directing a narcotics distribution network that encompassed the US capital from as early as 1990. The Grand Jury indictment of 2005 against Noorzai in the US stated that the Noorzai Organisation met in Pakistan in 2001 to discuss methods of transporting heroin to the US. In trials that reached their conclusion in 2009 Noorzai was found guilty of conspiracy to import US\$50mio worth of heroin into the US and other countries, manufacturing heroin, and one count of distributing heroin. On 3 April 2009 the man dubbed the "Pablo Escobar of heroin trafficking in Asia" was sentenced to life imprisonment by a US Judge.

The Khan Cartel - Afghanistan/Pakistan

This drug manufacturing and smuggling organisation is led by Haji Juma Khan, an ethnic Baluch from the Nimroz Province of Afghanistan. Like Noorzai, Khan is known to have strong links with the Taliban. During the period of Taliban rule in Afghanistan Khan operated as a provincial drug smuggler, however in the power vacuum that followed the ruling party's fall he rose to national prominence. For a short period Khan was detained by US forces after their conquest of the country, however he was soon released despite an appreciation of his involvement in drug trafficking. It is believed by many sources that Khan then went on to run the opium distribution network of the Taliban insurgents, thereby financing continued resistance to coalition forces in the region. The headquarters of Khan's operations were located under the cover of his travel agency in Quetta, Pakistan. Arrested in 2008 in Indonesia, he was deported to America to face trial under federal narco-terrorism laws. The waters of the trial have however been muddied somewhat by the revelation that Khan has served as an American informer over many years and plea negotiations between Khan and US authorities continue still. In the meantime, Imam Bheel is thought to have taken over the operation, himself at large though designated as a drug kingpin by US authorities in 2009.

Pakistan

The Islamic Republic of Pakistan sits at the crossroads of the strategically important region of South Asia, Central Asia and Western Asia bordering the Arabian Sea, between India on the east and Iran and Afghanistan on the west and China in the north.

Pakistan covers an area which is slightly less than twice the size of the US State of California. With a population of over 190 million people, it is the sixth most populous country in the world and has the largest Muslim population after Indonesia. The national language of Pakistan is Urdu but Urdu and English both are commonly used for official purposes. The country remains predominantly rural with almost two thirds of the population living in rural areas. The province of Punjab is the largest province on population basis.

Historically the territory of modern Pakistan has been ruled by numerous empires and dynasties and underwent successive invasions in subsequent centuries from the Persians, Greeks, Scythians, Arabs, Afghans, and Turks. The British came to dominate the region in the 18th century. In 1947 the partition of British India amongst the largest and most tragic displacement of people in the world history, created the independent Muslim state of Pakistan. However, the separation of the Muslim dominated Pakistan and Hindu India did not lead to a satisfactory resolution of the territorial issues and both countries fought three wars with the last of which in 1971 resulted in East Pakistan becoming a separate state of Bangladesh. India's nuclear weapons testing were seen as a threat to Pakistan which in turn conducted its own nuclear tests. Today both States are Nuclear States.

Economically, in contrast to its arch rival India, decades of internal political disputes and low levels of foreign investments have resulted in slow growth and underdevelopment in much of Pakistan. Agriculture accounts for more than one-fifth of output and two-fifths of employment. The UN estimated poverty in 2011 at almost 50% of the total population. Remittances from overseas workers, averaging about US\$1 bio a month (as of 2011) remain a crucial source of income for Pakistan's economy.

Pakistan faces significant risks of money laundering and even more significant risks of terrorism financing. Authorities acknowledge that Pakistan's economy is abused to support terrorist financing and that a significant source of terrorist funds is derived from the proceeds of crime (including bank robbery, kidnap for ransom, and

proceeds of drug trafficking flowing from Afghanistan). Pakistan is a significant transit area for Afghan drugs, including heroin, opium, and hashish, bound for Iran, Western markets, the Gulf States, Africa, and Asia. Authorities identified also cases of cash couriers and the misuse of charities/non-profit organisations as facilitating terrorist financing. While charities/non-profit organisations play a very important role in Pakistan's economy and society, parts of the non-profit organisation pose a significant terrorist financing risk, in particular in border regions with high level of terrorist activity.

Pakistani authorities are widely thought to have had ties to domestic militant groups that have largely focused their efforts abroad, as in Afghanistan and India, but post 9/11 the pressure to shut down support and to counter the Taliban and Al-Qaeda has placed the Pakistan authorities in a difficult position. Whilst the official position of the Pakistan government is to support the so called war on terror, it was in May 2011, Al-Qaeda leader bin Laden was killed by a US raid at a compound not far from Islamabad, raising new questions about Pakistan's commitment to fighting terrorism. Meanwhile, leadership elements of Al-Qaeda and the Taliban, along with other terrorist groups, have made Pakistan's semi-autonomous tribal areas their home, and now work closely with a wide variety of Pakistani militant groups, like the Haqqani Network, which in September 2012 was added to the US list of designated terrorist organisations.

Whilst there are many terrorist groups operating out of Pakistan, most tend to fall into one of five distinct categories as laid out by Ashley J. Tellis, a senior associate at Carnegie Endowment for International Peace, in a January 2008 testimony before a US House Foreign Affairs subcommittee. These are, sectarian groups engaged in violence within Pakistan; Anti-Indian groups operating with the alleged support of the Pakistani military and the intelligence agency Inter-Services Intelligence (ISI) and are largely active in Kashmir; Afghan Taliban; Al-Qaeda and its affiliates and the Pakistan Taliban.

Even with 5 broad categories there are some other militant groups that do not fit into any of the above categories—for instance, secessionist groups such as the Balochistan Liberation Army in the southwest province of Balochistan. Also, a new militant network, often labeled the Punjabi Taliban, has gained prominence after the major 2008 and 2009 attacks in the Punjabi cities of Lahore, Islamabad, and Rawalpindi and groups based in North Pakistan trying to agitate in the Central Asian Republic.

Hizb-e Islami Gulbuddin - Pakistan/Afghanistan

Hizb-e Islami Gulbuddin (HIG) emerged in 1977, founded by Gulbuddin Hekmatyar to liberate Afghanistan from the influence of foreign forces, overthrow the Afghan government, and establish a fundamentalist Islamic state. Based in Eastern Afghanistan and the tribal areas in Western Pakistan, HIG was known to be one

of the most radical mujahideen groups in the Afghan resistance during the Soviet occupation, with close ties to the Taliban, bin Laden and Al-Qaeda. Though anti-American in principle, Hekmatyar displayed pragmatism in accepting millions of dollars worth of American funding and equipment to help the Mujahideen fight the Soviets in Afghanistan. In the early 1990s, HIG operated several terrorist training camps in Afghanistan. After training, terrorists would be sent to assist Mujahideen in other parts of the world where there was religious conflict. Following bin Laden's expulsion from Sudan in 1996, Hekmatyar offered bin Laden safe haven. Since the US-led coalition invaded Afghanistan in 2001, Hizb-e Islami Gulbuddin has led terrorist attacks against the US, its coalition partners, the Afghan Transitional Administration (ATA) and the UN and NGOs as well.

Jamiat-e-Islami - Pakistan/Afghanistan

Jamiat-e Islami was an Afghan political party, whose military wing was established and led in 1979 by Ahmad Shah Massoud, the key Afghan resistance leader against Soviet occupation, to fight the Communist government and their Soviet allies. This group grew to control multiple provinces and included thousands of fighters. The Soviet Army launched a series of major offensives to attempt to destroy their forces, but they were unable to engage most of Massoud's men. After the withdrawal of the Soviet troops in 1988, the Mujahideen groups continued to wear down government forces; in 1992 the communist government collapsed entirely. Jamiat's forces were among the first to enter Kabul. Meanwhile, a peace and power-sharing agreement among the leadership of the Afghan political party leaders led to a tentative agreement to appoint Burhanuddin Rabbani, who had spent the civil war in exile, as interim president. The peace agreement was called the Peshawar Accords.

Gulbuddin Hekmatyar however, did not support the peace agreement despite the fact that he was repeatedly offered the position of prime minister. Subsequently his Hezb-e Islami Gulbuddin attacked the new interim government and the capital of Kabul. With other groups entering the conflict such as Hezb-i Wahdat and Ittihad-i Islami as well as Junbish-i Milli fighting against the Afghanistan Government, mainly for control of Kabul, the conflict would allow the Taliban, to consolidate its control of much of southern Afghanistan and then to advance on Kabul.

In March 1995, Massoud handed the Taliban their first major loss but they regrouped and together with bin Laden's forces, they launched another offensive in mid-1996, which led Massoud to retreat and hand Kabul to the Taliban. Following the capture of Kabul, the major Mujahideen factions put aside their feuds and formed the United Islamic Front for the Salvation of Afghanistan (the United Front), commonly known in the west as the Northern Alliance, with Rabbani, officially becoming its political leader. On 9 September 2001, just

two days before Al-Qaeda's attack on America, Massoud was assassinated by two suicide bombers. Immediately afterwards Taliban forces launched a major offensive against Northern Alliance positions. Mohammed Qasim Fahim was chosen to succeed Massoud as leader of Jamiat's military wing and repulsed the Taliban offensive. With extensive assistance from an American-led coalition in October and November 2001 Northern Alliance forces recaptured most of Afghanistan. Jamiat-e-Islami, amongst others given its anti-Soviet stance is designated by the Russian Federation as a terrorist organisation.

Quetta Shura - Pakistan/Afghanistan

Quetta Shura is a militant organisation composed of the top leadership of the Afghan Taliban, based since about 2001 in Quetta in Balochistan province of Pakistan. It was formed after forces led by the US attacked the Taliban in Afghanistan in November 2001, when the senior leadership of Taliban including Mullah Mohammed Omar, the spiritual leader of Taliban and one time Amir-al-Mu'min of Afghanistan escaped. Baluchistan is a province in Western Pakistan, is off-limits to the Pakistani military because ethnic Baluchs have fiercely resisted central government intrusion. American officials believe that the Quetta Shura gets support from parts of Pakistan's Inter-Services Intelligence (ISI) and its senior leaders are in hiding in Pakistan as some of its senior officials believe that leaders such as Mullah Omar would be valuable assets if the Taliban were to regain power after a withdrawal of US forces from Afghanistan.

Tehrik-e Taliban Pakistan/Pakistan Taliban (TTP) - Pakistan/Afghanistan

Tehrik-e Taliban Pakistan (TTP) is a Pakistan-based terrorist organisation formed in 2007 in opposition to Pakistani military efforts in the Federally Administered Tribal Areas. Previously disparate militant tribes agreed to cooperate and eventually coalesced into the TTP. TTP was led by Hakimullah Mehsud since August 2009, until his death in a US drone attack in November 2013. TTP's goals include overthrowing the Government of Pakistan by waging a terrorist campaign against the civilian leader of Pakistan, its military, and NATO forces in Afghanistan. TTP uses the tribal belt along the Afghan-Pakistani border to train and deploy its operatives, and the group has a symbiotic relationship with Al-Qaeda. TTP draws ideological guidance from AQ, while AQ relies on TTP for safe haven in the Pashtun areas along the Afghan-Pakistani border. This arrangement gives TTP access to both AQ's global terrorist network and the operational experience of its members.

TTP has carried out and claimed responsibility for numerous terrorist acts against Pakistani and US interests, including a December 2009 suicide attack on a US military base in Khowst, Afghanistan, which killed seven US citizens, and an April 2010 suicide bombing against the US Consulate in Peshawar, Pakistan, which killed six Pakistani citizens. TTP is suspected of being involved in the 2007 assassination of former Pakistani Prime Minis-

ter Benazir Bhutto. TTP claimed to have supported the failed attempt by Faisal Shahzad to detonate an explosive device in New York City's Times Square on May 1, 2010. TTP's claim was validated by investigations that revealed that TTP directed and facilitated the plot. Throughout 2011, TTP carried out attacks against the Government of Pakistan and civilian targets, as well as against US targets in Pakistan. Attacks in 2011 included: a March bombing at a gas station in Faisalabad that killed 31 people; an April double suicide bombing at a Sufi shrine in Dera Ghazi Khan that left more than 50 dead; a May bombing of an American consulate convoy in Peshawar that killed one person and injured twelve; a May siege of a naval base in Karachi; the May assassination of the PNS Mehran Saudi diplomat in Karachi. On 12 May 2011, the Pakistani Taliban claimed responsibility for bombing a paramilitary academy that killed eighty people and injured more than 100 and a September attack against a school bus that killed four children and the bus driver.¹⁷ TTP is believed to raise most of its funds through kidnapping for ransom and operations that target Afghanistan-bound military transport trucks for robbery. Such operations enable TTP to steal military equipment, which they then sell in Afghan and Pakistani markets.

Haqqani Network - Pakistan/Afghanistan

The Haqqani Network, whose operations and relations straddle the Afghanistan, Pakistan border has proven a valuable ally for some of the Pakistan Taliban's (TTP) illicit pursuits. The Haqqanis have not only fought alongside the TTP and Afghan Taliban in Afghanistan, they have also served as an influential mediator between the TTP and officials in Islamabad. Pakistan has long been a beneficiary of the Haqqanis who have helped Islamabad manage militant groups in the region and provided leverage against India in the struggle over Kashmir. Maulvi Haqqani and his son Sirajuddin Haqqani led the group first established to fight the Soviet Invasion of Afghanistan. Two notable foreign fighters both began their careers as volunteers for the Haqqanis, being trained to fight the Soviets. These were bin Laden and his mentor Abdullah Azzam. Later Al-Qaeda and the Haqqani Network evolved together and have remained intertwined with the main ideological difference being Al-Qaeda's global aspirations versus the Haqqani's preferring local ones. In September 2012 the US designated the network a US foreign terrorist organisation. After this announcement the Pakistani Taliban issued a statement informing that the Haqqani Network was not a separate organisation but a member of the TTP. The Network's funding is from local extortion and from private donations.

Tahreek-e-Nafaz-e-Shariat-e-Mohammadi - Pakistan/Afghanistan

The Tehreek-e-Nafaz-e-Shariat-e-Mohammadi (TNSM); (Movement for the Enforcement of Islamic Laws) was founded in 1992 with the primary objective of the imposition of strict Sharia Law in Pakistan, on the lines of the Taliban in Afghanistan.

The TNSM was one of five terrorist groups that were proscribed by former President Pervez Musharraf in January 2002. Maulana Sufi Mohammed (now imprisoned in Pakistan) is the leader of the TNSM. He was an active leader of the Jamiat-e-Islami in the 1980s. He quit the Jamiat in 1992 to form the TNSM. He is reported to have organised thousands of people to fight the Northern Alliance (NA) in Afghanistan after the defeat of the Taliban in 2001. However, a majority of them were either killed or arrested by the NA in Afghanistan. Some, including Sufi Mohammed, managed to return to Pakistan, only to be arrested. Since Sufi Mohammad's imprisonment, his son-in-law Maulana Fazalullah is reportedly now leading the TNSM.

The TNSM headquarters is located in the North West Frontier Province (NWFP), operates primarily in the tribal belt, such as Swat and the adjoining districts of the NWFP. Since the imprisonment of Sufi Mohammed and the proscription by the Pakistani Government, the TNSM has been largely defunct. The Government believes that the TNSM has links with the Taliban militia in Afghanistan.

Lashkar I Jhangvi (LJ) - Pakistan/Afghanistan

Lashkar I Jhangvi was designated as a US Foreign Terrorist Organisation on 30 January 2003, Lashkar I Jhangvi (LJ) is the militant offshoot of the Sunni Deobandi sectarian group Sipah-e-Sahaba Pakistan. LJ focuses primarily on anti-Shia attacks and other attacks in largely Sunni Pakistan and Afghanistan, and was banned by Pakistan in August 2001 as part of an effort to rein in sectarian violence. Many of its members then sought refuge in Afghanistan with the Taliban, with whom they had existing ties. After the collapse of the Taliban as the ruling government in Afghanistan, LJ members became active in aiding other terrorists, providing safe houses, false identities, and protection in Pakistani cities, including Karachi, Peshawar, and Rawalpindi. LJ works closely with the Pakistani Taliban (TTP).

LJ specialises in armed attacks and bombings and has admitted responsibility for numerous killings of Shia religious and community leaders in Pakistan.

In January 1999, the group attempted to assassinate former Prime Minister Nawaz Sharif and his brother Shabaz Sharif, Chief Minister of Punjab Province. Media reports have also linked LJ to attacks on Christian targets in Pakistan, including a March 2002 grenade assault on the Protestant International Church in Islamabad that killed two US citizens. Pakistani authorities believe LJ was responsible for the July 2003 bombing of a Shia mosque in Quetta, Pakistan. Authorities also implicated LJ in several sectarian incidents in 2004, including the May and June bombings of two Shia mosques in Karachi, which killed more than 40 people. LJ was very active in 2011. The most notable attack occurred on December 6, in Kabul, Afghanistan, when a suicide bomber detonated an improvised explosive device in a

crowd of Shia mourners, killing 48 civilians – including 12 children – and wounding 193. LJ claimed responsibility. In a particularly tragic attack on 29 September, in Balochistan, LJ operatives ordered Shia pilgrims off a bus and shot dead 29 victims. An hour after the initial attack, gunmen killed family members travelling to retrieve the victims of the first attack. Additional 2011 attacks included: a January firebombing attack that injured four police officers, and six civilians, including three children; a May attack that killed eight civilians and wounded 15; another May attack that killed two police officers and wounded three; and a July 30 attack that killed 11 civilians and wounded three.

Funding comes from wealthy donors in Pakistan as well as the Middle East, particularly Saudi Arabia. The group also engages in criminal activity to fund its activities, including extortion and protection money.

Islamic Jihad Union (IJU) - Pakistan/Afghanistan

The Islamic Jihad Union was designated as a US Foreign Terrorist Organisation on 17 June 2005, The Islamic Jihad Union (IJU) is a Sunni extremist organisation that splintered from the Islamic Movement of Uzbekistan (IMU). The IJU, based in Pakistan, primarily operates against Coalition Forces in Afghanistan and continues to pose a threat of attacks in Central Asia. The group claimed responsibility for attacks in March and April 2004, targeting police at several roadway checkpoints and at a popular bazaar, killing approximately 47 people, including 33 IJU members, some of whom were suicide bombers. In July 2004, the group carried out near-simultaneous suicide bombings of the Uzbek Prosecutor General's office and the US and Israeli Embassies in Tashkent. In September 2007, German authorities disrupted an IJU plot by detaining three IJU operatives, including two German citizens. Foreign fighters from Germany, Turkey, and elsewhere in Europe continued to travel to the Afghan-Pakistan border area to join the IJU to fight against US and Coalition Forces.

Sipah-e-Sahaba/Millat-e-Islamia - Pakistan

Earlier termed Anjuman Sipah-e-Sahaba, the Sipah-e-Sahaba Pakistan (SSP) is a Sunni terrorist group that has primarily targeted the minority Shia community in Pakistan. The group in its earlier times contested elections in 1993 before being proscribed by then President Pervez Musharraf in 2002. The group is reported to have been renamed as Millat-e-Islamia Pakistan after the proscription. The SSP is reported to have approximately 3,000 - 6,000 trained activists who indulge in various kinds of violent sectarian activities, which are primarily directed against the Shias. Most SSP activists come from the Punjab.

The SSP is also reported to be closely linked to the Jaish-e-Mohammed (JeM), a Pakistan-based terrorist outfit active in Jammu and Kashmir. The SSP draws support, inspiration and assistance from various political parties in Pakistan, primarily the Jamiat-e-Islami (JeI) and the Jamaat-Ulema-e-Islam (JuI). The JuI is associ-

ated with running a large number of Madrassas all over Pakistan from where recruits for the HuM, SSP and Taliban are provided. The SSP reportedly receives significant funding from Saudi Arabia and through wealthy private sources in Pakistan. Funds are also acquired from various sources, including Zakat and donations from various Sunni extremist groups. Other sources include donations through local Sunni organisations and trusts, Madrassas and study circles, and contributions by political groups. Most of the foreign funded Sunni Madrassas in Pakistan are reportedly controlled by the SSP.

Kashmir

The independence of India in 1947 resulted in partition in the Indian sub continent, largely divided on the basis of religious demographics. This led to the creation of the sovereign states of the Pakistan (that later split into Pakistan and Bangladesh) and of India. The vast majority (over 95%) of Pakistan consider themselves Muslims whilst over 85% of India identifies as Hindu's. The partition led to a struggle between the newly constituted states of India and Pakistan and displaced up to 12.5 million people with estimates of loss of life varying from several hundred thousand to a million (most estimates of the numbers of people who crossed the boundaries between India and Pakistan in 1947 range between 10 and 12 million) and other atrocities.

The violent nature of the partition created an atmosphere of mutual hostility and suspicion between India and Pakistan that plagues their relationship to this day. A long-standing territorial dispute between India and Pakistan over the Kashmir region, the northwestern most region of South Asia, is known as the "Kashmir Conflict". India claims the entire state of Jammu and Kashmir and as of 2010, administers approximately 43% of the region, including most of Jammu, the Kashmir Valley, Ladakh, and the Siachen Glacier. India's claims are contested by Pakistan, which controls approximately 37% of Kashmir, namely Azad Kashmir or Pak Occupied Kashmir and the northern areas of Gilgit and Baltistan. The remaining part is claimed by China. At the time of partition, Jammu and Kashmir had a predominantly Muslim population, while having a Hindu ruler (Maharaja Hari Singh.) On partition Pakistan expected Kashmir to be annexed to it but it went to India. India has officially stated that it believes that Kashmir is an integral part of India, though the Prime Minister of India, Manmohan Singh, stated after the 2010 Kashmir Unrest that his government is willing to grant autonomy within the purview of Indian constitution to Kashmir if there is consensus on this issue. Pakistan officially maintains that Kashmir is the "jugular vein of Pakistan" and a currently disputed territory whose final status must be determined by the people of Kashmir. Certain Kashmiri independence groups believe that Kashmir should be independent of both India and Pakistan.

India and Pakistan have fought at least three wars over Kashmir, including the Indo-Pakistani Wars of 1947, 1965 and 1997. There was also a high-grade armed conflict in 1991 which the Pakistani forces occupied Indian-controlled Kargil range allegedly to provide cover for terrorists to cross over into Indian territory and were forced to retreat after suffering heavy losses.

Starting in the late 1980s the struggle has become increasingly more militant with the presence of Mujahideen insurgents and the Pakistani defeats adding to the bitterness. India alleges the pro-Kashmir insurgents are supported by Islamist terrorist groups from Pakistan-administered Kashmir and Afghanistan, fighting to make Jammu and Kashmir, a part of Pakistan. India claims Pakistan is supplying munitions to the terrorists and training them in Pakistan. These claims were bolstered by Osama bin Laden's 2002 'Letter to American People' wherein he stated that one of the reasons he was fighting America is because of its support of India on the Kashmir issue. American special forces were sent into Indian-administered Kashmir in 2002 to hunt for bin Laden following reports that he was being sheltered by the Kashmiri militant group.

Pakistan has often used proxy terrorists groups to achieve its foreign policy goal. The 2008 Mumbai attacks brought the Kashmir issue to light again. Twelve coordinated shooting and bombing attacks occurred across Mumbai at the hands of Islamist terrorists who were trained in and came from Pakistan. Ajmal Kasab, the only attacker who was captured alive, later confessed upon interrogation that the attacks were conducted with the support of Pakistan's ISI. The attacks killed 164 people and wounded at least 308. The following are the most significant groups in the region:

Lashkar-e-Tayyiba (LeT) - Pakistan/Kashmir

Lashkar e-Tayyiba (LeT), whose name translates to mean 'Army of the Pure', is one of the largest and most proficient of the Kashmiri-focused militant groups. LeT was founded in 1987 by Professor Hafiz Saeed as the militant wing of the Islamist organisation Jamat-ud-Dawa. Saeed was a respected ulama of the relatively small Ahl-e-Hadith movement based mainly in Pakistan that advocated an Islamic purification of society. Having gained military experience during the Afghan jihad, Saeed represented the ideal blend of religious authority and military expertise to lead a group of Islamic jihadists. The jihad espoused by Saeed and the LeT, and that advocated by Al-Qaeda should not however be taken as one and the same phenomenon. Where AQ seeks to wage war against a "Zionist-Crusader alliance", the Pakistan based LeT's struggle is against a "Hindu-Zionist-Crusader alliance". In this respect LeT attacks against the Indian government can be seen as dating back to the divisive policy adopted by colonisers. The purported objective of LeT campaigns is to create an Islamic state in South Asia and to liberate Muslims residing in Indian administered Kashmir.

The centres of LeT recruitment, training, and support are the Punjab province of Pakistan and Pakistan administered Kashmir. The primary focus of the organisation's operations is the Kashmir jihad, a campaign the LeT gives precedence over all other Islamic jihad's as a result of both its proximity and the high ratio of Indian occupation forces to population. However the LeT's quarrel with India runs far deeper than simply the contest for Kashmir, with the group in fact intending to reassert Muslim control over the entire subcontinent. This larger goal explains why LeT attacks have not been isolated to Indian targets in Kashmir, but have struck across India, including in 2001 on the Indian Parliament and the infamous Mumbai attacks of 2008.

The Mumbai attacks consisted of 12 bombings and shootings across the capital and claimed the lives of 164 people. Upon interrogation one of the attackers Ajmal Kasab admitted that the LeT had received support from Pakistan's Inter-Services Intelligence (ISI), raising the possibility that despite official condemnation of the group, the LeT may have acted as a proxy organisation for the Pakistani government and its aggressive foreign policy towards India. This possibility was confirmed by the 2011 testimony of David Healey, a US-Pakistani who had in a previous trial pleaded guilty to plotting the Mumbai attacks, as well as an aborted LeT attack against a Danish newspaper. As a witness in the trial of Tahawwur Rana, accused of providing financial support for the LeT attacks in Mumbai, Healey asserted that Pakistan's ISI had provided the group with both moral and military aid.

LeT funds are believed to be drawn from Pakistani and Kashmiri businessmen, as well as the Pakistani diaspora community residing in the Persian Gulf and the UK. Charities in particular have provided large amounts of money for the organisation, following the Kashmir earthquake of 2005 charity collections were made in Britain under the pretext of providing aid to the stricken Kashmiri community through alleged front organisations. While some of the money may have reached their official beneficiaries, in some areas the LeT were the first group to arrive with aid. It is feared that more than half of the £5 million collected was siphoned off to fund violent LeT operations. There also remains the distinct possibility that the Pakistani ISI may have provided financial support for some LeT operations.

The exact organisation size of the LeT is unknown; however it estimated by some sources that the group possesses several thousand members. Despite the nexus of LeT activity being focused in and around the Indian subcontinent, some members are known to have fought in Chechnya and in the Philippines during the 1990s. In 2009 the organisation declared that it had ceased its violent operations and sought a peaceful resolution to the dispute over the governance of Kashmir. Nevertheless LeT is still considered to be an active terrorist group with significant military capabilities.

Jaish-e-Mohammed (JEM) - Pakistan/Kashmir

Jaish-e-Mohammed was designated as a Foreign Terrorist Organisation on December 26, 2001, Jaish-e-Mohammed (JEM) is based in Pakistan. JEM was founded in early 2000 by Masood Azhar, a former senior leader of Harakat ul-Ansar, upon his release from prison in exchange for 155 hijacked Indian Airlines hostages in India. The group's aim is to annex Indian Kashmir and expel Coalition Forces from Afghanistan, and it has openly declared war against the US. Pakistan outlawed JEM in 2002. By 2003, JEM had splintered into Khuddam-ul-Islam (KUI), headed by Azhar, and Jamaat ul-Furqan (JUF), led by Abdul Jabbar, who was released from Pakistani custody in August 2004. Pakistan banned KUI and JUF in November 2003.

JEM continues to operate openly in parts of Pakistan despite the 2002 ban on its activities. Since Masood Azhar's 1999 release from Indian custody, JEM has conducted many fatal terrorist attacks in the region. JEM claimed responsibility for several suicide car bombings in Kashmir, including an October 2001 suicide attack on the Jammu and Kashmir legislative assembly building in Srinagar that killed more than 30 people.

The Indian government has publicly implicated JEM, along with Lashkar e-Tayyiba, for the December 2001 attack on the Indian Parliament that killed nine and injured 18. In 2002, Pakistani authorities arrested and convicted a JEM member for the abduction and murder of US journalist Daniel Pearl. Pakistani authorities suspect that JEM members may have been involved in the 2002 anti-Christian attacks in Islamabad, Murree, and Taxila that killed two Americans.

In December 2003, Pakistan implicated JEM members in the two assassination attempts against President Musharraf. In 2006, JEM claimed responsibility for a number of attacks, including the killing of several Indian police officials in the Indian-administered Kashmir capital of Srinagar. Indian police and JEM extremists continued to engage in firefights throughout 2008 and 2009. In March 2011, Indian security forces killed chief JEM commander Sajad Afghani and his bodyguard in Srinagar, Kashmir.

In anticipation of asset seizures by the Pakistani government, JEM withdrew funds from bank accounts and invested in legal businesses, such as commodity trading, real estate, and production of consumer goods. In addition, JEM collects funds through donation requests in magazines and pamphlets, sometimes using charitable causes to solicit donations.

Harakat-ul Jihad Islami (HUJI) - Pakistan/Kashmir

Harakat-ul Jihad Islami was designated as a US Foreign Terrorist Organisation on 6 August 2010, Harakat-ul Jihad Islami (HUJI) was founded in 1980 in Afghanistan to fight against the Soviet Union. Following the Soviet withdrawal from Afghanistan in 1989, the organisation re-focused its efforts on India.

HUJI seeks the annexation of Indian Kashmir and expulsion of Coalition Forces from Afghanistan. It also has supplied fighters for the Taliban in Afghanistan. In addition, some factions of HUJI espouse a more global agenda and conduct attacks in Pakistan against US targets as well. HUJI is composed of militant Pakistanis and veterans of the Soviet-Afghan war. HUJI has experienced a number of internal splits and a portion of the group aligned with Al-Qaeda in recent years, including training its members in AQ training camps. Mohammad Ilyas Kashmi, one of HUJI's top leaders who also served as an AQ military commander and strategist, was killed on 3 June 2011.

HUJI has been involved in a number of terrorist attacks in recent years. On 2 March 2006, a HUJI leader was the mastermind behind the suicide bombing of the US Consulate in Karachi, Pakistan, which killed four people, including US diplomat David Foy, and injured 48 others. HUJI was also responsible for terrorist attacks in India including the May 2007 Hyderabad mosque attack, which killed 16 and injured 40, and the March 2007 Varanasi attack, which killed 25 and injured 100. HUJI claimed credit for the September 7, 2011 bombing of the New Delhi High Court, which left at least 11 dead and an estimated 76 wounded. HUJI sent an e-mail to the press stating that the bomb was intended to force India to repeal a death sentence of a HUJI member.

Harakat ul-Mujahideen (HUM) - Pakistan/Kashmir

Harakat ul-Mujahideen was designated as a US Foreign Terrorist Organisation on 8 October 1997, Harakat ul-Mujahideen (HUM) seeks the annexation of Indian Kashmir and the expulsion of Coalition Forces in Afghanistan. Reportedly under pressure from the Government of Pakistan, HUM's long-time leader Fazlur Rehman Khalil stepped down and was replaced by Dr. Badr Munir as the head of HUM in January 2005.

Khalil has been linked to Al-Qaeda and bin Laden, and his signature was found on bin Laden's February 1998 fatwa calling for attacks on US and Western interests. HUM operated terrorist training camps in eastern Afghanistan until Coalition air strikes destroyed them in 2001. Khalil was detained by Pakistani authorities in mid-2004 and subsequently released in late December of the same year. In 2003, HUM began using the name Jamiat ul-Ansar (JUA). Pakistan banned JUA in November 2003. HUM has conducted a number of operations against Indian troops and civilian targets in Kashmir. It is linked to the Kashmiri militant group al-Faran, which kidnapped five Western tourists in Kashmir in July 1995. The five reportedly were killed later that year.

HUM was responsible for the hijacking of an Indian airliner in December 1999 that resulted in the release of Masood Azhar, an important leader in Jamiat ul-Ansar, who was imprisoned by India in 1994 and founded Jaish-e-Mohammed (JEM) after his release. Another for-

mer member of Harakat ul-Ansar, Ahmed Omar Sheik was also released by India as a result of the hijackings and was later convicted of the abduction and murder in 2002 of US journalist Daniel Pearl. HUM targets Indian security and civilian targets in Kashmir. In 2005, such attacks resulted in the deaths of 15 people. In November 2007, two Indian soldiers were killed in Kashmir while engaged in a firefight with a group of HUM militants. Indian police and army forces have engaged with HUM militants in the Kashmir region, killing a number of the organisation's leadership in April, October, and December 2008. In February 2009, Kishen Advani, leader of the Indian opposition Bharatiya Janata Party, received a death threat that was attributed to HUM.

HUM collects donations from wealthy and grassroots donors in Pakistan, Saudi Arabia, and other Gulf states. HUM's financial collection methods include soliciting donations in magazine ads and pamphlets.

Al-Umar Mujahideen (AuM) - Kashmir

Al Umar Mujahideen was formed in 1989 to liberate the Indian State of Jammu and Kashmir through an armed struggle and merge it with Pakistan. The group has had the support of Pakistan's Inter-Services Intelligence Agency since the 1980s, during the early years of terrorist violence in Jammu and Kashmir, when the ISI perceived the AuM as a key group. The group is thought to have around 700 members. The group has been involved in numerous attacks including a grenade attack on the office of the separatist Democratic Freedom Party (DFP) in Srinagar in 2002.

Dukhtaran-e-Millat - Kashmir

Dukhtaran-e-Millat (Daughters of the Nation or DeM) is a radical Islamist women's group formed in 1987 and known for its vigilante efforts to impose strict Islamic practice in Indian-administered Kashmir, as well as its aid to other Kashmiri separatist groups. DeM was created in 1987 by Asiya Andrabi, a firebrand leader described as both a radical Islamist and feminist. Initially the group was formed to help Kashmiri women gain rights conferred to them by Islam, but the group quickly morphed into a militant organisation. Leaving behind their original concerns for women's rights, the group is now a religious-separatist movement that believes Kashmir should be part of Pakistan, and that violent jihad is necessary to bring about change in the region and the Islamic world as a whole.

The group made headlines in 1992 after attacking several Kashmiri women who defied a DeM communiqué ordering all women to wear the burqa (women's clothing that covers the whole body from head to toe, including the eyes, which are hidden behind a mesh veil).

In 1993, Andrabi was arrested with her husband, a member of the Hizb-ul-Mujahideen (HuM) militant group. Charged with "anti-national" activities, Andrabi

spent a year in jail, reportedly with her infant son.

The group has been responsible for numerous acts of violence against any act or business they deem immoral. The group has beaten women for sitting with men, destroyed liquor stores, and raided brothels. In response to this violence, Andrabi was again arrested, but was later freed. In addition to serving as a "morality police," the group is still thought to be aiding and abetting militant groups in the region, thus pursuing the twin goals of Islamic puritanism and Kashmiri separatism.

DeM is widely suspected of gun-running, money laundering, providing shelter, and serving as couriers and spies for several Kashmiri outfits including HuM and Jamiat ul-Mujahideen (JuM).

Hizb ul-Mujahideen (HuM) - Kashmir

Hizb ul-Mujahideen (HM) is the largest Kashmiri militant group, and officially supports the liberation of Kashmir and its accession to Pakistan, although some members are pro-independence. The group is the militant wing of Pakistan's largest Islamic political party, the Jamaat-i-Islami. It primarily targets Indian security forces and politicians in Kashmir and has conducted operations jointly with other Kashmiri militants.

It reportedly operated in Afghanistan through the mid-1990s and trained alongside the Afghan Hizb-I-Islami Gulbuddin in Afghanistan until the Taliban takeover. The group is made up primarily of ethnic Kashmiris but with some foreign sources.

While Indian intelligence reports that it is responsible for only about 10 to 20% of all terrorist strikes, Pakistani reports estimate that it controls about 60% of terrorists operating in Kashmir. The group was originally called Al Badr but was quickly renamed Hizb-ul Mujahideen.

Balochistan Liberation Army - Balochistan

The Balochistan Liberation Army is a separatist militant group based in a mountainous region of Western Pakistan, thought to be 500 strong, has conducted a series of attacks targeting security personnel, civilians and journalists. Nawabzada Hyrbyair Marri (born 1968) the fifth son of Baloch nationalist leader Khair Bakhsh Marri, is the current leader of the group. Baloch tribe is a famed warrior tribe, fiercely protective of their customs and culture, and have been involved in a conflict with the Pakistan authorities since the 1970s.

India

India is the seventh-largest country by area, the second-most populous country with over 1.2 billion people, and the most populous democracy in the world. Bounded by the Indian Ocean on the south, the Arabian Sea on the south-west, and the Bay of Bengal on the south-east, it shares land borders with Pakistan to the west; China, Nepal, and Bhutan to the north-east; and Burma and Bangladesh to the east.

India is derived from Indus, which originates from the Old Persian word Hindu. The latter term stems from the Sanskrit word Sindhu, which was the historical local name for the Indus River. India is home to the ancient Indus Valley Civilisation and a region of historic trade routes and vast empires. The Indian subcontinent was identified with its commercial and cultural wealth for much of its long history. Four world religions - Hinduism, Buddhism, Jainism, and Sikhism - originated here. Starting in the early 18th century, India was gradually annexed by and brought under the administration of the British East India Company and administered directly by the United Kingdom from the mid-19th century. India became an independent nation in 1947 after a struggle for independence that was marked by non-violent resistance led by Mahatma Gandhi.

The partition of India was set forth in the Indian Independence Act 1947 and resulted in the dissolution of the British Indian Empire and the end of the British Raj. British India was largely divided on the basis of religious demographics. This led to the creation of the sovereign states of the Dominion of Pakistan (that later split into the Islamic Republic of Pakistan and the People's Republic of Bangladesh) and the Union of India (later Republic of India). The violent nature of the partition created an atmosphere of mutual hostility and suspicion between India and Pakistan that plagues their relationship to this day. For more details see the Kashmir and Jammu Conflict above in Pakistan.

India has officially stated that it believes that Kashmir is an integral part of India, though the Prime Minister of India, Manmohan Singh, stated after the 2010 Kashmir Unrest that his government is willing to grant autonomy within the purview of Indian constitution to Kashmir if there is consensus on this issue. Pakistan maintains that Kashmir is the "jugular vein of Pakistan" and a currently disputed territory whose final status must be determined by the people of Kashmir. Certain Kashmiri independence groups believe that Kashmir should be independent of both India and Pakistan.

India's rapidly growing economy has of course a formal but also an extensive informal economy and remittance system which with persistent corruption and strict currency controls contributing to its vulnerability to economic crimes, including fraud, cybercrime, identity theft, money laundering and terrorist financing. India's porous borders and location between heroin-producing countries in the Golden Triangle of Southeast Asia and Golden Crescent of Central Asia make it a frequent transit point for drug trafficking. Proceeds from Indian-based heroin traffickers is widely known to re-enter the country via bank accounts, the hawala system, and money transfer companies. High-level corruption both generates and conceals criminal proceeds. Illicit funds are often laundered through real estate, educational programmes, charities, and election campaigns. The most common money laundering methods include: opening multiple bank accounts, intermingling criminal proceeds with assets of legal origin, purchasing bank cheques with cash, and routing funds through complex legal structures. Transnational criminal organisations use offshore corporations and trade-based money laundering to disguise the criminal origin of funds. Companies use trade-based money laundering to evade capital controls. Tax avoidance and the proceeds of economic crimes are significant vulnerabilities but laundered funds are also derived from narcotics trafficking, trafficking in persons and illegal trade. Counterfeit Indian currency is also a significant problem. Criminal networks exchange high-quality counterfeit currency for genuine notes.

India remains a target of terrorist groups, both foreign and domestic. Several indigenous terrorist organisations coexist in various parts of the country; some are linked to external terrorist groups with global ambitions. Terrorist groups often use hawalas and currency smuggling to move funds from external sources to finance their activities in India. Indian authorities report they have seized drugs sold by India-based extremist elements to production and/or trafficking groups in neighboring countries.

Indian list of Designated Terrorist Organisations

India has listed the following as terrorist Organisations: Akhil Bharat Nepali Ekta Samaj (ABNES); Al Badr; Tri-pura Tiger Force; Al-Qaeda; Babbar Khalsa; Communist Party of India (Marxist-Leninist); Deendayal Anjuman; Dukhtaran-e-Millat (DEM); Harkat-ul-Mujahideen / Harkat-ul-Ansar / Harkat-ul-Jehad-e-Islami; Hizb-ul-Mujahideen / Hizb-ul-Mujahideen; Indian Mujahideen; International Sikh Youth Federation; Jaish-e-Mohammad; Tahrrik-e-Furqan; Jamiat-ul-Mujahideen; Jammu and Kashmir Islamic Front; Kanglei Yawol Kannu Lup (KYKL); Kangleipak Communist Party (KCP); Khalistan Zindabad Force aka Khalistan Commando Force; Lashkar-e-Taiba; Manipur People's Liberation Front (MLPF); Maoist Communist Centre (MCC); National Democratic Front of Bodoland (NDFB); National Liberation Front of Tripura; People's Revolutionary Party of Kangleipak (PREPAK); Tamil Nadu Liberation Army (TNLA); Tamil National Retrieval Troops (TNRT);

Liberation Tigers of Tamil Eelam (LTTE); United Liberation Front of Assam (ULFA); United National Liberation Front (UNLF); Students Islamic Movement of India (SIMI); and the Garo National Liberation Army (GNLA).

Indian Gangs

In India, organised crime is at its worst in the city of Mumbai. The first well-known organised gang to emerge was that of Varadharaj Mudaliar in the early sixties. His illegal activities included illicit liquor, gold smuggling, gambling, extortion and contract murders. Three other gangs emerged shortly thereafter namely, Haji Mastan, Yusuf Patel and Karim Lala. Haji Mastan and Yusuf Patel dealt in gold smuggling whereas Karim Lala operated in drugs. During the State of Emergency in 1975, a crackdown on the Mafia occurred and new gangs emerged, with Dawood Ibrahim, head of D-Company, the most successful among gangs came in conflict with the Pathan gangs led by dons Alamzeb and Amirzada Pathan. The Pathan gangs were ultimately destroyed to leave the field free for Dawood Ibrahim and D-Company. Other prominent members of D-Company include Chhota Shakeel, Tiger Memon and Abu Salem, who is now in the custody of Indian police after long drawn extradition negotiations. The other gangs of Mumbai operating in organised crime are those of Chhota Rajan (Drug Trafficking and Contract Killings), Arun Gawli (Contract Killings and Protection Money), Late Amar Naik (Protection Money) and Chhota Shakeel. Other forms of organised crime in India are kidnappings for ransom, gun running, illicit trafficking in women and children, money laundering. Organised crime exists in other cities as well, though not to the same extent as in Mumbai. Ahmedabad city is home to liquor smuggling because of prohibition policy (banning of liquor). There are several gangs operating in Delhi from the neighbouring State of Uttar Pradesh indulging in kidnapping for ransom. It is also reported that in recent years the ganglords of Mumbai have started using Delhi as a place for hiding and transit. Chhota Rajan group is strengthening its base in Delhi. The boom in construction activities in Bangalore city has also provided opportunity for organised crime. Builders are used for laundering money. The forcible vacation of old disputed buildings is a tactic used by Indian gangs and serves as a linkage between organised crime and construction trade. Recently, a prominent ex-official of the municipal body in charge of Mumbai, declared that he had identified 400 structures in Mumbai belonging to D-Company. There are also allegations of the movie industry being financed by organised crime lords and allegations that popular film stars performed at gang functions or at the behest of D-Company surface from time-to-time..

D-Company - Pakistan / India

D-Company is closely linked to a range of organised criminal and terrorist activities in South Asia, especially in Mumbai, India, and the Persian Gulf region and is led by Dawood Ibrahim. Several members of the

gang are on the "wanted list" of Interpol and Indian police. The organisation has a history of rivalry with the Mumbai police and other underworld dons such as Chhota Rajan, Ejaz Lakdawala who was arrested in Canada in 2004 and Arun Gawli. Ibrahim is said to have begun his career in Mumbai working for the Karim Lala gang exploiting the rapid expansion in the Bombay (now Mumbai) textiles industry to his advantage. He soon moved his residence to Dubai in the United Arab Emirates where he has business interests alongside India. Indian defence intelligence agencies believe that Ibrahim and his associates run a major criminal underworld operation and have huge stakes in the ship demolition industry in India and are using these operations for smuggling in arms, explosives and contraband into the country. Ibrahim is also believed to control much of the 'hawala' system in India. Ibrahim is widely believed to have organised and financed the March 1993 Bombay Bombings leading India to declare him "India's most wanted man". According to the US authorities, Ibrahim maintained close links with Al-Qaeda's bin Laden. In 2003 the US Department of Treasury designated Ibrahim as a terrorist. The US further pursued the matter before the UN in an attempt to freeze his assets around the world and crack down on his operations. In 2011, Indian intelligence agencies also linked D-Company with the 2G spectrum scandal. Ibrahim is thought to reside in Pakistan, receiving protection from the Pakistani Intelligence Services.

Students Islamic Movement of India

The Students Islamic Movement of India (SIMI), proscribed under the Unlawful Activities (Prevention) Act, 1967, is an Islamist fundamentalist organisation with a proclaimed agenda to convert non-followers to Islam by force and convert India into Dar-ul-Islam (land of Islam). The SIMI was formed at Aligarh in the State of Uttar Pradesh on April 25, 1977. Mohammad Ahmadullah Siddiqi, Professor of Journalism and Public Relations at the Western Illinois University Macomb, Illinois, was the founding President of the outfit. It originally emerged as a student wing of the Jamaat-e-Islami Hind (JIH). The alliance broke over ideological differences related to Palestine Liberation Organisation (PLO) leader Yasser Arafat's visit to India. JIH thereafter floated a new student wing, the Students Islamic Organisation (SIO). SIMI runs an active agenda of fundamentalist Islam, opposition of the secular and democratic values on which the nation state of India is founded and adoption of violence as means of achieving their goals. The group believes in Islamic indoctrination of youth and children through Madarassas, strong presence in Islamic universities and other centres of religious education and youth front organisations such as Shaheen Force, the outfit's wing for schoolchildren. It supports secession of Jammu and Kashmir and is believed to have close links with Inter-Services Intelligence of Pakistan. SIMI has aligned itself with bin Laden whom they regard as a 'true believer of Islam' and are opposed to western culture and thought. The group also allegedly has links with almost every terrorist outfit with Islamic

leanings, a secessionist ideology and connections to Pakistan. The Indian police alleges that SIMI has transformed into the very violent and active terrorist group, Indian Mujahideen (IM), though some analysts believe that IM is a militant branch of SIMI while others believe that the two groups are distinct although linked. IM has claimed responsibility for a number of serial bomb blasts in crowded bazaars and commercial areas in Jaipur, Mumbai, Pune and other cities.

Indian Mujahideen (IM) - India

The Indian Mujahideen was designated as a US Foreign Terrorist Organisation on 19 September 2011. An India-based terrorist group with significant links to Pakistan, IM has been responsible for dozens of bomb attacks throughout India since 2005, and has caused the deaths of hundreds of innocent civilians. IM maintains close ties to other US-designated terrorist entities including Pakistan-based Lashkar e-Tayyiba (LeT), Jaish-e-Mohammed (JEM), and Harakat ul-Jihad-i-Islami (HUJI). IM's stated goal is to carry out terrorist actions against non-Muslims in furtherance of its ultimate objective, an Islamic Caliphate across South Asia. IM's primary method of attack is multiple co-ordinated bombings in crowded areas against economic and civilian targets to maximise terror and casualties. In 2008, an IM attack in Delhi killed 30 people; that same year, IM was responsible for 16 synchronised bomb blasts in crowded urban centres and a local hospital in Ahmedabad that killed 38 and injured more than 100. IM also played a facilitative role in the 2008 Mumbai attack carried out by LeT that killed 163 people, including six Americans. In 2010, IM carried out the bombing of a popular German bakery in Pune, India, frequented by tourists, killing 17 and injuring over 60 people. In 2011, IM conducted multiple bombings killing dozens of innocent civilians and injuring hundreds more. On 25 May IM was suspected of an improvised explosive device (IED) attack in New Delhi. On 13 July, 25 civilians were killed and 137 wounded in an IED attack in Mumbai. On 7 September, 15 civilians were killed, and 91 others injured in a bombing in New Delhi.

Sikh Terrorism - India

Sikh terrorism is sponsored by expatriate and Indian Sikh groups who want to carve out an independent Sikh state called Khalistan (Land of the Pure) from Indian territory. Active groups include Babbar Khalsa, Azad Khalistan Babbar Khalsa Force, Khalistan Liberation Front, Khalistan Zindabad Force and Khalistan Commando Force. Many of these groups operate under umbrella organisations, the most significant of which is the Second Panthic Committee. Sikh attacks in India are mounted against Indian officials and facilities, other Sikhs, and Hindus; they include assassinations, bombings, and kidnappings. These attacks have dropped markedly since 1992, as Indian security forces have killed or captured a host of senior Sikh militant leaders. Total civilian deaths in Punjab have declined more than 95% since more than 3,300 civilians died in 1991. The drop results largely from Indian Army, paramilitary, and

police successes against extremist groups. Sikh militant cells are active internationally and extremists gather funds from overseas Sikh communities. Sikh expatriates have formed a variety of international organisations that lobby for the Sikh cause overseas International Sikh Federation.

Babbar Khalsa International - India

Babbar Khalsa (BKI) is a Khalistani militant armed organisation based in India, it is considered a terrorist organisation by the Indian, US, Canadian and UK Governments. Despite setbacks incurred in the early 1990s following government action, BKI is still active.

Deendar Anjuman - South West India

Deendar Anjuman (DA) ("The Religious Association") is a Sufi Islamic sect formed in 1924 in the South West Indian State of Karnataka, whose capital and largest city is Bangalore, who came into prominence in the aftermath of 13 bomb explosions at various places of worship across the states of Andhra Pradesh, Goa and Karnataka in 2000. The group was proscribed in India in 2000. The DA perceives Islam as the only true global religion and regards Prophet Mohammed as the final prophet and uniquely, the sect interprets Islam as the logical conclusion of the spiritual beliefs of all 'true Hindus' and it also aims to convert India into an Islamic state. The group is alleged to be close to the Pakistani Inter Services Intelligence (ISI) and other Islamic fundamentalist groups in Pakistan and Saudi Arabia. Currently, it is reported to have established 150 branches comprising approximately 15,000 followers in India.

North Eastern India

India's North Eastern "Seven Sisters" region, an area made up of seven small northeastern states, has seen the emergence of several separatist armed groups seeking secession from the Federal Union of India. The different ethnic and cultural heritage of these states, late colonisation and unification with the rest of India in 19th century and their relative geographical isolation from the rest of India, has provided the separatist groups with a popular cause to canvass. These groups, with overlapping objectives and agreement over use of violence for achieving them, yet have significant differences in terms of ideology and leadership. The troubled border with China and porous borders with Bangladesh and Myanmar together with these countries' apparent policy of destabilizing the region, has provided fertile grounds for the growth of secessionist groups.

Most of these groups also have linkages with another hostile neighbour of India, Pakistan. The activities of most of these groups are localized in relatively small geographical areas and funded through criminal and unlawful activities. Many of these groups have targeted civilians besides the armed forces and police authorities and attack perceived outsiders, i.e. people from rest of India, living in the north eastern region. The Indian

Government has striven to meet the political aspirations of the diverse ethnic groups inhabiting the beautiful hills of Eastern Himalayas and valleys of Brahmaputra by carving out additional states and giving statehood to erstwhile union territories which has prompted a number of self-styled revolutionaries to join mainstream politics and governance. The terrorist outfits of North Eastern India are fairly unstable and frequently have in-fighting resulting in the formation of splinter groups. This constant splitting and reformation also makes them relatively difficult to track. The larger of these groups are discussed below.

Kanglei Yawol Kanna Lup - Manipur

The Kanglei Yawol Kanna Lup (KYKL) is an ethnic Meitei group based in Manipur, India. It is not a secessionist group but aims at strengthening the ethnic identity of the Meitei people and uniting the 'seven sister' states in the north eastern India. Ironically, it is formed from the dissenting factions of UNLF, PREPAK and Kangleipak Communist Party (KCP) 1994 and has carried out campaigns against other terrorist outfits. The group is infamous for its violent vigilantism and decrees aimed at "rebuilding Manipuri society" by "cleansing" it of immoral activities. Its terror activities are aimed at teachers, journalists, and HIV-positive innocents besides allegedly corrupt politicians, drug dealers and prostitutes. The group has issued decrees banning Hindi films, women wearing pants, and newspapers using Hindi script. The group claims that its objective is to cleanse Manipur of unwanted elements and moral corruption. KYKL funds its activities primarily through extortion that it collects jointly with the Nagaland-based National Socialist Council of Nagaland-Isak Muivah (NSCN-IM).

People's Liberation Front (PLA) - Manipur

The People's Liberation Army (PLA) was founded by N. Bisheshwar Singh on 25 September 1978. It is a separatist armed revolutionary group fighting for an independent socialist state of Manipur. It is allegedly the first organisation from Manipur to have been trained by the China's People Liberation Army at Lhasa in the 1980s National Socialist Council of Nagaland (NSCN) at its headquarters in north Myanmar during the 1980s.

The PLA aims to organise a revolutionary front covering the entire Northeast and unite all ethnic groups, including the Meiteis, Nagas and Kukis, to liberate Manipur. PLA, though a Meiti outfit, claims itself to be a trans-tribal organisation seeking to lead the non-Meiteis as well. Since its founding, it has been waging guerrilla warfare against the Indian Armed Forces and has targeted the Indian Army, Paramilitary Forces and the State Police Force. The organisation has an estimated strength of some 3800 as on 2008. PLA activists are equipped with sophisticated arms. The group has also been reportedly involved in widespread extortion operations. PLA is also a member of the Manipur Peoples Liberation Front, an umbrella organisation of separatist organisations of Manipur namely UNLF and PREPAK.

It has a government-in-exile in Bangladesh where the PLA has set up a number of bases in the Sylhet district. Two camps in Myanmar and five camps in Bangladesh are currently known to exist.

Revolutionary People's Front of Manipur

The Revolutionary People's Front (RPF) is the political wing of the People's Liberation Army (PLA), a militant group active in the northeastern Indian state of Manipur. RPF is essentially a government-in-exile based in Bangladesh. The group is well-organised, and includes departments for finances, publicity, and social welfare. Together, the RPF and the PLA are fighting to free Manipur from Indian 'colonial occupation.' Manipur was annexed by India, illegally according to the RPF, on October 15, 1949 and is one of the seven northeastern states (the 'Seven Sisters'). The 'Seven Sisters' are characterized by armed insurrections, ethnic and tribal tensions, and poor economic conditions. Although the RPF is a predominantly ethnic Meitei tribal group, it seeks to unite all ethnic and tribal groups in Manipur in order to liberate the territory.

Peoples Revolutionary Party of Kangleipak - Manipur

The People's Revolutionary Party of Kangleipak (PREPAK) was formed under the leadership of R.K. Tulachandra on October 9, 1977. The stated aim of PREPAK is to establish an independent state of Manipur for the ethnic Meitei people by ousting those who are considered outsiders to the valley of Manipur. It is believed to be trained variously by the National Socialist Council of Nagaland-Isak Muivah (NSCN-IM), the Kachin Independent Army (KIA) of Myanmar and has links with Pakistan's ISI. Like PLA and United National Liberation Front (UNLF), it is believed to have camps in Bangladesh and operates primarily in Manipur with occasional forays in neighbouring areas of Tripura and Nagaland. The group is armed with sophisticated weapons and has a history of targeting non-ethnic Meitei civilians, whom they consider as "outsiders" to the state, in the Manipur region along with government security forces, through bombings and small arms assaults. It is believed to indulge in extortion for financing its activities. The group remains active, though with limited influence and confined to a limited geographical area.

United National Liberation Front - Manipur

The United National Liberation Front (UNLF), the oldest Meitei insurgent group in Manipur, was formed as a non-violent organisation under the leadership of Areambam Samrendra Singh on 24 November 1964, dedicated to creating an independent political state and a socialist society. In 1990, the group publicly announced that they will take the course of armed struggle to achieve their goal of an independent Manipur. The group formed the Manipur People's Army (MPA) as an armed wing, and since that time, the UNLF has launched numerous attacks against Indian Army and se-

curity personnel besides fighting with other secessionist groups in Manipur, including Kanglei Yawol Kanna Lup and the National Socialist Council of Nagaland-Isak Muivah. During the 1990s the UNLF also took vigilante action against alcoholism, drug abuse, gambling, and other crime to undermine the executive and judiciary framework. The group has training camps in Myanmar and Bangladesh and finances its terror activities primarily by extortion, gun-running, and smuggling. UNLF is part of the tri-partite alliance of the Manipur Peoples Liberation Front together with PLA and PREPAK. The group continues to attack Indian security forces and participates in sporadic violence against rival insurgent groups over both ideological and ethnic issues and is considered the most significant terror threat in North Eastern parts of India.

United Liberation Front of Assom - Assam

United Liberation Front of Assam (ULFA) was formed on April 7, 1979, to establish a "sovereign socialist Assam" through an armed struggle. While ULFA was formed in 1979, the group did not commence significant activities until 1986. ULFA reportedly established camps along the Indo-Bhutan border in early 1990s and developed links with officers of Royal Bhutan Army and has allegedly been trained by the Inter Services Intelligence of Pakistan and Directorate General of Field Intelligence of Bangladesh. Links to China and Myanmar have been suggested as have connections to the Liberation Tigers of Tamil Eelam (LTTE) and the Afghan Mujahideen. ULFA allegedly also joined hands with terrorist outfits across North Eastern India and in Myanmar, with the Chin National Front supplying them with arms from Thailand. Claims of several commercial activities undertaken in Bangladesh for laundering money as well as drug trafficking have been made against Pares Baruah, one of the founders of ULFA. In the early 1990s, ULFA launched an aggressive campaign of terror attacks including holding 14 people for ransom in July 1991, an unsuccessful assassination attempt on Chief Minister Prafulla Kumar Mahanta in 1997, assassination of local minister Nagen Sharma in 2000, explosion killing school children in August 15, 2004 and killing of 62 migrant workers in 2007 in a series of attacks. On 5 February 2011, ULFA split in two parts Anti-Talks faction of ULFA ("ULFA ATF") led by Pares Baruah and Abhijit Barman and Pro-Talks faction of ULFA ("ULFA PTF") led by Arabinda Rajkhowa. A tripartite agreement for Suspension of Operations was signed by the Government of India, the State Government of Assam and the ULFA PTF on 3 September 2011. The ULFA PTF has since continued to engage in talks with Government of India.

ULFA ATF, which has an estimated strength of 150-250 militants, continues to recruit and train cadre and news reports suggest that it has camps in Myanmar, Garo hills of Meghalaya and Tirap and Changlang Districts of Arunachal Pradesh and Mon District of Nagaland as well as three camps in Bangladesh. The ULFA ATF continues to maintain linkages with other militant for-

mations in North Eastern parts of India and Myanmar and continues to enjoy the support of the Inter Services Intelligence of Pakistan.

National Democratic Front of Bodoland - Bodoland

Bodo Security Force (BdSF), formed on 3 October 1986 under the leadership of Ranjan Daimary, was in 1993 the National Democratic Front of Bodoland (NDFB) on 25 November 1994. The separatist outfit, active in the north eastern region of India, in particular north and north-west of the river Brahmaputra in Assam and areas close to the Assam-Meghalaya border, has been waging an armed campaign for a "sovereign Boroland" and "self-determination for the Bodos. The outfit has bases allegedly in Bangladesh, Myanmar and Bhutan and was very active in the 1990s.

Several acts of terror have been attributed to NDFB including 12 December 1992 attack on the 7th Assam Police Battalion headquarters at Choraikhola in Kokrajhar district and the nine serial blasts triggered by the outfit in Guwahati, Kokrajhar, Bongaigaon and Barpeta Road which resulted in high civilian casualties. It was alleged that NDFB, along with the ULFA, on various occasions was found to be channelling its funds through the "Bhutanese diplomatic bag" to their leaders based in Southeast Asian capitals. In December 2003, the government of Bhutan and the Indian Army launched joint operations to destroy these terrorist camps operated in Bhutanese territory by ULFA and NDFB. After the operations, which significantly undermined the strength of the outfit, the NDFB, on 8 October 2004, announced a six-month long unilateral ceasefire with effect from 15 October. Subsequently, a tripartite agreement between the Government of India, State Government of Assam and NDFB was signed on 25 May 2005 in New Delhi which has been extended repeatedly. The activities of NDFB had fallen significantly since the ceasefire. However, the recent formation of a new state in South India has led to the group raising its demand with renewed vigour. The Government of India has indicated that they would be willing to initiate negotiations for a tripartite permanent peace accord. As a first step, Daimary, who was handed over to India by Bangladesh on 1 May 2010, was granted conditional bail on 24 June 2013 in all of the 13 cases pending against him.

National Liberation Front of Tripura - Tripura

The National Liberation Front of Tripura (NLFT) was formed on 12 March 1989, with Dhananjoy Reang (former Vice-President of the Tripura National Volunteers) as its 'Chairman'. The stated purpose of NLFT is to secede from India and establish an independent Tripura state, through an armed struggle. The NLFT manifesto says that they want to expand what they describe as the kingdom of God and Christ in Tripura. NLFT is constantly in flux and has given rise to several splinter groups. In 2001, NLFT split into two main factions, one led by Nayanbasi Jamatiya and the other by Biswamohan Debbarma. According to confiscated records of NLFT, the split was caused by internal bicker-

ing among senior leaders, misappropriation of funds by certain senior NLFT members, and disagreement over the forcible conversion of NLFT members to Christianity. According to at least one report, approximately 90% of senior NLFT members are Christians. Despite the internal fighting and regardless of future splintering of the NLFT, the group remains an active terrorist threat in the Tripura state of India. Indian Government officials have accused the Baptist Church of Tripura of supporting this violent campaign by providing funding and arms for the group. In April 2000, Nagmanlal Halam, secretary of the Noapara Baptist Church in Tripura, was caught providing 50 gelatin sticks, 5kgs of potassium and 2kgs of sulphur and other ingredients for making explosives to the group. The NLFT operates from camps based in Bangladesh and along the Indian-Bangladesh border. NLFT has further links with the Inter Services Intelligence Agency (ISI), Pakistan's external intelligence agency and its counterpart in Bangladesh, the Directorate General of Forces Intelligence (DGFI). During 1997-98, NLFT leaders are reported to have visited Pakistan to receive training and arms from the ISI. The NLFT is currently proscribed as a terrorist organisation in India.

Garo National Liberation Army - Garoland

The Garo National Liberation Army (GNLA) was formed in 2009 and is fighting for a 'sovereign Garoland' in North Eastern India in the Western areas of Meghalaya. Since its formation, from local police and security units, the GNLA has been involved in killing, abduction, extortion, bomb blasts and attacks on Indian Security Forces. The GNLA has forged close operational links with other North-East-based militant groups like the United Liberation Front of Assam (ULFA) and the NDFB. It also has links with the National Socialist Council of Nagaland-Isak-Muivah (NSCN-IM). The outfit has also forged an alliance with the Bangladesh-based militant group, A'chik Special Dragon Party, which operates along the India-Bangladesh border in the western part of Meghalaya. It is believed to have around 70 active members. The Government of India, which initially dismissed the GNLA as a "bunch of criminals", invited in 2010, the group for talks to "facilitate their surrender", without so far any success.

Hynniewtrep National Liberation Council (HNLC) - Meghalaya / Garoland

The Hynniewtrep National Liberation Council (HNLC) was formed in 1992 as a militant tribal outfit seeking to transform Meghalaya in India as a province exclusively for the Khasi tribe and free it from 'domination' by the Garo tribe and to fight against the presence of 'outsiders'. The HNLC was proscribed as a terrorist organisation by the Government of India in 2000. The top leadership of the group is based in the Bangladeshi capital Dhaka, with many HNLC camps also located in Bangladesh. The HNLC is closely linked with the National Socialist Council of Nagaland and the National Liberation Front of Tripura.

Achik National Volunteer Council (ANVC) - Garoland

The Achik National Volunteer Council (ANVC) was formed in 1995 to carve out a homeland called 'Achik Land' in the areas of Garo Hills. The proposed 'Achik Land' comprises the present districts of Garo Hills in Meghalaya and a large district of Assam, which is home to a 'Garo majority' in these areas. Whilst the group was proscribed in 2000, it signed a ceasefire agreement with the Government of India in 2004.

Tamil Nadu Liberation Army - Tamil Nadu

In the early 1980s, a number of separatist groups emerged in Tamil Nadu. These groups were active during the period when the Indian Peacekeeping Force (IPKF) was sent to Sri Lanka and pro-Liberation Tigers of Tamil Eelam (LTTE) sentiments were running high among a section of people in the State. The groups laid claim to a Greater Tamil Nadu independent of India and comprising not just the Indian state for Tamil Nadu and Karnataka but diverse regions such as Sri Lanka and the Maldives, based on shared Dravidian language and culture. These groups had linkages with the Liberation Tigers of Tamil Eelam, the armed rebel group in Sri Lanka which was recently defeated by the Sri Lankan army in a long and bitter civil war.

These groups were also linked to local criminals such as the notorious sandalwood smuggler, Veerappan who was killed in 2004 after years of being chased by the police force of three of the southern states of India. Tamil Nadu Liberation Army (TNLA), one such group, became active in Tamil Nadu in this period. Pulavar Kaliyaperumal, a former school teacher and a left-wing Naxalite extremist, initiated a debate on Tamil nationalism leading to a split in the all-India unit of the Communist Party of India-Marxist-Leninist (CPI-ML). The separatist faction formed Tamil Nadu Communist Party-Marxist-Leninist (TNCP-ML) in 1984-85 with the goal of achieving an independent Tamil home-land through armed struggle. The TNCP-ML's armed wing was named TNLA. Sundaram headed the TNCP-ML and Thamizharasan, an engineering student from Ponparappi village, headed the TNLA. TNLA engaged in bomb blasts, murders and even bank robbery.

India proscribed the TNLA, however, official sources have indicated that after the proscription, the TNLA operated under a new name. "Tamizhar Vidhuthalai Iyakkam".

Tamil National Retrieval Troops - Tamil Nadu

Another group with similar aims and connections is the Tamil National Retrieval Troops ("TNRT"). It is a small outfit and is believed to be functioning since the late eighties in the southern Indian State of Tamil Nadu, though its exact date of founding is not known. The TNRT was founded by Ravi alias P. Ravichandran. He was an accused in the 1990-murder, in Chennai, of Eelam People's Revolutionary Liberation Front (EPRLF)

general secretary Padmanabha and the 1991 assassination in Sripurambadur of former Indian Prime Minister Rajiv Gandhi. Ravi was sentenced to life in prison in 1999 in connection with the Rajiv Gandhi assassination case. Since Ravi's imprisonment, it is not known who has been providing leadership to TNRT cadres. It has been proscribed under the Prevention of Terrorism Act (POTA), 2002. Several other groups in Tamil Nadu, such as Thamizh Thesi Pothuvudai Katchi (TTPK), Tamil National Liberation Movement, propagate the idea of a separate and independent Tamil nation. However these claim to be believers of the democratic process and do not advocate violence.

Communist Party of India (CPI-Maoist)/The Maoist Communist Centre of India (MCC)

The MCC came into existence, in an earlier version in 1969, as Dakshin Desh, which refused to join in with the mergers at the time leading to the creation of the Communist Party of India (Marxist-Leninist). Dakshin Desh was renamed in 1975 as the Maoist Communist Centre. Like other left wing extremist groups, the purported objective of the MCC is to establish a 'people's government' through 'people's war'. It traces its ideology to the Chinese Communist leader Mao Zedong's teachings of organised peasant insurrection. The MCC was mostly active in areas of West Bengal with attempts also to operate in parts of Uttar Pradesh. In September 2004, the MCC merged with the People's War Group (another left-wing extremist group) to form the Communist Party of India-Maoist (CPI-Maoist), whereupon the MCC ceased to exist. The CPI-Maoist's current goal is to establish a "Compact Revolutionary Zone," an area of control that would extend from the Nepalese border to Andhra Pradesh in the south. Eventually this zone would be converted into an independent communist state. The Indian government is vehemently opposed to any territorial concessions to the group.

Bangladesh

The name Bangladesh means "Country of Bengal" and is an independent country, which together with the neighbouring Indian state of West Bengal, makes up the region of Bengal. The borders of modern Bangladesh took shape during the Partition of Bengal and British India in 1947, when the region became first East Pakistan, being the eastern wing of the newly formed state of Pakistan and later in 1971 to full independence as Bangladesh. Bangladesh is a parliamentary republic with a population of more than 160 million people, being one of the world's most densely populated countries. The Bengalis form the country's predominant ethnic group, with almost 90% following Islam. After a series of military coups and corrupt governments, the country returned to fully democratic rule only in December 2008 with the election of Prime Minister Sheikh Hasina as head of the Awami League and the party that fought for original independence.

Bangladesh's geographic location, including its seaports and long porous borders with India and Burma, make it a transhipment point for drugs produced in both the "golden triangle" of Southeast Asia and "golden crescent" of Central Asia. In addition to drug trafficking, corruption, fraud, counterfeit money, and trafficking in persons are the principle sources of illicit proceeds. Bangladesh is also vulnerable to terrorist financing, including funding that flows through the hawala/hundi system and by cash courier. The Bangladesh-based terrorist organisation's Jamaat ul-Mujahideen Bangladesh and Harakat ul-Jihad-i-Islami are looking to establish Islamic law and strict adherence in the country and are co-operating with Pakistani and Afghan groups with similar aims. Black market money exchanges remain popular because of the non-convertibility of the local currency and scrutiny of foreign currency transactions made through official channels. Alternative remittance systems are also used to avoid taxes and customs duties. Additional terrorism financing vulnerabilities exist, especially concerning the use of non-governmental organisations (NGOs), charities, counterfeiting, and loosely-regulated private banks.

Jamaat-ul-Mujahideen - Bangladesh

Jamaat-ul Mujahideen Bangladesh (JMB) is an Islamist organisation operating in Bangladesh. It was founded in 1998 in Palampur in Dhaka division by Abdur Rahman and gained public prominence in 2001 when bombs and documents detailing the activities of the organisation were discovered in Parbatipur in Dinajpur district.

The organisation was officially banned by the government of Bangladesh in February 2005. The stated aim of JMB is to advocate fundamentalist Islam, Islamic law and liberating Muslims of the influence of 'anti-Islam forces' and practices. They are proclaimed anti-west, US and Britain which they believe are occupying Muslim lands. They are opposed to popular arts such as music and cinema and view NGOs as creatures of western governments. They are also against women's emancipation and integration in the society. JMB aims at establishing the rule of Islam in Bangladesh through an armed struggle. Some reports suggest that it is the youth front of the Al Mujahideen, an organisation allegedly formed in the mid-1990s but whose existence is still ambiguous, whereas others indicate that the JMB is another name for the vigilante Islamist group the Jagrata Muslim Janata Bangladesh (JMJB). Maulana Saidur Rahman is known to be currently heading the JMB.

JMB has run a campaign of terror in North Bangladesh with terror attacks in public places. Following the ban by Bangladesh government, the group carried out a massive attack by detonating detonated 500 bombs at 300 locations throughout Bangladesh in August 2005 attacking in 63 of the 64 Districts in the country.

The JMB allegedly receives funding from individual donors in countries like Kuwait, the UAE, Bahrain, Pakistan, Saudi Arabia and Libya. Several international

NGOs such as the Kuwait-based Revival of Islamic Heritage and Doulatul Kuwait, UAE-based Al Fuzaira, Khairul Ansar Al Khairia, Bahrain-based Doulatul Bahrain and the Saudi Arabia-based Al Haramain Islamic Institute have also said to have provided funding to the outfit, though any links to terrorism have been denied. The JMB and its leaders are reported to have invested in a large number of shrimp farms and cold storages in the south-western region of Bangladesh. The outfit is also alleged to be involved in money laundering activities, collecting illegal taxes and extortion to fund its terror activities and channeling funds through illegal channels known as Hundi. The outfit remains an active threat in Bangladesh.

Harakat ul-Jihad-i-Islami - Bangladesh

Designated as a US Foreign Terrorist Organisation on 5 March 2008, Harakat ul-Jihad-i-Islami/Bangladesh (HUJI-B) was formed in April 1992 by a group of former Bangladeshi Afghan veterans to establish Islamic rule in Bangladesh.

In October 2005, Bangladeshi authorities banned the group, HUJI-B has connections to Pakistani militant groups such as Lashkar-e-Tayyiba (LeT) and the Indian Mujahideen (IM), which advocate similar objectives. The leaders of HUJI-B signed the February 1998 fatwa sponsored by Al-Qaeda and bin Laden that declared American civilians legitimate targets. In December 2008, three HUJI-B members were convicted for the May 2004 grenade attack that wounded the British High Commissioner in Sylhet, Bangladesh. In 2011 Bangladeshi authorities formally charged multiple suspects, including HUJI-B leader Mufri Abdul Hannan, with the killing of former Finance Minister Shah AMS Kibria of Awami League (AL) in a grenade attack on 27 January 2005. Bangladeshi police also arrested many top HUJI-B leaders in 2011, including Amir Rahmatullah (aka Sheikh Farid) in April, and chief Moulana Yahiya in August. Bangladeshi police recovered arms, explosives and bomb making materials following the arrest of HUJI-B operative Abdul Alim in May. HUJI-B leaders claim that up to 400 of its members are Afghan war veterans, but its total membership is unknown.

The group operates primarily in Bangladesh and India. HUJI-B trains and has network of madrassas in Bangladesh. HUJI-B funding comes from a variety of sources. Several international Islamic non-governmental organisations may have funneled money to HUJI-B and other Bangladeshi militant groups.

Nepal

Nepal as a population of approximately 27 million, is located in the Himalayas and bordered to the north by China, (the Tibetan autonomous region) and to the south, east, and west by India. The mountainous north of Nepal has eight of the world's ten tallest mountains,

including Mount Everest. It is also the birthplace of the Buddha, though Hinduism is practiced by about 80% of Nepalis.

In 1951, the Nepali monarch ended the century-old system of hereditary rule and instituted a cabinet system of government.

An insurgency led by Maoist extremists broke out in 1996. The ensuing 10-year civil war between the Communist Party of Nepal (Maoist) (now known as the Unified Communist Party of Nepal (Maoist)) and government forces culminated in a 2006 peace accord. The ensuing elections in 2008 overwhelmingly favored the abolition of the monarchy and the establishment of a federal multiparty representative democratic republic.

In recent developments, political parties of Nepal have agreed on forming an interim election government, (with coalition governments including the Unified Communist Party) under the leadership of Chief Justice Khil Raj Regmi who is charged with holding Constituent Assembly elections by December 2013.

Government corruption, poorly regulated trade, weak financial sector regulation, and a large informal economy make the country vulnerable to money laundering and terrorist finance. Although Nepal is neither a significant producer of, nor a major transit route for narcotic drugs, hashish, heroin, and domestically produced cannabis and opium are trafficked to and through Nepal every year, en route from South East Asia to the West.

Its relatively porous borders with India and China are used to conceal trafficking in drugs and human beings. The major sources of laundered proceeds stem from tax evasion, corruption, counterfeit currency, smuggling, and invoice manipulation.

The Communist Party of Nepal-Maoist - Nepal

The CPN-M's strategy and tactics are based on traditional Maoist guerrilla war principles. As part of its struggle against the current regime, the Maoists have targeted Nepalese parliamentarians, the Prime Minister, government ministries, and a number of educational institutions. International targets have occasionally been hit as well, largely in an effort to isolate the government.

Two US embassy guards were assassinated by the Maoists in 2002, allegedly for anti-Maoist spying activities. Further attacks against diplomatic targets have been threatened in CPN-M press releases. Foreign commercial groups are also targets for the Maoists, as they demonstrated in three attacks on Coca-Cola facilities and one attack on a Pepsi-Cola truck.

Despite a massive effort from the Royal Nepalese Army (at the behest of then King Gyanendra) to crackdown on the CPN-M, the group enjoys widespread support and is believed to control an estimated 70% of the Nepalese countryside. The CPN-M have an estimated strength of 10,000-20,000 armed members with an

arsenal that has increased in both size and sophistication in recent years. In addition to receiving funds and support from expatriate Nepalese living in India, the group funds its operations through extortion, "taxation" and bank robberies.

The group maintains bases in India as well as Nepal and enjoys support from many Indian insurgent groups, most notably the [United Liberation Front of Assam](#) and the [Communist Party of India-Maoist \(CPN-M\)](#).

In February 2005, ostensibly due to his inability to crush the rebels, King Gyanendra issued a state of emergency and dismissed parliament. Although this move was done purportedly to defeat the CPN-M, Gyanendra's power-grab seems to have only strengthened the rebel's position. Widespread opposition to the King's move amongst the Nepalese people has lent credence to the rebel movement and has served to improve ties between the CPN-M and other legitimate political parties.

In April 2006, facing massive protests, King Gyanendra gave up power and announced that parliament would re-assemble. In November 2006, CPN-M and the Nepalese political establishment reached a peace deal which would see the rebels disarming under UN supervision and joining the Nepalese parliament as the second largest party. The peace agreement has been hailed as "historic" and a "landmark" for ending violence in Nepal.¹⁸

Whilst the CPN-M was designated in 2003 by the US as a global terrorist entity, it was removed from the US list of designated global terrorist groups in 2011.

Akhil Bharat Nepali Ekta Samaj - Nepal

Akhil Bharat Nepali Ekta Samaj (ABNES) was formed to form unity and provide support among immigrant Nepalese residing in India. However, ABNES gradually became involved in terrorism and began to function as a front for the Maoist insurgents of Nepal. It is also believed that the organisation is working for the proliferation of a greater Nepal idea. ABNES has established an extensive network all over India. It has a strong base in northern Bengal and is active in Northeast India, Uttar Pradesh and Bihar, in areas inhabited by ethnic Nepalese, and in stretches bordering Nepal. ABNES have ties with left-wing extremists of the People's War Group (PWG) and [Maoist Communist Centre \(MCC\)](#), who have strong ties with the Maoist insurgents.

The PWG, MCC and the Maoist insurgents are members of a left-wing extremist coalition, Coordinating Committee of Maoist Parties and Organisations in South Asia (CCOMPOSA), which was founded in mid-2001. A youth organisation known as the Akhil Bharatiya Nepali Vidyarthi Sangh, is closely linked to the activities of ABNES. ABNES was proscribed in 2002.

Sri Lanka

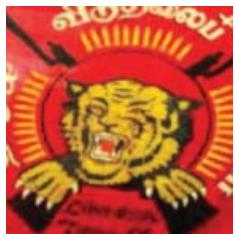

Sri Lanka, is an island country in the northern Indian Ocean off the southern coast of the Indian subcontinent in South Asia and known until 1972 as Ceylon. Sri Lanka is known as "the Pearl of the Indian Ocean" because of its natural beauty. Sri Lanka has also been called "the teardrop of India" because of its shape and location, and "the nation of smiling people". The island contains tropical forests and diverse landscapes with high biodiversity. Sri Lanka is a diverse country, home to many religions, ethnicities and languages. It is the land of the Sinhalese, Sri Lankan Tamils, Moors, Indian Tamils, Burghers, Malays, Kaffirs and the aboriginal Vedda.

The first Sinhalese arrived in Sri Lanka late in the 6th century B.C., from northern India. And in the 14th century, a south Indian dynasty established a Tamil kingdom in northern Sri Lanka. The island came under British rule by 1815, becoming known as Ceylon, later achieving independence in 1948 and changing its name to Sri Lanka in 1972. The country's recent history has been marred by a thirty-year civil war between the government forces representing the Sinhalese majority and the [Tamil Tigers \(LTTE\)](#) representing the Tamil minority in the North of the Island, which decisively but controversially ended in a military victory in 2009 by the government.

President Rajapaksa attained the Presidency in 2005 and was re-elected in 2010 to a second term. Allegations of war crimes have surfaced by WikiLeaks who made public secret US cables from 2009–10, stating that American diplomats believed that President Rajapaksa was responsible for the massacres of Tamil civilians and captured LTTE fighters at the end of the war with the LTTE. The cable also states the responsibility for many of the alleged crimes rests with the country's senior civilian and military leadership, including President Rajapaksa, his brothers and Former Army Chief General Fonseka. In April 2011, Ban Ki-moon published a report by a UN-appointed panel of experts, which concluded that as many as 40,000 people were killed in the final weeks of the war between the [Tamil Tigers](#) and government forces. For their part, Rajapaksa and his government have denied all allegations of war crimes. Sri Lanka is not an important regional financial center nor a preferred center for money laundering. However, there is corruption in government, experience with terrorism, tax evasion, and a large informal economy make the country vulnerable to money laundering and terrorist finance. Sri Lanka is primarily a source country for men, women, and children subjected to forced labour and sex trafficking, including in Saudi Arabia, Kuwait, Qatar, the United Arab Emirates, Jordan, Bahrain, Lebanon, Iraq, Afghanistan, Malaysia, and Singapore including work as domestic servants, construction workers, or garment factory workers face conditions indicative of forced labour.

Special Focus 10

Liberation Tigers of Tamil Eelam (LTTE) - Sri Lanka

The Liberation Tigers of Tamil Eelam ("LTTE") were founded in May 1976 by Vellupillai Prabhakaran with the objective of creating a separate state for Tamils in northern and eastern Sri Lanka.

Ethnic tensions within Sri Lanka, which possesses a majority Sinhalese and a minority Tamil ethnic population, have a long history but emerged most vehemently following the country's independence from British rule in 1948. It was at this point that it became evident that the minority Tamil group (which constitutes the majority population in Sri Lanka's northern and eastern provinces) would be politically marginalized by a system of proportional representation as a result of the greater size of the Sinhalese population nationwide. Such marginalization of the Tamil people, the majority of whom follow the Hindu faith, was emphasized and institutionalized in the 1972 Sri Lanka Constitution, which decreed that the "Republic of Sri Lanka shall give to Buddhism the foremost place" and "it shall be the duty of the State to protect and foster Buddhism".¹⁹

Prabhakaran pursued five principles, which to him justified the LTTE's armed struggle: Recognition of the Tamil as a nation; Recognition of the existence of an identified homeland for the Tamil people; Recognition of the right to self-determination for the Tamil people; Recognition of the right of the Tamil people to separate citizenship; and Recognition of the fundamental right of all Tamils to look on the north and eastern provinces of Sri Lanka as their country. These demands became known as the Thimpu Principles and were presented by the Tamil delegation at the first peace talks of the Sri Lankan Civil War. Prabhakaran also introduced a highly selective recruitment policy favouring Tamils and increased the professionalism of the LTTE's organisation.

Between 1983 and 2009 the conflict between the LTTE and the Sri Lankan government escalated into a civil war. During the period 1983 to 1987 the Indian government, provided arms, training and monetary support to six Sri Lankan Tamil militant groups including the LTTE. During this time the LTTE was just one of several Tamil militant groups operating in Sri Lanka but increasingly established its dominance in the Tamil community as a result of its excellent organisation and

reputation for ruthlessness. In 1987, following direct Indian intervention to broker a peace accord and introduce the Indian Peacekeeping Force (IPKF), the LTTE refused to lay down their weapons and declared war on the IPKF, allegedly ending Indian government funding for the LTTE cause.

The LTTE has since been classified as a terrorist organisation in 32 countries, including India, the US, the UK and the EU and whilst it is now defeated it was at its height regarded for example by the FBI as one of the most dangerous terrorist organisations in the world.

To the present day the LTTE is attributed 12 high level assassinations, including Sri Lankan President Ranasinghe Premadasa and former Indian Prime Minister Rajiv Gandhi, in addition to more than 200 other suicide attacks, and the waging of a 26 year military campaign against the Sri Lankan government that claimed in excess of 70,000 lives. The sophistication of the organisation is aptly demonstrated by its possession of a naval wing known as the Sea Tigers, as well as an air division that in 2007 carried out aerial attacks on Sri Lankan military bases.

In 2009, with the death of leader Velupillai Prabhakaran, the LTTE admitted defeat.²⁰ The group pledged to lay down its arms and the peace has remained unbroken. However, that is not to say that ethnic tensions have evaporated, rather assimilation of Tamils back into Sri Lankan society has been piecemeal and accusations of human rights abuses have been levelled at the Sri Lankan government.

The LTTE financed its operations from a range of sources that included the voluntary and forced contributions of its diaspora community, charities, legitimate businesses and criminal activities. There is some evidence to suggest that LTTE established commercial links with other terrorist organisations. For example, there is evidence which indicates the LTTE provided forged passports to Ramzi Yousef (the man who carried out the first attack against the World Trade Centre in New York in 1993) and that the LTTE stole Norwegian passports and sold them to Al-Qaeda in order to generate funds with which to purchase arms. Some have argued that many of the techniques used by Al-Qaeda have been copied from the LTTE. At its height the LTTE Tamil Tigers was able to raise hundreds of millions of dollars a year, with an estimated 80% of this coming from Tamils in the UK, Canada, Switzerland and Scandinavia. Of the estimated 300,000 Tamils based in the UK, it has been estimated that 20,000 to 30,000 are sympathizers of the LTTE and have been actively engaged in fund raising activities. The Tamil community in the UK is predominantly concentrated in London in places such as Tooting, Mitcham and Harrow. In these communities donating funds to the LTTE has been made easy through the use of the "undiyal" money transfer system. The UK Centre for Social Cohesion has estimated that the LTTE was able to raise £250,000 in donated funds every month from

the UK. There has also been widespread LTTE extortion in the Tamil diaspora based on threats to relatives in Sri Lanka and to prospective donors themselves. Human Rights Watch has presented evidence of LTTE extortion from the Tamil community in Britain based on threats to family members living in Sri Lanka and on more direct personal threats to Tamils living in Britain. It claims that a number of British Tamil associations operate in part as front organisations.

Temples and charities are believed to provide a hub for the co-ordination of financial support for the LTTE. This makes the task of distinguishing donations for legitimate and humanitarian causes from terrorism financing extremely difficult. For example, in 2008 the Sivayogam Trust which ran the Muthuthumaari Amman temple in Tooting (which acts as a focal point for a large population of Tamils who originate from Valvettithurai where Vellupillai Prabhakaran was born and which runs five orphanages in Sri Lanka) had funds frozen by the UK Charities Commission because it suspected that the funds were being sent to the LTTE. In May 2009 the UK's Independent newspaper published an article in which one of the trustees of the charitable wing of the Muthuthumaari Amman temple was quoted as saying "ninety percent of Tamils support the LTTE ideologically but that does not mean they give money to them". When asked whether the temple was still receiving donations for their work abroad, the same trustee reportedly said that "we advise devotees to send [charitable donations] directly instead".

This highlights the fact that there is genuine support for the ideological aims of the LTTE and the ease with which this ideological affinity can be used to legitimise sending funds to the LTTE. It also highlights the risk of donations to the LTTE being pushed out of mainstream channels as a result of official scrutiny and the perceived risk of asset freezing. Funds donated in good faith for humanitarian purposes have historically been susceptible to being diverted for illegitimate ends and the LTTE has sought to capitalise on world events to maximise their revenue generating capabilities. For example, in May 2007, two Tamils with connections to the LTTE were arrested in Australia for raising thousands of dollars under the pretence of being for charities and aid for those affected by the 2004 tsunami which killed 35,000 people in Sri Lanka. In Canada, the World Tamil Movement was designated as a terrorist organisation and the charitable status of the Tamil Refugee Aid Society of Ottawa and the Canadian Foundation for Tamil Refugee Rehabilitation were revoked in 2010 and 2011 respectively.

The LTTE has also engaged in drug smuggling, human trafficking, sea piracy and hijacking, arms smuggling, money laundering, passport forgery and credit card fraud to obtain money to fund the war against the Sri Lankan government. Drug smuggling has been a long standing part of the LTTE's fund raising efforts, netting the organisation US\$200mio a year.

The LTTE had trafficking groups in Thailand, Spain, Switzerland, Italy and France and has been primarily involved in trafficking heroin from Burma and Afghanistan. The Canadian authorities have claimed that the LTTE controls part of the USS1bio drug trade in Montreal and Indian authorities have also claimed LTTE involvement in drug distribution in India. More than 4,000 Tamils have been jailed throughout the world for trafficking narcotics.

World Tamil Movement Canada - Sri Lanka

In 2008, 2 years after it was established in Canada, the World Tamil Movement, which raised funds for the Tamil Tigers from the Canadian tamil community was designated by Canadian authorities as a terrorist organisation. A forensic audit found that WTM was running a pre-authorised payment programme that withdrew monthly sums from the bank accounts of Canadians. The WTM took in up to C\$763,000 a year using the scheme. Whilst some donors participated willingly, others had been coerced or pressurised.

Tamil Rehabilitation Organisation - Sri Lanka

The Tamil Rehabilitation Organisation (TRO) was established in 1985 in Tamil Nadu in south-eastern India by Tamil refugees fleeing the violence in North and East Sri Lanka. Its initial operation was to provide relief to the refugees in India. After the signing of the Indo-Sri Lanka Accord and the subsequent fighting between the LTTE and the Indian Peace Keeping Force, TRO moved its operation and headquarters to Jaffna in Northern Sri Lanka. The headquarters moved again to Killinochchi after Jaffna was taken by Sri Lanka Armed Forces in 1995.

After the signing of the ceasefire agreement in 2002 between the LTTE and the Government of Sri Lanka, TRO was recognised by the Government as a legitimate NGO and was granted NGO status. During the period 2002 to 2005 TRO operated from offices across Sri Lanka in both Government and LTTE controlled areas providing post war and post tsunami relief and rehabilitation to Tamil community. On 15 November 2007, the US Department of the Treasury designated the TRO under Executive Order 13224, aimed to financially isolate US designated foreign terrorist groups and their support network. Under this order, the Department of the Treasury froze all assets held by the TRO and its designees in US territories, and formally prohibited US citizens from transacting with the TRO or its members.

The Department of Treasury stated that "TRO passed off its operations as charitable, when in fact it was raising money for a designated terrorist group responsible for heinous acts of terrorism ... in the US, TRO has raised funds on behalf of the LTTE through a network of individual representatives. According to sources within the organisation, TRO is the preferred conduit of funds from the US to the LTTE in Sri Lanka".

South East Asia

South East Asia is a subregion of Asia, consisting of the countries that are geographically south of China, east of India, west of New Guinea and north of Australia. Southeast Asia consists of two geographic regions: Mainland Southeast Asia, also known as Indochina,

comprising Cambodia, Laos, Burma (Myanmar), Thailand, Vietnam and Peninsular Malaysia, and Maritime Southeast Asia comprising Brunei, East Malaysia, East Timor, Indonesia, Philippines, Christmas Island, and Singapore. The major religions are Islam and Buddhism, followed by Christianity. However, a wide variety of religions are found throughout the region, including many Hindu and animist-influenced practices. The major gangs and groups that operate in the region do so in the so-called Golden Triangle region, and the major terrorist threat is from Islamic terrorist groups that seek the establishment of an Islamic caliphate spanning Indonesia, Malaysia, southern Thailand, Singapore, Brunei, and the southern Philippines.

Indonesia

Indonesia is now the world's third most populous democracy, the world's largest archipelagic state, and the world's largest Muslim-majority nation. The Dutch began to colonize Indonesia in the early 17th century; Japan occupied the islands from 1942 to 1945. Indonesia declared its independence shortly before Japan's surrender, but it required four years of sometimes brutal fighting, intermittent negotiations, and UN mediation before the Netherlands agreed to transfer sovereignty in 1949. Indonesia's first President Soekarno declared martial law in 1957. After an abortive coup in 1965 by alleged communist sympathizers, Soekarno was gradually eased from power. From 1967 until 1988, President Suharto ruled Indonesia with his "New Order" government, becoming authoritarian and seen as fundamentally corrupt such that Transparency International named Suharto in 2004 as being the World's most corrupt leader. After rioting toppled Suharto in 1998, elections took place in 1999, albeit it wasn't until 2004 that the President was elected directly by the people. Susilo Bambang Yudhoyono therefore became Indonesia's first directly elected President and remains President after his re election

In 2005, Indonesia reached a historic peace agreement with armed separatists in Aceh, which led to democratic elections in Aceh in December 2006. Indonesia con-

tinues to face armed resistance in Papua by the separatist Free Papua Movement and from major indigenous terrorist groups, such as Jemaah Islamiyah, who carried out the 2002 Bali Bombings and a loose network of JI spin-off groups, and Jemaah Anshorut Tauhid, which obtain financial support from both domestic and foreign sources.

Most money laundering in Indonesia is connected to non-drug criminal activity such as illegal logging, theft, bank fraud, credit card fraud, maritime piracy, sale of counterfeit goods, gambling and prostitution. Indonesia has a long history of smuggling of illicit goods and bulk cash, facilitated by thousands of miles of unpatrolled coastline, sporadic law enforcement, and poor customs infrastructure. Proceeds from illicit activities are easily moved offshore and repatriated as needed for commercial and personal use.

Corruption remains a serious problem in Indonesia with according to Transparency International, Indonesia ranking 114 out of 175 countries in its 2013 Corruptions Perceptions Index.

In October 2012, the Financial Action Task Force (FATF) placed Indonesia on its Public Statement due to Indonesia's failure make sufficient progress in implementing its AML/CFT action plan. According to the FATF announcement, Indonesia should adequately criminalise terrorist financing; establish and implement adequate procedures to identify and freeze terrorist assets; and amend and implement laws or other instruments to fully implement the International Convention for the Suppression of the Financing of Terrorism.

Jemaah Islamiya - South East Asia/Indonesia

Southeast Asia-based Jemaah Islamiya (JI) is a terrorist group that seeks the establishment of an Islamic caliphate spanning Indonesia, Malaysia, southern Thailand, Singapore, Brunei, and the southern Philippines. More than 300 JI operatives, including operations chief Hamzali, have been captured since 2002, although many are free after serving short sentences. Those released include former JI emir Abu Bakar Bashir who was released from prison in 2006 after serving a 25 month sentence for his involvement in the 2002 Bali Bombings. Indonesia's Supreme Court later that year acquitted him of the charges. Bashir later formed Jamaah Anshorut Tauhid in 2008 and is considered a splinter group at JI with bases across Indonesia. Following the death of top JI bomb maker Azahari bin Husin in November 2005, along with the arrests of several close associates of senior JI operative Noordin Mat Top in 2006, and the 2007 arrests of former acting JI emir Muhammad Naim (a.k.a. Zarkash), JI military commander Abu Dujana, and several of their associates, the operational capabilities of the JI appear to have been reduced, putting an end to the spate of anti-Western attacks that had occurred annually from 2002-2005. The group's most high-profile attack took place in Bali in 2002, when the detonation of three bombs in a tourist district caused the death of 202

people (a total that included 88 Australians, 38 Indonesians, 27 Britons, 9 Americans and 5 Swedes). Analysts have concluded that the attack crippled Bali's tourist-oriented economy and by some estimates reduced Indonesia's overall economic growth by up to 1%. The financial impact of an operation thought to have cost as little as US\$50,000 to plan and execute was therefore considerable. A similar attack was also perpetrated in Bali on 1 October 2005, leaving 26 people dead, including the three suicide bombers. Other major JI attacks include the August 2003 bombing of the J. W. Marriott Hotel in Jakarta, and the September 2004 detonation of a bomb outside Jakarta's Australian Embassy. Prior to these more audacious attacks, in December 2000, JI coordinated bombings of numerous Christian churches in Indonesia and was involved in the bombings of several targets in Manila. In December 2001, Singaporean authorities also uncovered a JI plot to attack the US and Israeli Embassies, and British and Australian diplomatic buildings in Singapore. In February 2004, JI facilitated attacks in Manila, Davao, and General Santos City. Later, in 2007 the group planted an improvised explosive device (IED) in Sultan Kudarat that killed two civilians and injured thirty others. JI associates in the Philippines provide operational support and training for indigenous Muslim militants in the Philippines. The exact organisational strength of JI is currently unknown, however estimates of membership figures vary from the hundreds to one thousand. The group is based in Indonesia and is believed to have cells in Indonesia, Malaysia, and the Philippines. For instance JI associates based in the Philippines provide operational support and training for indigenous Muslim militants. JI is also known to have some links to Al-Qaeda, primarily in the form of funding and training. Despite these links JI has maintained its autonomy, remaining an independent group with its own agenda. Studies of the organisation have revealed that JI has a diverse range of income sources, an approach no doubt designed to make the group more robust in the face of asset seizures and any state crack-down. Revenue reaches the group via individual cash couriers, charities, corporate entities, hawala shops (underground banks), membership contributions, as well as the proceeds from the illegal gold and diamond trade, gun-running, kidnappings, extortion and racketeering.

Jemaah Anshorut Tauhid - Indonesia

Jemah Anshorut Tauhid (JAT) is an Indonesia-based group founded in 2008 by Abu Bakar Bashir, who was also the co-founder and former leader of Jemaah Islamiyah (JI), which was responsible for the 2002 Bali nightclub bombings that killed more than 200 people. JAT seeks to establish an Islamic caliphate in Indonesia, and has carried out numerous attacks on Indonesian Government personnel and civilians in order to achieve this goal. Abu Bakar Bashir, the founder and leader of JAT, was convicted and sentenced to prison in 2011 for his role in organizing a militant training camp in Aceh. JAT has robbed banks and carried out other illicit activities to fund the purchase of assault weapons, pistols, and

bomb-making materials. On 25 September 2011, a JAT suicide bomber detonated explosives inside a church in Central Java, killing the bomber and wounding dozens. Indonesian police arrested other JAT members in connection with this bombing and uncovered a plot for additional suicide attacks. In April 2011, a suicide bomber carried out an attack at a mosque in West Java that injured dozens of police officers and killed the bomber.

Free Papua Movement - Papua New Guinea

The former Dutch colony of West Papua, the western half of the island of New Guinea, came under temporary Indonesian control as part of a UN-managed "decolonisation" of the Dutch East Indies in 1963. It became a permanent part of Indonesia in 1969. The Free Papua Movement (OPM) is a political organisation that seeks independence from Indonesia for the indigenous people of West Papua. Insurgent operations against the Indonesian government and security forces are run by the group's military wing, the Liberation Army of the Free Papua Movement. The OPM's fundamental goal is self-rule combined with a return to a traditional mode of life. The group conducts small-scale raids and attacks on government offices and military installations, including a weapons depot in 2003. Members of OPM often retreat into Papua New Guinea to hide. Material support has been provided by both Libya and the New People's Army.

Malaysia

During the late 18th and 19th centuries, Great Britain established colonies and protectorates in the area of current Malaysia. These were occupied by Japan from 1942 to 1945. In 1948, the British-ruled territories on the Malay Peninsula except Singapore formed the Federation of Malaya, which became independent in 1957. Malaysia was formed in 1963 when the former British colonies of Singapore, as well as Sabah and Sarawak on the northern coast of Borneo, joined the Federation. The first several years of the country's independence were marred by a communist insurgency, Indonesian confrontation with Malaysia, Philippine claims to Sabah, and Singapore's withdrawal in 1965. During the 22-year term of Prime Minister Mahathir bin Mohamad (1981-2003), Malaysia was successful in diversifying its economy from dependence on exports of raw materials to the development of manufacturing, services, and tourism. Prime Minister Mohamed Najib bin Abdul Razak (in office since April 2009) has continued these pro-business policies and has introduced some civil reforms. Malaysia has established an offshore financial center on the island of Labuan which is home to both domestic and foreign banks and insurers.

Malaysia's long porous land and sea borders and its strategic geographic position increase its vulnerability to transnational criminal activity, including money laundering and terrorist financing. Malaysia is primar-

ily used as a transit country to transfer drugs originating from the southeastern Asian Golden Triangle and Europe. Drug trafficking is an important source of illegal proceeds in Malaysia. Iranian and Nigerian drug trafficking organisations are the main sources of illegal proceeds. Corruption is also considered a significant money laundering risk. Other crimes generating significant criminal proceeds in Malaysia include fraud, illegal gambling, credit card fraud, counterfeiting, robbery, forgery, human trafficking, extortion and smuggling. Smuggling of goods subject to high tariffs is a major source of illicit funds. Malaysia is a destination and, to a lesser extent, a source and transit country for women and children subjected to conditions of forced labour and women and children subjected to sex trafficking.

A number of terrorist organisations have been active on Malaysian territory, including *Jemaah Islamiyah* and *Abu Sayyaf*, whose aims include the establishment of an Islamic State encompassing Malaysia but also Borneo and the Philippines and south Thailand. Terrorist financing in Malaysia is predominantly carried out using cash and relies on trusted, clandestine networks.

Philippines

The Philippine Islands became a Spanish colony during the 16th century, which were ceded to the US in 1898 following the Spanish-American War. In 1935 the Philippines became a self-governing commonwealth. In 1942 the islands fell under Japanese occupation during World War II, and US forces and Filipinos fought together during 1944-45 to regain control. In 1946 the Republic of the Philippines attained its independence. A 20-year rule by Ferdinand Marcos ended in 1986, when a "people power" movement in Manila forced him into exile and installed Corazon Aquino as president. Her presidency was hampered by several coup attempts that prevented a return to full political stability and economic development. Fidel Ramos was elected president in 1992. His administration was marked by increased stability and by progress on economic reforms. In 1992, the US closed its last military bases on the islands. Joseph Estrada was elected president in 1998. He was succeeded by his vice-president, Gloria Macapagal-Arroyo in 2001 after Estrada's impeachment trial on corruption charges broke down and another "people power" movement demanded his resignation. Macapagal-Arroyo was elected for a six-year term as president in May 2004, with her term also marred by several corruption allegations. Current President Benigno Aquino III was elected for a six-year term as president in May 2010. The Philippine Government faces threats from several terrorist groups. Manila has waged a decades-long struggle against ethnic Moro insurrections in the southern Philippines, which has led to a peace accord with the Moro National Liberation Front and ongoing peace talks with the *Moro Islamic Liberation Front*. The decades-long Maoist-inspired New People's Army insurgency also op-

erates through much of the country. The Abu Sayyaf, a radical Islamic terrorist group, is active in the Southern Philippines and Malaysia, looking to establish an Islamic State in the region. It was responsible for the *Superferry 14* bombing in 2004. Also active with similar goals is *Jemaah Islamiyah*, whose members were responsible for the *Bali Bombings* in 2002.

Corruption remains a serious problem in the Philippines and a source of laundered funds. Smuggling, particularly bulk cash smuggling, is also a major problem. The Philippines continues to experience foreign organised criminal activity from groups in China, Hong Kong and Taiwan. In addition, insurgent groups operating in the Philippines engage in money laundering through ties to organised crime and criminal activities are partially funded through kidnapping for ransom as well as drugs and arms trafficking. The Philippines has a domestic methamphetamine problem which is growing. Marijuana is produced mainly in rural areas where Manila's control is limited but mainly for domestic use. Remittances sent to the Philippines by its large expatriate community also provide a channel for money laundering, however the bulk of these are captured by banks and money remitters.

Abu Sayyaf (ASG) - Philippines/Malaysia

The Abu Sayyaf Group (ASG), whose name translates to mean "Father of the Sword" in Arabic, is a radical Islamic terrorist group active in the Southern Philippines and Malaysia. Its stated goal is the creation of an independent Islamic state encompassing the areas of Southern Thailand, the island of Borneo, the Sulu Archipelago, and Mindanao, all of which are dominated by the Moro Muslim ethnic group. In order to fully comprehend the social milieu from which Abu Sayyaf emerged in the 1990s it is necessary to retrace the history of the Philippines back to the days of Spanish colonization. During this period, the nation experienced what has been described as 'evangelization with the sword' as Spanish colonizers attempted to replace all native denominations with the Christian faith. This proved a largely successful process, however one Muslim tribe in the country's south known as the Tausug remained unconquered. Following the Second World War this southern part of the Philippines suffered further Christian incursions when the government relocated many Christians from the north to the area. Land grabbing and much social strife ensued, finally expressing itself in the Moro Wars of the 1970s. It was from this environment of deep-seated ethnic and religious conflict that Abu Sayyaf surfaced in 1991. The ASG was founded by Abdurazzak Janjalani and other like-minded members of the Moro National Liberation Front (MNLF) who were dissatisfied with its leadership. In particular the MNLF's negotiations with the Philippine government were deemed unacceptable by these more radical militants. The ASG's principal founder, Abdurazzak Janjalani, was a Muslim cleric previously recruited and trained by bin Laden's *Al-Qaeda* in Afghanistan. Links between the two terrorist groups are believed to have been maintained, with

several of the AQ members responsible for executing the attacks on the US World Trade Centre in 2001 known to have undertaken numerous visits to the Philippines. The ASG also aligned itself with AQ's jihad against "Zionists and Crusaders" in 1998. Today Abu Sayyaf is renowned for seizing international hostages and possesses a gruesome reputation for beheading its victims. However the group was brought most forcefully into the consciousness of the international community by its links to an audacious three-phase terrorist attack during the mid-1990s. Known as the *Bojinka Plot*, the attack was to begin with the assassination of Pope John Paul II, followed by the bombing of 11 passenger planes bound for the US, and finally the hijacking and crashing of a plane into the CIA's headquarters in Virginia. While the plot was ultimately abortive, its scope revealed the ASG to be a highly dangerous terrorist organisation committed to causing large scale civilian losses. This commitment was again demonstrated in 2004 by the bombing of *Superferry 14* as it set sail from Manila; an attack that resulted in 116 fatalities. The organisation's funding, at least at its outset, is believed to have been supplied by bin Laden's brother-in-law Muhammad Jamal Khalifa. Khalifa has generated considerable amounts of money to finance terrorist operations via various charities such as the International Islamic Relief Organisation via its Philippine branch. In a leaked report by Colonel Rodolfo Mendoza of the Philippines it emerged that Khalifa had founded at least 8 front organisations in order to channel revenue to terrorist groups, including Abu Sayyaf. The ransoming of hostages, along with the extortion of Filipino communities is also known to provide part of the group's income. In terms of membership figures, the ASG was in 2003 believed to number less than 500 core militants, though its support network could number in the thousands. In 2002 the threat posed by the ASG was deemed sufficient to warrant the deployment of 600 US troops in the Philippines as part of the post 9/11 War on Terror. The military campaign was, however, a failure and a year later US troops withdrew having failed to eradicate the group. Today the ASG continues military operations in the Philippines, clashing in February 2013 with its former parent organisation the Moro National Liberation Front. The dispute arises following the MNLF's signing of a peace agreement with the Philippine government. Despite the agreement offering the Moro Islamic community broad autonomy, the ASG is one of several groups that have refused to adhere to a settlement.

New People's Army (NPA) - Philippines

The New People's Army was founded in 1969 in the Philippines as the armed wing of the outlawed Communist Party of the Philippines, Marxist-Leninist (CPP-ML). The group was formulated by 11 left-wing Filipino radicals who established as their goal the realisation of a socialist state. This socialist transformation of the Philippines was to be brought about by armed revolution, and as outlined by Maoist theory, would rely on the guerrilla warfare of a peasant population in revolt. On its inception the NPA constituted a small group

based in the mountainous areas of central and northern Luzon. In its early months any measure of military prowess at the group's disposal was provided by a group of agrarian rebels, and the NPA's meagre armoury is believed to have been made up of 70 weapons at most. Operating from a headquarters in northern Luzon the group attempted to use the area's natural caves as means of evading government forces. However within just a few weeks of the NPA's first operations it was forced to retreat into ever more remote hideouts in northern Luzon. Between 1969 and 1976 the NPA received considerable material support from the People's Republic of China, however when this aid ceased in 1976 the group entered a troubled five years in which its strength declined considerably. Nevertheless, having found alternative revenue sources such as the extortion of foreign businesses and the levying of taxes from supporters, the group had recovered by the early 1980s and experienced considerable growth in the following years. For instance by 1986 and the removal of *President Ferdinand Marcos* from power, the NPA had established a footing in 62 of the country's 73 provinces and commanded as many as 26,000 armed militants. The organisation's main support bases were located in the Filipino countryside and amongst the rural population though the NPA did receive notable support in Davao City. Despite the considerable size of the NPA its military capacities were far outweighed by those of the Filipino government. Consequently the NPA focussed on ambushes, assassinations and swift raids. High priority NPA targets have been Filipino politicians, security officials and news reporters. In terms of military control, the NPA could hold little ground by following the traditional guerrilla tactic of dispersing into forests and mountains after engagements, however in many rural areas the NPA and its parent CPP-ML organisation established itself as the de-facto government during the mid-1980s. Not only would the group levy taxes, but in many cases directed social services such as health care and sanitation. In 2002 the NPA was designated a terrorist organisation by the US, with the EU reaching the same conclusion in 2005. NPA attacks continued into 2011. However since the organisation's delisting as a terrorist group by the Government of the Philippines in 2011 peace talks began. Whilst hopes were raised that peace could be achieved after 44 years of insurgency and before President Benigno Aquino's term ends in 2016, peace talks collapsed in May 2013, and the NPA returned to former ways, attacking a major mining company in Central Philippines killing 5 soldiers and burning equipment and buildings. Today the NPA is believed to number around 10,000 members.

The Moro Islamic Liberation Front - Philippines

The Moro National Liberation Front (MNLF) was an Islamist group formed in the 1960s in the Southern Philippines. The group was most active in the Bangsamoro region of Mindanao, the Sulu Archipelago, Palawan, Basilan and other neighboring islands, operating with the aim to establish an independent Muslim nation. Whilst an offer of semi-autonomy in 1976 was accepted

by some it was also rejected by others, leading to the formation of a breakaway group, the Moro Islamic Liberation Front (MILF) who rejected government offers until 2007, when the Philippine government offered to recognise the right of self-determination for the Moro people which it had never done in three decades of conflict. Still it took until 2012, until President Benigno Aquino announced a firm peace deal with the MILF stating that "This framework agreement paves the way for a final and enduring peace in Mindanao". MILF Vice Chairman Ghazali Jaafar is quoted as saying "We are very happy. We thank the president for this." The deal was signed on 15 October 2012. Its aim is to pave the way to enduring peace between the two parties by officially envisaging an autonomous region in Mindanao. According to the peace deal, this semi-independent Muslim area would have a more just share of revenues from the extraction of resources, budgetary autonomy, its own police, and sharia law only for Muslims and in exchange the MILF will stop armed resistance against the government for autonomy and will allow the national government to retain its control of national security and foreign policy. The autonomy agreement to be gradually implemented will also rename the region Bangsamoro after the Moro people.

Rajah Solaiman Movement - Philippines

The Rajah Solaiman Movement (RSM) is a small terrorist organisation dedicated to creating an Islamic state in the Philippines. Founded in 2002, the group is named after Rajah Solaiman, a Muslim, who was the last indigenous King of Manila before Spanish rule began in the 1500s. RSM maintains close relationships with other terrorist groups including the ASG, Jemaah Islamiyah (JI), and the Moro Islamic Liberation Front (MILF). RSM is known to share members, training facilities, and funds with these terrorist organisations. One Filipino Army official speculated that generally, ASG plans operations, JI supplies funding, MILF provides safe houses for operatives, and RSM executes operations. Using illegitimate Filipino Islamic charities and its relationships with other prominent regional terrorist groups, RSM is able to fund its activities. Increasingly, it receives funding from sources in Saudi Arabia and other countries in the Middle East. RSM is suspected of acting in concert with the ASG, for example it was also involved in the Valentine's Day Superferry bombing that killed over 116 people in 2004.

Vietnam

Vietnam became independent from Imperial China in 938 AD, and successive royal dynasties flourished as the nation expanded into Southeast Asia until the Indochina Peninsula was colonized by the French in the mid-19th century. The name Vietnam translates as "Southern Viet". France took full control of Vietnam in 1884, becoming part of French Indochina in 1887, joining with Cambodia and later adding Laos. Following a Japanese occupation in the 1940s, the Vietnamese

fought French rule in the First Indochina War, with communist forces under Ho Chi Minh eventually expelling the French in 1954. In a peace deal, Vietnam was divided into the communist North and anti-communist South. US economic and military aid to South Vietnam grew through the 1960s in an attempt to bolster the government, and escalated into a full scale war, with US forces defeated and withdrawn in 1973. The country was reunited in 1975 and a one-party system led by the Communist Party of Vietnam (CPV), has ruled since unification. Since 2000, Vietnam's economic growth rate has been among the highest in the world, following successful economic reforms. The most recent presidential elections held 2011, saw Truong Tan Sang, the incumbent, re-elected by the deputies (members) of the National Assembly. Vietnam has an estimated 90.3 million inhabitants as of 2012 and it is the world's 13th-most populous country, and the eighth-most populous Asian country. Vietnam's economy is largely cash-based, with both US\$ and gold widely used as a means of exchange and storing value. Sources of illicit funds in Vietnam include public corruption, fraud, gambling, prostitution, counterfeiting of goods and trading in counterfeit merchandise, illegal wildlife trade, and trafficking in persons. Remittances from the proceeds of narcotics trafficking in Canada, the UK, and the US are a significant source of money laundering, as are narcotics proceeds from traffickers using Vietnam as a transit country. Vietnam's banking sector is considered at risk due to a large government ownership and control and at risk for money laundering. Corruption remains a serious problem in Vietnam with according to Transparency International, Vietnam ranking 123 out of 174 countries in its 2012 Corruption Perceptions Index. The Financial Action Task Force (FATF) included Vietnam in its Public Statement, acknowledging that, although Vietnam has taken steps toward improving its anti-money laundering/counter-terrorist financing (AML/CFT) regime, Vietnam has not made sufficient progress in implementing its action plan, and certain strategic AML/CFT deficiencies remain.

Golden Triangle Cartels

The Golden Triangle, stretching across Myanmar, Thailand and Laos, has been one of the world's leading production centres of heroin for decades. Myanmar is the most predominated origin state in the region. More than three quarters of Myanmar's production supplies the local and regional markets, mainly Chinese market. The rest flows to other Southeast Asian countries. Criminal gangs and insurgent groups are involved in trafficking drugs, humans, wildlife, gems, timber, and other contraband. Widespread collusion between organised gangs, traffickers and Myanmar's ruling military junta, is suspected. In addition most of the insurgent groups are also organised crime groups. There were at least 16 different armed groups controlling parts of the Shan State and the Kayah State. Being isolated from other sources of income, many of the insurgent groups

turned to taxing of drug production as a major source of revenue as well as taxing timber, gems, and other black-market goods passing through the territories which they control. One major business interest for organised criminal gangs include illegal gambling, particularly in the border area and operating in some hotels.

Thailand

A unified Thai kingdom, known as Siam was established in the mid-14th century, changing its name in Thailand in 1939. Thailand is the only Southeast Asian country never to have been taken over by a European power. A bloodless revolution in 1932 led to a constitutional monarchy. In alliance with Japan during World War II, Thailand became a US ally in 1954 after sending troops to Korea and later fighting alongside the US in Vietnam. Since 2005, Thailand has experienced political turmoil including a military coup in 2006 that ousted then Prime Minister Thaksin Chinnawatra (criticisms and allegations of corruption) and then followed by large-scale street protests by competing political factions ever since. In 2011, Thaksin's youngest sister, Yingluck Chinnawatra, won elections and assumed control of the government, but the government is struggling to survive with opposition demonstrations demanding a change in the government. Thailand has an extremely porous border and is vulnerable to money laundering within its own underground economy as well as to many categories of cross-border crime, including contraband smuggling including illicit narcotics where Thailand is a minor producer of opium, heroin, and marijuana and a transit point for illicit heroin en route to the international drug market from Myanmar and Laos. Thailand is a source, transit, and destination country for international migrant smuggling and trafficking in persons, a production and distribution center for counterfeit consumer goods and a center for the production and sale of fraudulent travel documents. The proceeds of illegal gaming, corruption, underground lotteries, and prostitution are laundered through the country's financial system. The Thai black market includes a wide range of pirated and smuggled goods, from counterfeit medicines to luxury automobiles. Money launderers and traffickers use banks, as well as non-bank financial institutions and businesses, to move the profits of narcotics trafficking and other criminal enterprises. In the informal money changing sector, there is an increasing presence of hawalas via money shops that service Middle Eastern travellers in Thailand. Thailand was publicly identified by the Financial Action Task Force (FATF) in February 2010 for its strategic anti-money laundering/counter-terrorist financing (AML/CFT) deficiencies, for which it has developed an action plan. In October 2012, the FATF determined that Thailand's progress against the agreed action plan's timeline continues to be insufficient and the Government of Thailand (GOT) needs to take adequate action to address its main deficiencies. Since January 2004, thousands have been killed and wounded in violence associated with the ethno-nationalist insur-

gency in Thailand's southern Malay-Muslim majority provinces which prompt border closures and controls with Malaysia to stem insurgent activities.

Jao/Chao Pho - Thailand

Primarily ethnic Chinese in Thailand using legitimate businesses as fronts for crime and infiltration of the police, military and government. As a result of its name, which translates literally as 'godfather', this group has often been considered simply as Thailand's expression of the Italian-American style gangster that its name evokes. This is however a misconception. The Chao Pho demonstrate many characteristics of traditional Thai leaders known as the nak leng. These leaders were considered firm but generally fair, and showed particular loyalty to their fortunate benefactors. As a result Nak Leng and the Chao Pho that have come to replace them in many of Thailand's provinces, maintain their seats of power by a mixture of intimidation, bribery and indeed support. Today Chao Pho, despite their links to criminal enterprise, maintain close connections with high ranking state officials. Common criminal activities amongst Chao Pho include corruption, illegal gambling such as the underground lottery, prostitution and drug trafficking. They have also traditionally had dealings with more mainstream financial institutions, forging particularly close knit connections with Thailand's rural banks. As late as the 1960s Chao Pho played an important role in provincial bank branches, ensuring that repayments were made and attracting new clients. Banks have also been used as depositories for the illegal funds generated through schemes such as the underground lottery. The Chao Pho did not however conduct only illegal business; rather they expanded into legitimate commerce, most notably construction, logging, transportation and the distribution of whiskey. Politics also became a major occupation of the Chao Pho from the 1970s onwards, at first using their networks of influence to support chosen figures, but later standing in elections themselves.

Laos

Modern-day Laos has its roots in the ancient Lao kingdom of Lan Xang, established in the 14th century. For 300 years Lan Xang had influence reaching out from Laos into present-day Cambodia and Thailand. Laos was then dominated first by Siam (Thailand) and then from the late 18th century as part of French Indochina. In 1975, Communists took control of the government ending a six-century-old monarchy and instituting a strict socialist regime closely aligned to Vietnam, which has since liberalized, particularly as regards private enterprise. Along with China, Cuba, Vietnam, and North Korea, Laos is one of the world's five remaining socialist states, whose government is headed by President Choummaly Sayasone and Prime Minister Thongsing Thammavong. Laos is positioned at the crossroads of mainland Southeast Asia's drug trade, with also an estimated domestic opium poppy cultivation problem too and with corruption endemic, bulk cash smuggling

commonplace, it's easy to see why Laos is vulnerable to money laundering activities. Furthermore, the gaming industry, primarily driven by Chinese tourists visiting casinos in Special Economic Zones near the border, continue to present money laundering opportunities outside of the formal financial sector.

Myanmar

Myanmar (also known as Burma) is the second largest country in Southeast Asia, with a population of over 60 million. Myanmar is subject to certain Sanctions and Embargoes, for details see Part 1, Section 3, Money Laundering Laws and Regulations: Sanctions and Embargoes above. Myanmar is predominately a cash-based economy with less than 20% of the population accessing the formal banking system. It is also a "US dollarised" economy with US dollars readily accepted at shops and retail outlets. Myanmar was once one of the wealthiest countries in Southeast Asia. However, in 1962 General Ne Win overthrew the elected civilian government and replaced it with a repressive military government, regularly accused of Human rights abuses. The military government isolated Myanmar from the international community and poor economic performance followed. The military government was criticised by most of the international community for using force to respond to demonstrations in 1988 and refusing to honor the results of the 1990 elections in which the National League for Democracy (NLD) led by Aung San Suu Kyi received 62% of the votes cast, taking some 80% of the 485 seats contested. In response to the human and political rights issues in Myanmar, the US imposed economic sanctions against the country in 1990, which were followed by Sanctions from others, including the EU. Improvements under leader Thein Sein who took over from former dictator, General Than Shwe in 2010 led to reform negotiations with Aung San Suu Kyi and it appears Myanmar is now set on a new course after decades of military rule. The political reforms included allowing Aung San Suu Kyi to run for parliament and releasing political prisoners. In response, EU and Switzerland as well as the US suspended most of the sanctions against Myanmar. Myanmar remains one of the most corrupt countries in the world. In the most recent Corruption Perception Index in 2013 published by Transparency International, Burma's rank was 157 out of 175. The only countries that ranked worse were Somalia and North Korea. For decades, Burma's military leaders divided up the country's national wealth among themselves and their business friends, for example most recently in 2010-11, by transferring state assets, especially real estate, to military families under the guise of a privatization policy further widening the gap between the economic elite and the public, many of whom live in poverty. Terrorism in Myanmar primarily consists of anti-government militant activity. Militant separatists in India, such as the United Liberation Front of Assam and the United National Liberation Front, have bases in Myanmar from which they launch attacks into India.

Notable incidents in Myanmar include the 1983 Rangoon bombing, allegedly by North Korean agents, and three bombings on 7 May 2005 in the capital which killed 11 and injured more than 150. Ethnic rebels were blamed. Transnational or major organised crime groups, for example Jao/Chao Pho, United Wa State Army/Red Wa and Khun Sa Cartel operate in Myanmar and in particular in the Golden Triangle region.

Khun Sa Cartel - Myanmar

"Money Tree" to his supporters and "Prince of Death" to his foes, Khun Sa was a drug trafficker and self-proclaimed freedom fighter operating in Myanmar. Khun Sa was a guerrilla fighter originally fighting for the independence and creation of a "Shan" state from Burma before turning to the drugs trade in the 1960s. Having left the Myanmar army Sa set about establishing his own private army and embarked on conflicts with other drug trafficking groups. The fighting was dubbed the Opium Wars and proved highly unsuccessful, leaving his organisation in tatters and Sa himself behind bars. However after his release in 1974 and the arrest of the area's other foremost drug lord, Sa flourished and as a result Sa's power grew to such an extent that it is estimated that 20,000 men served amongst the ranks of his private army at the height of its strength, and Sa's network is believed to have controlled around half of all the opium produced in the Golden Triangle annually. Khun Sa also boasted a vast legal commercial empire. In 1999 Sa was arrested by Myanmar troops, however the country refused to allow his extradition to the US for trial on drug trafficking charges despite a US\$2mio reward being offered by the US. Instead Khun Sa was allowed by Burma's ruling generals to live out the rest of his life in Rangoon until his death in 2007.

United Wa State Army or Red Wa - Myanmar

The United Wa State Army, also known as Red Wa, is based in Myanmar's Special Region Number 2 and is the military wing of the United Wa State Party. Founded by Chao Ngi Lai and later led by Bao Youxiang, the organisation emerged after the collapse of the Communist Party in Burma and received strong support from China. The group has emerged as one of Southeast Asia's foremost drug producers, manufacturing methamphetamine and heroin with very little intervention from the Myanmar government. This immunity from prosecution was further strengthened by a 2008 constitutional ruling that awarded the United Wa State Army control of two "self administered" districts in northeastern Shan state. Consequently Myanmar has emerged as the second highest opium producing state in the world, surpassed in 2011 only by Afghanistan. This large scale involvement in the drugs trade serves primarily to fund the UWSA's resistance to the Myanmar government; financing the group's 30,000 strong standing army. Alongside the production and trafficking of opium, the UWSA also levies illegal taxes that are little different from outright extortion.

Eastern Asia

More than 1.5 billion people, about 38% of the population of Asia or 22% of all the people in the world, live in East Asia, including China & Taiwan, Japan, N & S Korea, and Mongolia. Historically, many societies in East Asia have been part of the Chinese cultural sphere, and East

Asian vocabulary and scripts are often derived from Classical Chinese and Chinese script. The history of East Asia is predominantly the Chinese Dynasties but also the great empires built at home and conquered abroad. East Asians made an impact outside of their region, including not only into Central Asia but also into the heart of Europe. For example both Attila the Hun and Genghis Khan were two of the greatest conquerors the world has ever known. Attila the Hun, in the early 5th Century AD ruled over an empire that stretched from modern-day Uzbekistan to Germany, and from the Baltic Sea in the north to the Black Sea in the south. His people, the Huns, moved west to Central Asia and Eastern Europe after leaving the East Asian homelands. Genghis Khan, a Mongol leader in the late 12th Century conquered an empire larger than Rome's at the peak of its power. Still East Asia is best known for its Chinese Rulers who dominated in trade as well as military, such as the Qin and the Han Dynasties. There are records of tributes sent overseas from the early kingdoms of Korea and Japan, but as connections began to strengthen with the Western world, Chinese power began to diminish. Japan took the opportunity to begin conquering colonies. At the time of the start of WWII, Korea, Taiwan and the Northeastern part of China were all under Japanese control. It was not until the end of WWII when Korea and Taiwan had a chance to free themselves from Japan.

According to the UN Office on Drugs and Crime (UNODC), in its report "Transnational Organised Crime in East Asia and the Pacific: A Threat Assessment" organised crime groups dealing in fake goods, drugs, human trafficking and illicit wildlife trade earn nearly \$90 billion annually in East Asia and the Pacific. It estimates that the trade in counterfeit goods earns most (US\$24.4bio), followed by illegal wood products (US\$17bio), heroin (US\$16.3bio) and methamphetamines (US\$15bio). Fake medicines (US\$5bio), the black market trade in used electronics components to avoid legitimate recycling (US\$3.75bio) and the illegal wildlife trade (US\$2.5bio). Migrant smuggling and the trafficking of women and girls for prostitution or general labour also earn hundreds of millions of dollars each year.

China

According to Chinese tradition, the first imperial dynasty was the Xia, who emerged around 2000 BC. The first Chinese dynasty that left historical records, the loosely feudal Shang, settled along the Yellow River in eastern China from the 17th to the 11th century BC. The Shang

were conquered by the Zhou, who ruled between the 12th and 5th centuries BC who centralized authority was slowly eroded by feudal warlords. Many independent states eventually emerged from the weakened Zhou state, and continually waged war over 300 years. By the time of the 5th–3rd centuries BC there were seven powerful sovereign states in what is now China, each with its own king, ministry and army. The Warring States period ended in 221 BC after the state of Qin conquered the other six kingdoms and established the first unified Chinese state. The word "China" is commonly thought that the word is derived from the Qin Dynasty.

The Great Wall of China was built by several dynasties over two thousand years to protect the sedentary agricultural regions of the Chinese interior from incursions by nomadic pastoralists of the northern steppes. The subsequent Han Dynasty ruled China between 206 BC and 220 BC and created a lasting Han cultural identity among its populace that has endured to the present day. The Han Dynasty expanded the empire's territory considerably with military campaigns reaching Korea, Vietnam, Mongolia and Central Asia, and also helped establish the Silk Road in Central Asia. Han China gradually became the largest economy of the ancient world. The Han Dynasty adopted Confucianism, a philosophy developed as its official state ideology.

In the 13th century, China was gradually conquered by the Mongol empire. In 1271, the Mongol leader Kublai Khan established the Yuan Dynasty, which itself was overthrown in 1368 with the establishment of the Ming Dynasty. Under the Ming Dynasty, China enjoyed another golden age, developing one of the strongest navies in the world and a rich and prosperous economy amid a flourishing of art and culture. It was in this period that China's capital was moved from Nanjing to Beijing. The Qing Dynasty, which lasted from 1644 until 1912, was the last imperial dynasty of China.

In the 19th century, the Qing Dynasty experienced Western imperialism following two Opium Wars with Britain. China was forced to sign unequal treaties, pay compensation, allow extraterritoriality for foreign nationals, and cede Hong Kong to the British. The First

Sino-Japanese War (1894–95) resulted in Qing China's loss of influence in the Korean Peninsula, as well as the cession of Taiwan to Japan. The weakening of the Qing regime led to increasing domestic disorder and numerous rebellions as well as famine. In the 19th century, the great Chinese Diaspora began. The ill-fated anti-Western Boxer Rebellion of 1899–1901 further weakened the Qing Dynasty. The Xinhai Revolution of 1911–12 brought an end to the Qing Dynasty and established the Republic of China (1912–1949) which was established and led by Sun Yat-sen of the Kuomintang (the KMT or Nationalist Party) and later under Chiang Kai-shek. In 1927 the Chinese Civil War was fought between the Kuomintang and the Communists until Japanese aggression and the Second Sino-Japanese War (1937–1945), a part of World War II, forced an uneasy alliance between the Kuomintang and the Communists. Japanese forces committed numerous war atrocities against the civilian population; in all, as many as 20 million Chinese civilians died. An estimated 200,000 Chinese were massacred in the city of Nanjing alone during the Japanese occupation. Japan unconditionally surrendered to China in 1945.

Major combat in the Chinese Civil War ended in 1949 with the Communist Party Chairman Mao Zedong proclaimed the establishment of the People's Republic of China in control of mainland China, and the Kuomintang retreating to Taiwan.

Mao encouraged population growth, and under his leadership the Chinese population almost doubled from around 550 million to over 900 million. However, Mao's Great Leap Forward, a large-scale economic and social reform project, resulted in an estimated 45 million deaths between 1958 and 1961, mostly from starvation. Between 1 and 2 million landlords were executed as "counterrevolutionaries." In 1966, Mao and his allies launched the Cultural Revolution, sparking a period of political retribution and social upheaval which lasted until Mao's death in 1976. In October 1971, the PRC replaced the Republic of China in the UN, and took its seat as a permanent member of the Security Council. After Mao's death in 1976 and the arrest of the faction known as the Gang of Four, who were blamed for the excesses of the Cultural Revolution, Deng Xiaoping took power and led the country to significant economic reforms. The Communist Party subsequently loosened governmental control over citizens' personal lives and the communes were disbanded in favor of private land leases. This turn of events marked China's transition from a planned economy to a mixed economy with an increasingly open market environment. Deng developed "Socialism with Chinese characteristics" and Chinese economic reform, also known as the "socialist market economy", and opened China to the global market. Deng is famous for saying in a 1977 speech that; "It doesn't matter whether the cat is black or white, as long as it catches mice." He also compared Chinese Politics to American remarking that; "the US brags about its political system, but the [American] President says one

thing during the election; something else when he takes office, something else at midterm and something else when he leaves." China adopted its current constitution on 4 December 1982. In 1989, the violent suppression of student protests in Tiananmen Square brought worldwide condemnation and sanctions against the Chinese government.

President Jiang Zemin and Premier Zhu Rongji led the nation in the 1990s. Under their administration, China's economic performance pulled an estimated 150 million peasants out of poverty and sustained an average annual gross domestic product growth rate of 11.2%. The country formally joined the World Trade Organisation in 2001, and maintained its high rate of economic growth under Hu Jintao's presidency in the 2000s. However, rapid growth also severely impacted the country's resources and environment, and caused major social displacement. Living standards continued to improve rapidly despite the late-2000 recession, but centralized political control remained tight. Preparations for a new Communist Party leadership change in 2012 were marked by factional disputes and political scandals. During China's 18th National Communist Party Congress in November 2012, Hu Jintao and Wen Jiabao were replaced as President and Premier by Xi Jinping and Li Keqiang, who formally took office in 2013.

China Designated Terrorist Organisations

China Ministry of Public Security issued a list in 2003 of terrorist organisations, focussed on East Turkistan, listing the following organisations:²¹ the Eastern Turkistan Islamic Movement (ETIM); the Eastern Turkistan Liberation Organisation (ETLO); the World Uyghur Youth Congress (WUYC) and the Eastern Turkistan Information Center (ETIC).

The Chinese government alleges that ETIM is comprised of eight major factions, which are committed to terrorist attacks in the name of an Eastern Turkistan Islamic state: Central Asian Uygur Hezbollah (Kazakhstan), East Turkistan Liberation Organisation (ETLO), Eastern Turkistan International Committee, Eastern Turkistan Islamic Movement (Afghanistan), Eastern Turkistan Islamic Resistance Movement (Turkey), Eastern Turkistan Youth League (Switzerland), Turkistan Party (Pakistan), and the United Committee of Uyghurs' Organisations (Central Asia).

It is unclear whether or not most of these are actual terrorist groups, and if so whether or not these are actual factions of ETIM. ETLO's known to be a terrorist group that supports ETIM's cause and could possibly be an ally of ETIM as well. ETIM has been implicated in terrorist plots against US interests in the Central Asia region, including a foiled plot to attack the US Embassy in Kyrgyzstan.

World Uyghur Youth Congress - China/Xinjiang

Xinjiang is the north western province of China, about twice the size of Turkey and home to about 9 million

Uyghurs, many of whom complain about religious and cultural suppression by Chinese authorities and seek the establishment of a self-governing, independent state called East Turkistan. Some of the more important groups that support independence for East Turkistan and also labelled terrorist organisations, by Chinese and/or the US include the World Uyghur Youth Congress, East Turkistan Information Centre, East Turkistan Islamic Movement and East Turkistan Liberation Organisation.

The Eastern Turkistan Islamic Movement - China/Xinjiang

The Eastern Turkistan Islamic Movement (ETIM) is an Islamist extremist group based in China's Xinjiang-Uyghur Autonomous Region. ETIM is an ethnic Uyghur separatist organisation that aims to create an Islamist state in the Xinjiang province. The area commonly referred to as Turkistan is sometimes split into Western Turkistan and Eastern Turkistan.

Western Turkistan was controlled by the Russian empire and then by the USSR, and so the area is also referred to as Russian Turkistan.

The USSR treated this area as an autonomous region. Following the dissolution of the USSR, the region was split among five new republics, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan.

In contrast, Eastern Turkistan has long been a part of China and is sometimes referred to as Chinese Turkistan. Today, the region is officially referred to as the Xinjiang-Uyghur Autonomous Region. While the Eastern Turkistan Islamic Movement's name would suggest that the group is interested in creating an Islamic state exclusively in the Xinjiang province ("Eastern Turkistan"), some analysts have stated that the group aims to create a new state that would include portions of Turkey, Kazakhstan, Kyrgyzstan, Pakistan, Afghanistan, and Xinjiang.

ETIM is not the only terrorist group committed to an Islamic state in the Turkistan area; the Islamic Movement of Uzbekistan (IMU) is another significant terrorist operation pushing for a theoretical Islamic Turkistan state. Claims that ETIM has ties to Al-Qaeda and the Taliban persist. Many reputable sources debate whether or not Al-Qaeda has provided the group with training and financial assistance. The US Department of State, in its 2005 report on terrorism, states that ETIM is "linked to Al-Qaeda and the international jihadist movement" and that Al-Qaeda has provided ETIM with "training and financial assistance". Another US government website reports that one ETIM leader was killed in a raid on Al-Qaeda safehouses in Pakistan.

The Chinese government, it has been suggested, has been known to exaggerate the connection between ETIM and Al-Qaeda to enlist the support of the US in endorsing China's social control tactics in Xinjiang. It is

likely that members of ETIM have had contact with Al-Qaeda elements, but no high-level contacts have been established. As far as the group's strength is concerned, ETIM has been described as a small terrorist operation and the group demonstrates limited allegiance among the ethnic Uyghurs of the Xinjiang province. Furthermore, China shows absolutely no signs of acquiescing to any of ETIM's terrorist demands. In fact, the Xinjiang province is important to China both for its strategic location and its abundant natural resources.

Chinese Black Societies

Criminal gangs are found throughout China but are most active in Chongqing, Shanghai, Macau, Tianjin, Shenyang, and Guangzhou as well as in Hong Kong and Taiwan. The number of people involved in organised crime has risen from around 100,000 in 1980 to around 1.5 million in 2000. New members are often recruited among the 120-million-strong "floating population" of migrant workers. Organised crime gangs in China are known as "black societies." The private intelligence firm Stratfor said that, unlike in Russia and Italy, organised crime was "extremely localised." Many criminals work in small, loosely-knit gangs that are involved in armed robbery, racketeering, smuggling, narcotics trafficking, prostitution, gambling and even contract murder. When groups begin to outgrow their local area, the government crack down on them heavily.

One of Henan Province's worst gangs roamed the countryside unchecked for 13 months, robbing farmhouses and killing 76 people. Seven members of the gang, including its leader Peng Miaoji, who personally cut the throat of 40 victims, were captured and executed in December 1999. Some gangs have close relations with the police and are even run by the police. In March 2007, 10 members of a police-run gang in Inner Mongolia were sentenced to up to 20 years in prison for robbery, rape, gambling and bribery. The gang had been active for more than 10 years. Whilst much of the organised crime in China is local there are exceptions and heading the list for the largest and most powerful in China as well as transnationally are the Triads, operating in China, Hong Kong, Macao, Taiwan and beyond.

Tongs - China

Tongs are similar to Triads except that they originated among early immigrant Chinatown communities independently, rather than as extensions of modern triads. The word literally means "social club," and Tongs are not specifically underground or criminal organisations. The first Tongs formed in the second half of the 19th century among the more marginalized members of early immigrant Chinese American communities for mutual support and protection. These Tongs modeled themselves on Triads, becoming involved in criminal activities such as extortion, illegal gambling, human trafficking, murder and prostitution. In recent years, some Tongs have reformed to eliminate their criminal elements and have become civic-minded organisations.

Special Focus 11

Triads - China/Hong Kong/Macau & Taiwan

China's Triads, whose history may go back as much as 2000 years, were originally secret societies. These societies grew following the overthrow of the Ming dynasty in 1644, to oppose the foreign Ch'ing (Manchu) dynasty. The term Triad is neither Cantonese nor Mandarin but was first coined by the British authorities in colonial Hong Kong, as a reference to the triads' use of triangular imagery and where membership of a triad society was prohibited and a criminal offence since 1949.

For centuries after the Triads embedded themselves in Chinese society, frequently engaging in various kinds of criminal and other illegal activity. The Triads played a major role in the Chiang Kai-shek regime gradually increasing the scope of their criminal activities, but they were enemies of the Communists and had to flee after the Communists came to power in 1949.

The Triads left settling mostly in Hong Kong, but also Macau and in Taiwan and also represented in countries with significant Chinese populations, such as Malaysia, Singapore, the US, Canada, Australia and the UK.

The Triads are considered to have more than 100,000 members and are involved in extortion, protection rackets, gun running, smuggling, fraud, drug trafficking, counterfeit goods as well as Human Trafficking but their main areas of involvement are Illegal gambling and loan sharking. Illegal gambling has long been a main stay of criminal activity for triad gangs and despite heavy police action continues to be a problem. Gambling in Hong Kong is only legal through the Hong Kong Jockey Club and only in respect of certain sporting activities.

Illegal casino, bookmaking and loan sharking operations also extend to Macau, Shenzhen and Guangdong Province. In 2001, the Hong Kong Government estimated that the annual turnover of illegal football betting alone was US\$2.5bio. Loan sharking is often connected to the Triads activities with Illegal Gambling.

A common scenario involves victims being induced to gamble more than they can afford in the VIP rooms at Macau casinos or in Illegal gambling dens. The victim is then held pending reimbursement. Family members are encouraged to make payments to free their relative,

with settlement being made by bank transfers, which are structured through a series of nominee or front accounts.

There are around 50 known Triad societies in Hong Kong, of which about 15 regularly come to Police attention, though the clandestine nature of Triad activity makes it difficult to make an accurate assessment of triad membership. Sun Yee On and 14K are the two largest and well known but other large gangs include Wo Shing Wo, Wo Hop To and Wo On Lok, which all together account for the majority of triad-related crimes in Hong Kong. Some triads or their factions operate only within a particular district and others disperse after a short time. The Hong Kong Police estimate Triad gangs are responsible for 3% of the city's crime.

Sun Yee On - China/HK

Sun Yee On or the New Righteousness and Peace Commercial and Industrial Guild, is the largest Triad gang based in Hong Kong and Mainland China, with more than 55,000 members worldwide. It is also believed to be active in the UK, the US, France, Belgium, and the Netherlands. Sun Yee On was founded in 1919.

14K - Hong Kong

The 14K is a Triad group based in Hong Kong but active internationally. It is the second largest Triad group in the world with around 20,000 members split into thirty subgroups. They are the main rivals of the Sun Yee On. The 14K are responsible for large-scale drug trafficking around the world, most of it heroin and opium from China or Southeast Asia as well as illegal gambling, money laundering, arms trafficking, prostitution, people smuggling, extortion, counterfeiting and, to a lesser extent robberies. The 14K was formed by Lieutenant-General Kot Siu-wong in Guangzhou, China in 1945 as an anti-Communist action group, relocating to Hong Kong in 1949 when the Kuomintang fled from the Communists following the Chinese Civil War. Originally there were fourteen members who were part of the Kuomintang, hence the name 14K. Compared with other Triad societies, the 14K is one of the largest and most violent Hong Kong based Triad societies, and its members appear to be more loosely connected.

Dai Huen Jai - China

The Dai Huen Jai are not a Triad gang but a Chinese criminal gang and a curious product of Mao Zedong's Cultural Revolution. On Mao's death much of the para-military Red Guard were sent to "re-education" camps, where they suffered abuse and emerged as an organised criminal syndicate involved in the same criminal activities as the Triads, i.e. drug trafficking, loan-sharking, human-trafficking, fraud, counterfeiting, prostitution, fraud, human trafficking, albeit not operating as a formal organisation but now operating in loose confederations throughout Asia, the Americas and Australia.

Taiwan

In 1895, military defeat forced China to cede Taiwan to Japan. Taiwan came under Chinese Nationalist control after World War II. Following the communist victory on the mainland in 1949, 2 million Nationalists fled to Taiwan and established a government using the 1947 constitution drawn up for all of China. Beginning in the 1950s, the ruling authorities gradually democratized and incorporated the local population within the governing structure. This process expanded rapidly in the 1980s.

In 2000, Taiwan underwent its first peaceful transfer of power from the Nationalist to the Democratic Progressive Party. Throughout this period, the island prospered and became one of East Asia's economic "Tigers." The dominant political issues continue to be the relationship between Taiwan and China, specifically the question of Taiwan's eventual status, as well as domestic political and economic reform.

Taiwan is regional transit point for heroin, methamphetamine, and precursor chemicals and a transhipment point for drugs to Japan. There is a major problem with domestic consumption of methamphetamine and heroin. Organised crime in Taiwan is dominated by Heijin gangsters, the Heavenly Alliance Gang, the Four Seas Gang and Triad groups like the United Bamboo.

Heijin - Taiwan

Taiwanese gangsters get more done when they infiltrate business or politics. A third of the government's officials are current or former members. "Heijin" which means "black gold politics" and involves the evolution of organised crime in Taiwan, turning gangsters into businessmen and some into politicians. Researchers and scholars published figures for 1996 that estimated that 106 of the more than 360 major companies in Taiwan had been infiltrated by corrupt politicians, gangsters and oftentimes both. The major organised crime gangs in Taiwan are the United Bamboo, the Heavenly Alliance Gang and the Four Seas Gang all involved in "Heijin".

United Bamboo - Taiwan

Believed to be Taiwan's top Triad gang with as many as 10,000 members, United Bamboo operates according to a decidedly old-school code of ethics that stresses unity among members as well as "harmony with the people." Although they have repeatedly denied it, United Bamboo is believed to be entrenched in drug trafficking, and their sphere of influence may even stretch into the KMT, Taiwan's ruling political party, as well as throughout Asia, the Pacific, Europe, and the Americas. Unlike other syndicates, United Bamboo is not overseen by a single boss, but rather has a more horizontal structure to its hierarchy.

Heavenly Alliance Gang - Taiwan

This Taiwanese gang came into existence in 1986 at the Taipei Detention Centre and purported to follow the spiritual leadership of Lo Fu-chu. The founding of the organisation took place in a ceremony that established branches and their respective heads, of which there were originally 6. Expansion since then has been extensive, the total number of branches swelling from 6 to 14 in 1996, and 30 in 2004. Each branch possesses a firm hierarchical structure, typically descending from the branch leader, to deputy branch leaders, advisers, unit chiefs, combat teams and members. Relationships between branches of the Heavenly Alliance are not always harmonious, the war between the new and old Sun branches being a particularly violent expression of tensions within the group. The recruitment strategy of the Heavenly Alliance is much like that of its rival Taiwanese gangs United Bamboo and the Four Seas; targeting students and school drop outs. Membership in the gang is obtained by means of a simple pledge, committing each recruit to the following four aims: i) to help heaven by dispersing justice, assisting the weak and the poor ii) to conduct oneself with honesty amongst fellow members iii) to follow the example of heaven and earth; acting with empathy and justice iv) to fly as high as possible; to extend justice around the world. The gang itself is heavily armed and commonly resorts to violence. The areas of criminal activity in which the Heavenly Alliance is most heavily committed include gambling, prostitution, debt collection, bid rigging, illegal futures trading, waste land disposal, extortion and protection rackets.

The Four Seas Gang - Taiwan

Another major organised crime gang operating in Taiwan is the Four Seas. The group is thought to have around 50,000 members and has extended its reach to some American cities. In particular the Four Seas is known to have connections with human trafficking in southern California. In terms of structural organisation the Four Seas has three primary positions of leadership at its pinnacle; those of the chairman of the committee, the deputy chairman, and the standing members of the committee. Members of the standing committee are elected by their constituent sects, or tongs, which they represent in meetings. The directives emerging from these meetings are then relayed to the separate tongs for implementation. In terms of growth the number of tongs aligned to the Four Seas has swelled from 11 in 1997 to more than 40 in 2006. A high proportion of the gang's membership is derived from school and college drop-outs, however for the most part these individuals fill periphery roles. Core roles are predominantly occupied by more long-standing criminals. Originally the gang derived its revenue from overtly criminal sources such as protection, debt collection, racketeering, prostitution, gambling, extortion and pirated merchandise. However during the 1990s the group expanded its enterprise into legal avenues. Despite this move into seemingly more legitimate commercial waters, the group continues to expand its criminal repertoire, adding credit card fraud to its long list of illegal activities.

North Korea

North Korea has a population of approximately 23 million with Pyongyang the capital and largest city. North Korea is a single-party state led by Korean Workers' Party which was chaired by the Kim's family. The country has been described by some Western countries as a totalitarian state under the dictatorship of the Kim's family and has long been criticized for its lack of political and human rights. North Korea is one of the poorest countries in Asia, but still maintains one of the world's largest armies totaling 9,495,000 active, reserve, and paramilitary personnel, a hangover from the Korean war which ended in a stalemate in 1953. Korea was occupied since 1910 by Japan and divided in two by the World War 2 allied victors along the 38th parallel. The North invaded the South in 1950 which was rebutted by a UN force that led to an armistice 3 years later after bitter fighting and after China joined the war in support of the North.

In 1987 North Korean agents placed a bomb on [Korea Air Flight 858](#) killing 115. It is a nuclear-weapons state and has an active space programme, despite regularly having to rely on international food aid to feed its citizens. In 2006 in an attempt to persuade North Korea from developing nuclear weapons, UN, EU, US and other Western countries imposed various economic sanctions, such as a military and trade embargo, though the regime was still able to avoid restrictions to build its nuclear programme largely by working with the Proliferation network built by [Abdul Qadeer Khan](#). For more information see Part 1, Section 3, Money Laundering Laws and Regulations, Sanctions and Embargoes above.

According to a report released by a UN experts panel in July 2012, North Korea continues to violate UN sanctions by attempting to ship arms to Syria and Burma and illegally importing luxury goods. The Financial Action Task Force (FATF) issued a public statement on 16 February 2012 listing countries around the world which have significant deficiencies in their anti-money laundering regulations, one of which was North Korea. According to the FATF, the government of North Korea has repeatedly failed to take adequate steps in addressing serious shortcomings in the fight against money laundering and terrorist financing. FATF called on all its member countries to apply new counter-measures to protect national and international businesses from the continued and substantial risk of money laundering stemming out of North Korea. Corruption is widespread in North Korean society. North Korea is ranked 181 out of 182 countries in Transparency International's 2011 Corruption Perceptions Index. Whilst much of the nation lives in poverty and many require food aid, Kim Jung-Un, who succeeded Kim Jong-il in 2011, enjoys a luxurious lifestyle, allegedly he smokes Yves Saint Laurent cigarettes and loves Johnnie Walker whiskey and has a Mercedes-Benz 600 Sedan, rides horses and enjoys riding jet skis and imports consumer goods

like large screen TVs and other consumer electronics. According to a South Korean Parliamentary Report, the communist country's inbound shipments of luxury goods amounted to US\$322.5mio in 2009 before rising to US\$446.2mio in 2010 and US\$584.8mio in 2011. In addition to some legitimate exports and trade it is believed that the North Korean State is blatantly involved in criminal activity, in drug production and trafficking, initially opium and now meths, currency counterfeiting and arms dealing.

South Korea

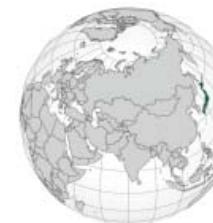

In the city of Seoul, South Korea is the local district of Gangnam, which means "South of the River". As of September 2013 the eponymous pop video 'Gangnam Style' had been viewed over 1.7 billion times.

The phrase 'Gangnam Style' is Korean term for someone enjoying a lavish lifestyle and is being used in a country that when the UN Secretary General, Mr Ban Ki-Moon was aged 6, at the beginning of the Korean War, was a byword for desolation and poverty. The name Korea is derived from the Goryeo dynasty which ruled in the middle ages. Its recent history involved conquest by Japan, then liberation followed immediately by being the battleground for the only "hot" war within the 'cold war'. One that involved the USA, USSR, China and others. In South Korea's early years it enjoyed virtually continuous economic growth even though it wasn't till 1987 that Civilian rule became the norm. Even today it has the world's most fortified border and the second highest number of soldiers per capita in the world. North Korea has the highest.

Criminal gang members in South Korea are known as Khangpae, literally meaning 'thug'. Criminal syndicates control large parts of South Korea's media, entertainment and even political activities. Today the two main criminal syndicates are the Seven Star Mob, and the HSS MOB. Another, the Double Dragon Mob has declined or gone underground. The HSS Mob is known to have links with Japanese, Brazilian, Chinese, US and Mexican gangs. Drugs, racketeering, prostitution and protection rackets form the main activity. Human Trafficking is an obvious adjunct to their overseas prostitution activities whilst money laundering has grown through the cover of construction businesses and gambling. They have also increasingly become part of legitimate business organisations.

Corruption is by any measure endemic in South Korea. Annually named and shamed by Transparency International, the criticism has also come from the Political and Economic Risk Consultancy's 2013 Report on Corruption in Asia which said that 'Korea is the most corrupt amongst developed nations in Asia'. The report also said that "the roots of corruption in Korea stretch to the highest levels of government and business".

Japan

Settled by migrants from the Asian mainland back in the mists of prehistory, Japan has seen the rise and fall of emperors, rule by samurai warriors, isolation from the outside world, expansion over most of Asia, defeat and rebound. One of the most war-like of nations in the early twentieth century, today Japan often serves as a voice of pacifism and restraint on the international stage.

The word "Japan" is commonly believed to have originated from Italian traveller Marco Polo (1254-1324) who described it in his book, "Il Milione". He called the country Cipangu, and this is said to be the origin of the word Japan (or Giappone in Italian, Japon in French, etc...), and is thought to be the name for Japan used in China, where Marco Polo picked up the name.

In 1603, after decades of civil warfare, the Tokugawa shogunate (a military-led, dynastic government) ushered in a long period of relative political stability and isolation from foreign influence. For more than two centuries this policy enabled Japan to enjoy a flowering of its indigenous culture.

Japan opened its ports after signing the Treaty of Kanagawa with the US in 1854 and began to intensively modernise and industrialise.

During the late 19th and early 20th centuries, Japan became a regional power that was able to defeat the forces of both China and Russia. It occupied Korea, Formosa (Taiwan), and southern Sakhalin Island.

In 1931-32 Japan occupied Manchuria and in 1937 it launched a full-scale invasion of China. The Japanese forces succeeded in occupying almost the whole coast of China and committed severe war atrocities on the Chinese population, especially during the fall of the capital Nanking. However, the Chinese government never surrendered completely and the war continued on a lower scale until 1945. In 1940, Japan occupied French Indochina (Vietnam) with the agreement of the French Vichy government and joined the Axis powers, Germany and Italy. These actions intensified Japan's conflict with the US and Great Britain which reacted with an oil boycott. The resulting oil shortage and failures to solve the conflict diplomatically made Japan decide to capture the oil rich Dutch East Indies (Indonesia) and to start a war with the US and Great Britain. To this end, Japan attacked US forces in 1941, triggering America's entry into World War II and soon occupied much of East and Southeast Asia.

On 27 July 1945, the Allied powers requested Japan in the Potsdam Declaration to surrender unconditionally, or destruction would continue. The ultimatum was rejected, leading to the dropping by US forces of two atomic bombs on Hiroshima and Nagasaki on August 6 and 9, and the Soviet Union entered the war against Japan on August 8. After its defeat in World War II, Japan recovered to become an economic power and an ally of the US and EU. While the emperor retains his throne as a symbol of national unity, elected politicians hold actual decision-making power.

Following three decades of unprecedented growth, Japan's economy experienced a major slowdown starting in the 1990s, but the country remains a major economic power. Japan is one of the most technologically advanced societies on earth; as a result, it has the world's third largest economy by GDP (after the US and more recently China).

Japan is home to about 127.5 million people. Today, the country suffers from a very low birth rate, making it one of the most rapidly aging societies in the world. The Yamato Japanese ethnic group comprises 98.5% of the population, with the others largely made up from Koreans (0.5%) and Chinese (0.4%), as well as the indigenous Ainu people, and an estimated 360,000 Brazilians and Peruvians of Japanese origin have also returned to Japan. 95% of Japanese citizens adhere to a blend of Shintoism and Buddhism.

The Japanese Archipelago includes more than 3,000 islands, covering a total area of 377,835 square kilometers. The four main islands, from north to south, are Hokkaido, Honshu, Shikoku, and Kyushu. Japan is largely mountainous and forested, with only 11.6% of its area arable land.

Japan has avoided mostly the attentions of terrorists, with the exception of the Japanese Red Army which was a communist militant group active in 1971 but largely closed down by 1972. The most widely reported attack by terrorists was carried out in 1995 with the Tokyo subway sarin attack, (5,500 injured, 12 dead), attributed to the cult [Aum Shinrikyo](#).

The most significant organised crime threat in Japan comes from the [Yakuza](#), with the largest [Yakuza](#) gangs in Japan today joined together in large syndicates. In Japan there are three main syndicates: the [Yamaguchi-gumi](#) (headquartered in Kobe), the [Sumiyoshi-kai](#) (Tokyo) and the [Inagawa-kai](#) (Tokyo). The dominance of these three syndicates has grown steadily since the 1970s and today they account for nearly three-quarters of the [Yakuza](#) population.

The [Yakuza](#) pursue money and power through extortion, intimidation, fraud, corruption, and a remarkably diverse range of criminal or near-criminal activities. Their main businesses are drug-dealing, smuggling, prostitution, gambling, and protection rackets. The two most

serious threats that the Yakuza pose to Japanese society today are their potential to disrupt the mainstream business world through corporate frauds and extortion rackets, and their harassment of the general public through loan-sharking, aggressive debt-collecting.

Two trends in Yakuza operations are apparent: a shift from traditional rackets toward white collar crime, and a shift from consensual activities (such as gambling and prostitution) toward more predatory activities (such as loan-sharking and theft).

While the latter problem is responsible for turning public opinion against the Yakuza, it is concern about Yakuza infiltration of the business world, and of the finance sector in particular, that has been the primary galvanizing factor behind the anti-Yakuza measures implemented over the last two decades.

Japanese Red Army - Japan

The Japanese Red Army was founded by Fusako Shigenobu in Japan in 1971 and attempted to overthrow the Japanese government and start a world revolution. Allied with the Popular Front for the Liberation of Palestine (PFLP), the group committed assassinations, hijacked a commercial Japanese aircraft, and sabotaged a Shell oil refinery in Singapore. On 30 May 1972, Kōzō Okamoto and other group members launched a machine gun and grenade attack at Israel's Lod Airport in Tel Aviv, killing 26 people and injuring 80 others. Two of the three attackers then killed themselves with grenades.

Aum Shinrikyo / Aum Supreme Truth - Japan

A religious cult with goals to rule the world was established in 1987 by Shoko Asahara, with up to 9,000 members in Japan and up to 40,000 worldwide, including in Australia, Russia, Ukraine, Germany, Taiwan, Sri Lanka, the former Yugoslavia, and the US, made its move in 1995 by attacking the Japanese subway.

In March 1995 Aum members simultaneously released the chemical nerve agent sarin on several Tokyo Subway Trains, killing 12 people and causing up to 6,000 to seek medical treatment. Subsequent investigations by the Japanese government revealed the group was responsible for other mysterious chemical incidents in Japan in 1994, including a sarin gas attack on a residential neighborhood in Matsumoto that killed seven and hospitalised approximately 500. Japanese police arrested Asahara in May 1995. He was charged convicted and paid the price when the death penalty was imposed and carried out in October 2007. Although Aum has not conducted a terrorist attack since 1995, concerns remain regarding its continued adherence to the violent teachings of founder Asahara that led AUM to carry out the 1995 sarin gas attack. Today the group still has members in Japan with a residual branch of about 200 followers who live in Russia.

Special Focus 12

Yakuza - Japan

Yakuza is the name given to organised criminal gangs from Japan. The Japanese police, call them bōryokudan literally "violence group", while the Yakuza call themselves "ninkyō dantai" "chivalrous organisations". The Yakuza are notoriously known for their strict codes of conduct and very

organised nature. They are very prevalent in the Japanese media and operate internationally with an estimated 100,000 members.

Yakuza are involved in Illegal gambling and prostitution as well as the smuggling of banned goods such as drugs and firearms. The Yakuza though are most well known for extortion or protections rackets, in which Yakuza threaten business owners and other citizens with violence unless they pay up. They even target large, listed Japanese Companies. In addition to illegal markets Yakuza also have interests in real estate, construction and entertainment. Japan's professional wrestling leagues and venues are particularly known for Yakuza involvement.

The Yakuza's most direct ancestors are groups of quasi-legal businessmen from the 18th century who gambled or peddled goods on the streets of large cities. Known as bakuto and tekiya, respectively, these gamblers and peddlers still lend their names to some Yakuza clans today. These groups gradually organised themselves into gangs known as families or clans, which had formal hierarchies and rules.

In the late 19th century, the Yakuza became associated with nationalist, militaristic ideologies and politics. Gangs cultivated alliances with politicians, and politicians used them to assassinate opponents, strong-arm trade groups or even fight in nearby nations like China. The disorder of post-World-War-II Japan may also have given the Yakuza an even stronger foothold in Japanese economics and politics.

The Yakuza is not a single organisation but rather a collection of separate gangs or clans akin to the American Mafia. These violent criminals have left their fingerprints on many aspects of Japanese life, from lowly gambling and prostitution rackets to the halls of high-level political and financial power.

The various gangs that make up the Yakuza have different origins, and the gangs' versions of these origins can

be quite different from the historical record. In their own vision of themselves, Yakuza descend from honorable, Robin-Hood-like characters who defended their villages from roving bandits. Some even claim to trace the Yakuza's lineage to Ronin, samurai warriors who found themselves without masters following a period of political upheaval in 17th century Japan.

Others claim that Yakuza instead originated with the kabuki-mono, "the crazy ones." These were wildly-dressed hoodlums who carried very long swords, intimidated entire villages and sometimes executed civilians for no particular reason. The truth is likely a blend of the two stories. Left without a military hierarchy to give their lives focus, many samurai turned to crime. Others moved into merchant trades or shadier businesses such as gambling houses and brothels. These criminals, master-less warriors and newcomers to the Japanese market system had one thing in common: they were all outsiders.

The name "Yakuza" reflects this outsider status. It comes from a Japanese card game called Oicho-Kabu. This game is similar to baccarat in that the point value of a hand is based on the final digit of the hand's score. A hand of eight, nine and three equals 20, which is worth zero points - the worst possible hand in the game. The Japanese words for eight, nine and three (ya, ku and za) became the word "Yakuza," meaning worthless or pointless.

A Yakuza family has a structure superficially similar to a Mafia family. A single patriarch rules the clan. He has various lieutenants, under-bosses and minor gang leaders beneath him in a roughly pyramidal structure. Regional leaders, assistants, advisers and an assortment of thugs further complicate the Yakuza clan structure. Some clans have a different structure -- they act as broad alliances that bring many smaller gangs under one umbrella.

The key to the hierarchy is the oyabun-kobun relationship, a set of father-son roles that binds all Yakuza clans together. In return for absolute loyalty and unquestioning obedience from his kobun, the oyabun provides advice and guidance along with protection and prestige. The focus on honor and tradition in Japanese society further cements these relationships. It also doesn't hurt that the punishments for failing the oyabun range from the humiliating (expulsion from the clan) to the gruesome (cutting off part of a finger). Each member of the clan may play both the oyabun and the kobun roles, acting as a subordinate to the Yakuza immediately above him and as a boss to the gangsters below him.

Entry into both an oyabun-kobun relationship and a Yakuza clan is marked by a special ceremony. A third person pours glasses of sake for the new member and his oyabun boss. The boss and new member drink some of the sake from their own glasses. Then, they exchange glasses and drink some of each other's sake. The boss

drinks his fill while the initiate merely sips.

Although many Yakuza clans have nationalistic ideologies, Koreans have a strong presence within the Yakuza. Koreans are sometimes looked down upon in Japanese society, which feeds into the Yakuza's outsider status. The profitability of smuggling goods between Japan and Korea also contributes to this Korean influence. Women are marginalized by the Yakuza. Even the daughters and wives of clan members tend to be little more than servants at best, and they're sometimes used as gang prostitutes.

Yakuza participate in many of the same money-making activities as all criminal gangs. Illegal gambling and prostitution are Yakuza hallmarks, while the smuggling of banned goods such as drugs, firearms and pornography is also profitable. The age-old protection racket, in which Yakuza threaten business owners and other citizens with violence unless they pay a tribute, is a common Yakuza tactic as well.

Japanese gangsters also operate legal businesses using the profits from the illegal ones. Real estate, construction and entertainment are all industries in which Yakuza have become involved. Japan's professional wrestling leagues and venues are particularly known for Yakuza involvement.

Higher-level Yakuza often play the Japanese stock market, sometimes legally. They may also find or invent incriminating information about a company and use this information to blackmail its board of directors. After buying shares of the company's stock, a clan sends some of its members to board meetings, where they threaten company officials with the release of the evidence. Yakuza can exert a great deal of control over businesses this way or simply demand payoffs.

Many Yakuza extortion and blackmail schemes are carefully designed to maintain the Japanese tradition of politeness. Yakuza may ask corporations to attend golf tournaments, give to fake charities or purchase certain items, all at ridiculously inflated prices. The corporations' leaders know that there is an implied threat with such requests, so they often go along even though the Yakuza never make a direct threat or demand.

Yubitsume, or the cutting of one's finger, is a form of penance or apology. Upon a first offence, the transgressor must cut off the tip of his left little finger and hand the severed portion to his boss. Sometimes an underboss may do this in penance to the oyabun if he wants to spare a member of his own gang from further retaliation. Its origin stems from the traditional way of holding a Japanese sword. The bottom three fingers of each hand are used to grip the sword tightly, with the thumb and index fingers slightly loose. The removal of digits starting with the little finger moving up the hand to the index finger progressively weakens a person's sword grip. The idea is that a person with a weak sword grip then

has to rely more on the group for protection—reducing individual action. In recent years, prosthetic fingertips have been developed to disguise this distinctive appearance.

Many Yakuza have full-body tattoos. These tattoos, known as irezumi in Japan, are still often “hand-poked”, that is, the ink is inserted beneath the skin using non-electrical, hand-made and hand held tools with needles of sharpened bamboo or steel. The procedure is expensive and painful and can take years to complete. When Yakuza members play Oicho-Kabu cards with each other, they often remove their shirts or open them up and drape them around their waists. This allows them to display their full-body tattoos to each other. This is one of the few times that Yakuza members display their tattoos to others, as they normally keep them concealed in public with long-sleeved and high-necked shirts. When new members join, they are often required to remove their trousers as well and reveal any lower body tattoos.

Although Yakuza membership has declined following an anti-gang law aimed specifically at Yakuza and passed by the Japanese government in 1992, there are thought to be more than 103,000 active Yakuza members in Japan today. Although there are many different Yakuza groups, together they form the largest organised crime group in the world.

Yamaguchi-gumi - Japan

The Yamaguchi-gumi was established in 1915 and is the biggest Yakuza family, accounting for 50% of all Yakuza in Japan, with more than 55,000 members divided into 850 clans. Despite more than one decade of police repression, the Yamaguchi-gumi has continued to grow. From its headquarters in Kobe, it directs criminal activities throughout Japan. It is also involved in operations in Asia and the US. Shinobu Tsukasa, also known as Kenichi Shinoda, is the Yamaguchi-gumi's current oyabun who took over in 2005 albeit Kiyoshi Takayama was in de facto control until recently until he too was imprisoned on extortion charges. Its success can be largely attributed to the organisation's long time oyabun, Kazuo Taoka who was seen and still regarded as an ultra-violent venerated mastermind of the group. Whilst based in Kobe, the group has expanded throughout Japan including in Tokyo.

Sumiyoshi-kai - Japan

The Sumiyoshi-rengo is the second largest Yakuza family, with 20,000 members divided into 277 clans. The Sumiyoshi-kai, as it is sometimes called, is a confederation of smaller Yakuza groups. Its current oyabun is Shigeo Nishiguchi. Structurally, Sumiyoshi-kai differs from its principal rival, the Yamaguchi-gumi, in that it functions like a federation. The chain of command is more lax, and although Shigeo Nishiguchi is always the supreme oyabun, its leadership is distributed among several other people.

Inagawa-kai - Japan

The Inagawa-kai is the third largest Yakuza family in Japan, with roughly 15,000 members divided into 313 clans. It is based in the Tokyo-Yokohama area and was one of the first Yakuza families to expand its operations to outside of Japan. Its current oyabun is Hideki Inagawa. Members often wear sunglasses and colourful suits so that their profession can be immediately recognised by civilians (kataji). Even the way many Yakuza walk is different from ordinary citizens. Their wide gait is markedly different from the unassuming way many Japanese prefer. Alternatively, Yakuza can dress more conservatively and flash their tattoos to indicate their affiliation when the need arises. On occasion, they also sport insignia pins on their lapels.

Dojin-kai - Japan

A Yakuza family centring its operations on the Japanese island of Kyushu, the Dojin-kai has become renowned for its drug trafficking, especially in methamphetamine. This is a sector that the Dojin-kai are alleged to have dominated in Japan since the late twentieth century. The Dojin-kai have also built a reputation for violent conduct in their affairs, exacting bloody vengeance on the Kyushu Seido-kai in particular for their defection. Today the group is believed to be led by Seijiro Matsuo.

Kyushu Seido-kai - Japan

Another Yakuza family based on the Japanese island of Kyushu, the group is believed to have 380 active members. The Kyushu Seido-kai originated as a splinter group of the Dojin-kai Yakuza family in 2006 and now forms one of five Yakuza syndicates based in the Fukuoka prefecture of Kyushu. An ongoing feud exists between the Kyushu Seido-kai and the Dojin-kai, resulting in the death of several Seido members. The Kyushu Seido-kai is characterised by its loan-sharking and drug trafficking operations, specialisations learnt during their time as part of the Dojin-kai's drug trading wing. As a result the Seido-kai are sometimes known informally as the ‘Seido Pharmacy’.

Central Asia

Central Asia is a core region of the Asian continent which stretches from the Caspian Sea in the west to China in the east, Afghanistan in the south, and Russia in the north. It is also sometimes referred to as Middle Asia, and, colloquially, “the stans” (as the five countries generally

considered to be within the region all have names ending with that suffix) and is within the scope of the wider Eurasian continent.

In modern contexts, all definitions of Central Asia include these five republics of the former Soviet Union: Kazakhstan (pop. 16.0 million), Kyrgyzstan (5.5 million), Tajikistan (7.3 million), Turkmenistan (5.1 million), and Uzbekistan (27.6 million), for a total population of 61.5 million as of 2009. Other areas often included are Mongolia, Afghanistan, northern Pakistan, northeastern Iran, Kashmir, and sometimes Xinjiang and Tibet in western China and southern Siberia in Russia. During pre-Islamic and early Islamic times, Central Asia was a predominantly Iranian region that included sedentary Sogdians, Chorasmians, semi-nomadic Scythians and Alans. The ancient sedentary population played an important role in the history of Central Asia. After expansion by Turkic peoples, Central Asia also became the homeland for many Turkic peoples, including the Kazakhs, Uzbeks, Turkmen, Kyrgyz and Uyghurs.

Central Asia is sometimes referred to as Turkestan. Since the collapse of the Soviet Union and the discovery of Gas, Oil, Gold and other Metals its strategic importance is becoming more and more recognised. Three of the Central Asian states border Afghanistan. Notwithstanding the conflict in Afghanistan the USA, Russia and India also have military bases in the Central Asian Republics. It is however of more specific strategic concern because of its proximity to Afghanistan which, aside from the current conflict there, has a near monopoly on the production of the world's opiate drugs; much of which passes through Central Asia on its way to Russia and Western Europe.

Many official views of governance in the Central Asian Republics are at best ‘diplomatic’ suggesting that these States are at the very early stages of transition from personal fiefdoms to democracies. In some alternative accounts they are described as vicious, corrupt, kleptocracies. The reality is that the Central Asia Republics are characterised by de facto dictatorships, (some benign some not so) who are in varying degrees accused of nepotism, corruption and the repression of press and

political freedom, amongst many other things.

The Economist Intelligence Unit produces a Democracy Index and the Central Asian Republics featured in 2011 as follows: Kyrgyzstan 107, Kazakhstan 137, Tajikistan 149, Uzbekistan 164, and Turkmenistan 165. As a comparator the lowest, North Korea, is at 167. Other Indices such as the Corruption Perception Index mirror the poor scoring for democracy, similarly the Press Freedom Index.

Transnational organised crime in Central Asia represents a serious threat to the region. Criminal organisations from Central Asia are often inaccurately described as part of the Russian Mafia. In fact they may use the Russian language, which is the lingua franca of the region, but they are very much a product of their own clans and tribes (or Hordes). As an example clans from the Great Horde dominate the Kazakhstan government. These tribal and clan structures go back many generations with family and clan relations serving as powerful organizing structures that can often be conducive to corruption – both for government personnel and organised criminals.

In 2007 an UNODC Report created a typology of Central Asian criminal groups which showed 6 categories which whilst it neatly classified these groups, the utility of that classification is only for academics. It did show however the sheer complexity of combating such groups and the adaptability and flexibility of their organisations, some of which though very insular have still formed links with other national and transnational organised crime groups.

According to the US State Department, there is significant evidence of organised crime in Kazakhstan. Many organised crime groups are also reported to have ties with similar groups in the US and Europe, Central Asia has also become an increasingly important area for illicit armaments trafficking linked to the conflict in Afghanistan. Human Trafficking is also a large and growing problem.

The UNODC reported that, according to the Kazakh authorities, the Izmailov organisation based in Moscow, along with Chechen and Ingush organisations and members of the Slavic “Thieves-in-Law” have attempted to re-establish the criminal tradition, of the “thieves’ code”, in Kazakhstan. Thieves in law are the elites of the post-Soviet era of organised crime and they formed as a society as a result of ruling the criminal underworld within the prison camps and are otherwise known as the ‘vory’. Other reports show inter-regional and international links being made with other organised criminal groups

Drug Trafficking is the main area of organised crime in Central Asia. The region with its porous borders acts as trans-shipment area for the so called “Northern Route” passing through its states for Russia and Western Europe. The International Narcotics Control Board

has estimates that 20% of the opiates coming out of Afghanistan pass through the Central Asia countries. US State Dept Narcotics Report 2012 mentions CAR states on the transshipment route, stating that "Afghan opiates pass through Kyrgyzstan's borders with Tajikistan, Uzbekistan, and Kazakhstan. The Kyrgyz Republic faces serious problems in monitoring its borders due to the topography of the country, of which 94% is mountainous." In addition, "one hundred thousand hectares of wild-growing cannabis in the country serve as a raw product source for local criminals for production of marijuana and hashish.

Central Asia is a transit point for illegal immigrants, in particular from South Asia..

Today, all countries in the C.A.R. States are either an origin, transit or destination point for trafficked children, some are all. Some trafficking is internal or cross border and often for labour use. Trafficking for sexual purposes exists and each state has laws to protect children but the problem is simply that children are at the bottom of the list for state help. Once again the litany of poverty, corruption, and organised crime leads inevitably to a degree of societal breakdown that worse affects the most vulnerable. Child prostitution and child pornography represent a lucrative area of business for organised criminal groups.

Arms' trafficking in Central Asia is linked to trafficking in drugs. For example, in Tajikistan, drug trafficking has been used for funding firearms purchases; with opposition militants buying drugs from Afghanistan, selling them in the Russian Federation and then returning to Afghanistan to purchase weapons. There is also a fear that various ethnic groups may be setting up arms dumps in anticipation of possible inter-ethnic conflict, particularly in the Ferghana valley, which stretches across Eastern Uzbekistan, Kyrgyzstan and Tajikistan. Islamist Groups such as Hizb ut-Tahrir are also one of several Islamist groups in the region. All smugglers however are armed and willing to use them thus exacerbating the porosity of borders. Border guards in any case are often priced into the transit costs of any goods whether goods, persons or cash.

The C.A.R States, like their Soviet predecessors, are concerned about the rise of Islamic groups some of whom have become radicalized and show an increasing capability of staging attacks. The main current terrorist threat in the C.A.R states is to Tajikistan which has a growing threat of insurrections both internally and externally. The main opposition party the Islamic Renaissance Party is alleged to be becoming more radicalised.

In fact all the classic hallmarks of creating dissent are there. In 2011 Tajik security forces were forced to make a temporary peace with warlords and insurgents in the eastern Rasht district who wish to see an Islamist Caliphate.

This peace is coming to an end and there is now a resurgence of the Islamic Movement of Uzbekistan (IMU), a group that is fighting in Afghanistan along with the Taliban. It is feared that many of the fighters in Afghanistan are closely linked to the IMU and will eventually turn their attention from Kabul to Tajikistan. On its own Tajikistan has virtually no capacity to control the 900 mile Tajik-Afghan border and the existing state apparatus is not strong enough to combat an insurgency. China will not want any insurgency to spread to the Uighurs in China or the Russians see it connect to the Caucasus. Pakistan will want to support its Sunni co-religionists but Iran will want to support its Shia brethren. The main terrorist threats in the region come from the Islamic Movement of Uzbekistan, and its offshoots or affiliates Hizb ut-Tahrir al-Islami, Hizb-an-Nusra; Akromiya; Jama'at al-Jihad al-Islami also known as the Jamaat of Central Asian Mujahideens (JCAM), and Islamic Jihad Group (IJG), all of whom are seen as Islamic terrorist organisations affiliated with Al-Qaeda that operates in the CAR region, being dedicated Other groups mentioned as relevant also include, the Kurdistan Workers Party, Lashkar-e-Toiba, Aum Shinrikyo and the East Turkestan Liberation Organisation. These Organisations are banned in one or more of the CAR states.
